5043	<p>An appropriate and fair EIS would provide similar alternative scenarios to compare. A gondola from the bottom of LCC with a feeder bus is not comparable to a rail alternative from the middle of the valley in an exclusive corridor up LCC. Clearly the residential impacts of rail in the 'city' are significant. The report should have used the same feeder bus alternative as the gondola. Additionally, the author placed the Rail alternative in an exclusive alignment when it clearly could have been placed in the same location of the bus-only lane. These biased, unbalanced and unequal comparisons raise serious questions.</p> <p>The protection from avalanches is not the only safety factor to be considered. The report Does Not consider the safety of riding in a particular more. Why was this? It is a standard level of professionalism that was not applied.</p> <p>A big advantage of railways is its adaptability to fit into any built environment. Historically, the road in the upper parts of the canyon are built on top of the LCC railway that was constructed and operated over 100 years ago.</p> <p>The Pikes Peak Cog Railway in Colorado is being built for \$110 M or \$12 million per mile. It has many of the same characteristics that are applicable to LCC. There are many examples and lessons learned that Utah should apply to this analysis.</p> <p>A Cog rail can be constructed adjacent to the roadway with state-of-the-art construction that minimizes impacts and costs. A Cog railway can be built as a diesel system and converted to electric in another phase.</p> <p>Overarching Issues</p> <p>1-UDOT is certified by FHWA to prepare and sign Federal Highway Environmental Impact Statements (EIS). The content of this report is so erroneously written and professionally wrong that UDOT could lose this privilege. The deficiencies in this report could easily be legally challenged by opposing parties.</p> <p>2-Alternatives are not equally addressed and evaluated. The report is clearly biased towards making some alternatives look better than others. In order for alternatives to be fairly compared, they need to have a similar basis. You cannot compare a rail line from 9400 S. and 2000 E (with urban traffic and residential/business issues) with a gondola at the base of Little Cottonwood Canyon fed by buses from 7200 S. and Wasatch Boulevard.</p> <p>3-There is no forecast for future use. This is unprincipled. The report just simply tries to compare modes to match a certain hourly capacity. Major capital transit Investments require knowing what your build-out future year ridership is.</p> <p>4-It is bad public policy to plan and design major capital expenditures for a peak seasonal use. You would not expect to invest significant public monies in a transportation system that only satisfies a couple of private businesses for a few months per year. Typically, highways are designed for the 30th highest traffic counts. Public transit systems are expected to be used year-round and the public should expect to know the impacts during the off-peak seasons. For example, there is no discussion on what to do with the bus system during the non-ski season.</p> <p>5-The report does not respond to its own purpose and need. This is a typical Achilles heel for EISs. For example, the report should have evaluated all the safety factors that might impact the Little Cottonwood Corridor, yet the only safety criterion it evaluates is protection from avalanches. Although this is an important feature, the report totally disregards the larger safety picture. An evaluation of the safety of driving on the road is completely missing as is a comparison of safety between transit modes. As another example, there is no discussion of the safety aspects of evacuating patrons from a disabled gondola between towers. Additionally, the report does an inadequate job of addressing congestion relief. It does not address the impact of those cars and buses coming to a base lot and feeding a gondola. The report mentions a 2,500-car parking lot would be needed at the mouth of BCC. It ignores the travel issues in BCC and fails to point out that additional stalls would be required for BCC. External travel trips are typically included in EISs. This would bring this parking lot total closer to double its recommended size (potentially 5,000 cars!).</p> <p>6-The report appears to ignore an overwhelming number of comments that support including rail as an alternative. This reflects a clear bias of the report.</p> <p>7-Many of the transit costs and issues are incorrect or all together ignored. A typical problem with transit is deadhead time and costs. The public hates seeing empty buses. The report fails to address the massive expense of taking a large fleet of buses from a central garage and deadheading them throughout the day. It uses NTD data base for bus operating costs which reflect the cost of running buses in the city. It is NOT the same as running in the canyons.</p> <p>8-Most striking is the discussion on frequencies. The report refers to a train running every 15 minutes, a bus running every 2 ½ minutes (or 1 ¼ minutes in both directions) and a gondola every 25 seconds (or virtually a string of gondola cars in both directions). This suggests that at any one point in time, there would be either 3 trains or 48 buses or 120 gondola cabins. This translates to a gondola cabin every 800 feet (or 400 feet in both directions) from end of the canyon to the other. The report ignores these visual impacts.</p> <p>9-The report's cost estimates for rail are wildly inflated. Contemporary estimates are about \$58 million per mile and Pikes Peak COG Railway in Colorado is being built for far less -\$12 million per mile. This is substantially less than the report's estimate of \$138-\$169 million per mile. Additionally, while the overhead costs for the gondola are only 10%, the report uses a whopping 47% increase in costs for overhead on the rail. This is hundreds of millions of dollars in unnecessary costs.</p> <p>10-The report reads more like a justification for a solution than a document for evaluating alternatives</p> <p>11-The report started out with a discussion on how to mitigate avalanche impacts and morphs into a full blow major transit capital alternative analysis with apparent change in purpose and need or evaluation criteria. This is a fundamental flaw.</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Michael Allegra	Website
5044	I am in support of increasing bus transportation in the cottonwood canyons, but not building a gondola. I believe the environmental impact, amount of time, possible disruption of already crowded roads/traffic in the area, & possible contamination of our watershed is too great of a concern to be okay with having a gondola built.	Mackenzie Marmol	Website
5045	I am in favor of the gondola. Let's see UDOT continue their support for alternate forms of mobility in Little Cottonwood Canyon.	JEFFREY HUFFMAN	Website
5046	I would advocate we DO NOT go with the gondola as it's limited use. The enhanced bus service (including the widening) seems like a much more practical way of handling this and certainly have my vote.	Philip Luedtke	Website
5047	The Gondola Plus with La Caille base station is the best long term option.	Brodie Reid	Website

5048	Please consider the gondola works plan as a option, to help unload the canyon road. Dear Utah Department of Transportation, I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Ms. Shelby Sly	Craig Henry	Website
5049	 As a climber, lift service snowboarder, and backcountry splitboarder I utilize LCC on nearly a daily basis. I fully support enhanced bus service (similar to Zion event!) without an additional bus lane. I think this will provide the cleanest and least impactful solution while allowing for multiple stops and minimizing independent user traffic. I support the gondola option. Buses will struggle to be effective because hiring 100 drivers seasonally is difficult. The gondola may pay for itself over time as people pay to ride, similar to the Snowbird tram. It is the option that would actually take vehicles off the road. Bus service as it stands should continue to see improvements and possible expansion of summer routes. One thing I noticed is that recreation stops and road use by the rock climbing and cycling communities was not well represented. They use the canyon differently and at additional locations. Bus routes that are direct all the way up from the mobility hub do not serve all needs. Please consider the La Caille base stop or a redesign of the current gondola scenario that leaves from a mobility hub or some kind of parking where a bus could pass and users could be dropped off. I live on Kings Hill Drive. I would rather see the speed limit reduced, and leave the rest alone. Speed seems to be the biggest danger to me. Thanks! Sure the gondola would be glamorous. But what would the round trip ticket cost? And why would we want to have so many visitors to LCC? Seems like a great ploy for some business entity to make a lot of money. We already have a road, we already have buses-why not make the most out of both. And then there is COVID to consider- we could not possibly invite enough people at a time to ride the very expensive gondola safely. Yes, COVID will eventually be vanquished, but what about the next pandemic... The Gondola PLUS the La Caille Base Station is the most forward-thinking solution for Little Cottonwood Canyon. All signs point to it as the obvious choice! First, as a local canyon lover I appreciate the work that has gone into the creation of the three options at hand. Any of them would help in solving the congestion issues in the canyon, specifically in the winter. The gondola option stands above the others for several reasons: (1) it would reduce the overall emissions within the canyon by decreasing the number of cars that utilize the road, (2) it will eventually be the least expensive and safest option once initial build costs and annual O&M costs are factored in (after roughly 25 years), (3) it allows travelers to experience the canyon in a way never before - thus further giving people a richer appreciation for this natural resource. Thank you for listening and for taking the time to look into ways to help protect the canyon for future generations. I can appreciate each of the 3 options, but none of them seem to really solve the problem. Buses are not the answer, even with dedicated lanes buses will be impacted by road closures and poor driving conditions. Getting to the resorts as quickly as possible is what skiers/boarders want, they are not going to sit and wait for a bus that will not get them there any faster than driving up the road themselves. People want a solution they can count on, one that is consistently reliable. They expect reasonable wait times with the least amount of inconvenience. On an average day the drive to Snowbird from one of the park and rides takes about 20 minutes. The convenience factor of the gondola needs to include a short wait time, people are not going to line up to wait 30-45 minutes for a gondola ride that takes twice as long as driving. The proposed gondola offers 1 cabin carrying 30 people leaving every 2 minutes, this will not cut it. A reasonable solution needs to accommodate at least twice as many skiers per hour. It seems to me that the gondola that was proposed a while back would be the best option and least impact on the environment and surrounding area in the canyons. First of all, a huge thanks to UDOT, UTA and the Forest Service for working to protect our beautiful Wasatch canyons. As a year-round user of Little Cottonwood (and Big Cottonwood) Canyon, I would support the plan for enhanced bus service, and to limit or meter the number of cars allowed in the canyon. Enhanced bus service is the most flexible, scale-able and fungible plan. With dedicated bus service, traffic could move smoothly and transport time would be minimized, but widening the road negatively impacts the environment and unless you limit the number of cars, will only create more bottlenecks and slow downs for of all the traffic. Thank you for considering an enhanced, virtually bus-only plan. The proposed solutions don't allow Backcountry users (skiers, climbers, hikers, bikers...) enough access points. We would be walking up and down to get to areas. Usage at areas where there is access would have a greater impact at those areas and would ruin things and make it intolerable. Eliminating as much traffic as possible from the Canyon would be the best option for people, animals and the environment. The Gondola plus La Caille option would be the best way to manage traffic at the base and get skiers and riders up the canyon quickly and pollution and stress free. Addressing this issue is long overdue, and the option chosen should not be a halfway measure, but rather one that will fulfill the needs well into the future. Traffic on the road should be limited to commercial needs, and not include buses or private cars. I prefer the extra lane for carpool or bus with snow sheds All for the Gondola! Keep cars (and emissions) out LCC! The gondola is the best solution I have seen. Focus on powering it with renewables. Model it like Telluride and Zermott. Finally #3 will be like the systems in Europe that work so well. I think having buses as a backup/optional transportation are necessary. #3 option is the best solution More buses immediately and a parking lot near mouth of the canyon for people catching the bus!! The Little Cottonwood transportation development options that include a gondola are too ski-resort centric. Unless the gondola plans are modified to include stops at ALL backcountry access trailheads, then it is not a sufficient solution. I am extremely in favor of increasing bus availability in the canyon as well as converting to electric based buses for use in the canyon. Increased coverage for summer useage should also be considered. To a lesser extent, I am in favor of widening the road, although I think that will only cause more problems as it will allow more people to enter the canyon via automobile while there is not sufficient parking for these additional visitors. I am very concerned about the impact of a gondola as well as the cost. I would rather that that money be used to implement the enhanced bus option. I also believe there should be a toll for the canyon and the funds collected should be used to offset the cost of riding the bus. The IKON pass has ruined it for the locals. There should be no idling in neighborhoods and busses should be the first vehicles up the canyon after avalanche control. No to the cost of the gondola. The ticket price will have to be too high and no one will want to ride it. I support the gondola instead of widening the road I support constructing the gondola instead of widening the canyon road. I'd like to vote for the Gondola option as I believe this to be the way of the future in SLC. With the existing emissions issue, why not continue to cut down on emissions in the winter by implementing this Gondola. I also would like to ensure that with whatever option is pursued, there is opportunity to get off the Gondola/Busses at popular Backcountry ski locations. I strongly support the Gondola Plus La Caille base station solution to mitigate the nightmarish traffic we are currently experiencing in Little Cottonwood Canyon. Please implement this more effective solution. It's the best idea anyone has come up with. Forget the gondola, widen the road, build avy tunnels, and charge \$50 a year for a canyon pass to help pay for expansions. Also parking garages at the bird and Alta and increased bus services I support the gondola. Please pursue this. We have enough pollution and traffic. I feel that an increase in bus transportation availability in order to reduce personal passenger vehicles in LCC is a positive, but the bus system and road widening does not account for other recreation types during other times of the year in the canyon: such as hiking, climbing, mountain biking, during the spring, summer, and fall period. If an increase in bus services and mobility stations were implemented, with the current plan status, it is not helpful without having additional stop stations besides Alta and Snowbird. I don't feel that we should go forward with a plan that cater specifically to private companies and costly sports within a canyon that is enjoyed by a broader base of the salt lake city community. If we are going to increase access to public transport into the canyon, it should include the following: 1.stops at major climbing/hiking trail heads in the non-winter months Additionally, the gondola plan I feel is out of the question, would ruin the pristine views of our canyon, and again, only benefit privatized winter sport recreation. I also would like to ensure that with whatever option is pursued, there is opportunity to get off the Gondola/Busses at popular Backcountry ski locations. I strongly support the Gondola Plus La Caille base station solution to mitigate the nightmarish traffic we are currently experiencing in Little Cottonwood Canyon. Please implement this more effective solution. It's the best idea anyone has come up with. Forget the gondola, widen the road, build avy tunnels, and charge \$50 a year for a canyon pass to help pay for expansions. Also parking garages at the bird and Alta and increased bus services I support the gondola. Please pursue this. We have enough pollution and traffic. I feel that an increase in bus transportation availability in order to reduce personal passenger vehicles in LCC is a positive, but the bus system and road widening does not account for other recreation types during other times of the year in the canyon: such as hiking, climbing, mountain biking, during the spring, summer, and fall period. If an increase in bus services and mobility stations were implemented, with the current plan status, it is not helpful without having additional stop stations besides Alta and Snowbird. I don't feel that we should go forward with a plan that cater specifically to private companies and costly sports within a canyon that is enjoyed by a broader base of the salt lake city community. If we are going to increase access to public transport into the canyon, it should include the following: 1.stops at major climbing/hiking trail heads in the non-winter months Additionally, the gondola plan I feel is out of the question, would ruin the pristine views of our canyon, and again, only benefit privatized winter sport recreation.	Hal Miller	Website
5063	And then there is COVID to consider- we could not possibly invite enough people at a time to ride the very expensive gondola safely. Yes, COVID will eventually be vanquished, but what about the next pandemic... The Gondola PLUS the La Caille Base Station is the most forward-thinking solution for Little Cottonwood Canyon. All signs point to it as the obvious choice! First, as a local canyon lover I appreciate the work that has gone into the creation of the three options at hand. Any of them would help in solving the congestion issues in the canyon, specifically in the winter. The gondola option stands above the others for several reasons: (1) it would reduce the overall emissions within the canyon by decreasing the number of cars that utilize the road, (2) it will eventually be the least expensive and safest option once initial build costs and annual O&M costs are factored in (after roughly 25 years), (3) it allows travelers to experience the canyon in a way never before - thus further giving people a richer appreciation for this natural resource. Thank you for listening and for taking the time to look into ways to help protect the canyon for future generations. I can appreciate each of the 3 options, but none of them seem to really solve the problem. Buses are not the answer, even with dedicated lanes buses will be impacted by road closures and poor driving conditions. Getting to the resorts as quickly as possible is what skiers/boarders want, they are not going to sit and wait for a bus that will not get them there any faster than driving up the road themselves. People want a solution they can count on, one that is consistently reliable. They expect reasonable wait times with the least amount of inconvenience. On an average day the drive to Snowbird from one of the park and rides takes about 20 minutes. The convenience factor of the gondola needs to include a short wait time, people are not going to line up to wait 30-45 minutes for a gondola ride that takes twice as long as driving. The proposed gondola offers 1 cabin carrying 30 people leaving every 2 minutes, this will not cut it. A reasonable solution needs to accommodate at least twice as many skiers per hour. It seems to me that the gondola that was proposed a while back would be the best option and least impact on the environment and surrounding area in the canyons. First of all, a huge thanks to UDOT, UTA and the Forest Service for working to protect our beautiful Wasatch canyons. As a year-round user of Little Cottonwood (and Big Cottonwood) Canyon, I would support the plan for enhanced bus service, and to limit or meter the number of cars allowed in the canyon. Enhanced bus service is the most flexible, scale-able and fungible plan. With dedicated bus service, traffic could move smoothly and transport time would be minimized, but widening the road negatively impacts the environment and unless you limit the number of cars, will only create more bottlenecks and slow downs for of all the traffic. Thank you for considering an enhanced, virtually bus-only plan. The proposed solutions don't allow Backcountry users (skiers, climbers, hikers, bikers...) enough access points. We would be walking up and down to get to areas. Usage at areas where there is access would have a greater impact at those areas and would ruin things and make it intolerable. Eliminating as much traffic as possible from the Canyon would be the best option for people, animals and the environment. The Gondola plus La Caille option would be the best way to manage traffic at the base and get skiers and riders up the canyon quickly and pollution and stress free. Addressing this issue is long overdue, and the option chosen should not be a halfway measure, but rather one that will fulfill the needs well into the future. Traffic on the road should be limited to commercial needs, and not include buses or private cars. I prefer the extra lane for carpool or bus with snow sheds All for the Gondola! Keep cars (and emissions) out LCC! The gondola is the best solution I have seen. Focus on powering it with renewables. Model it like Telluride and Zermott. Finally #3 will be like the systems in Europe that work so well. I think having buses as a backup/optional transportation are necessary. #3 option is the best solution More buses immediately and a parking lot near mouth of the canyon for people catching the bus!! The Little Cottonwood transportation development options that include a gondola are too ski-resort centric. Unless the gondola plans are modified to include stops at ALL backcountry access trailheads, then it is not a sufficient solution. I am extremely in favor of increasing bus availability in the canyon as well as converting to electric based buses for use in the canyon. Increased coverage for summer useage should also be considered. To a lesser extent, I am in favor of widening the road, although I think that will only cause more problems as it will allow more people to enter the canyon via automobile while there is not sufficient parking for these additional visitors. I am very concerned about the impact of a gondola as well as the cost. I would rather that that money be used to implement the enhanced bus option. I also believe there should be a toll for the canyon and the funds collected should be used to offset the cost of riding the bus. The IKON pass has ruined it for the locals. There should be no idling in neighborhoods and busses should be the first vehicles up the canyon after avalanche control. No to the cost of the gondola. The ticket price will have to be too high and no one will want to ride it. I support the gondola instead of widening the road I support constructing the gondola instead of widening the canyon road. I'd like to vote for the Gondola option as I believe this to be the way of the future in SLC. With the existing emissions issue, why not continue to cut down on emissions in the winter by implementing this Gondola. I also would like to ensure that with whatever option is pursued, there is opportunity to get off the Gondola/Busses at popular Backcountry ski locations. I strongly support the Gondola Plus La Caille base station solution to mitigate the nightmarish traffic we are currently experiencing in Little Cottonwood Canyon. COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5086	<p>I strongly believe the Enhanced Bus with no widening Hwy 210 option is the best for LCC because it has the lowest environmental impact (no additional infrastructure/ machines have to go into LCC and work around the watershed, we are adding more buses-hopefully low emission buses that PC uses. This option not only serves the resort/ tourist crowd but serves the climbers, backcountry skiers and does not disrupt the beautiful landscape that makes LCC incredible. This option also allows us to help solve the problem this upcoming season instead of making the problem worse for years until the road is widened or the gondola is built. The issue that we are trying to solve is only for a few months out of the year.</p> <p>The main issues I see in all the alternatives is that they do not address parking, all the options have several transfers-making it a failure before even implementing any option. The gondola mobility hub will have about 2,500 spaces for cars. Being that it is located at the mouth of Big Cottonwood, will this still be a carpool lot or exclusive to LCC? If you live in Granite, Sandy or Draper, you'll have to drive past Little Cottonwood to Big, where you'll enjoy the traffic you are trying to escape before getting on a bus heading back toward whence you came, to then catch the gondola. Where are we putting a parking structure? why can't we have bus transit hubs from Sandy, UofU, Sugarhouse, DT that go directly to the resorts?</p> <p>Gondolas are made for where there are not roads or where there can't be roads, LCC has a great road already in place and we should utilize what we already have! There is a risk avalanches while driving up the canyon for people that live along the canyon and drive up the canyon and I would say that what make LCC unique and we need to keep that, and if they don't want that risk then there is PC, canyons and other ski resorts.</p> <p>Why I strongly disagree with the gondola is that gondolas shut down in weather- the PC to canyons gondola is closed several days during the winter season where they are forced to bus people back and forth during bad storm days. where is everyone going to go if the gondola shuts down? where is everyone going to stay if LCC is in interlock? We also don't need to have a gondola to make a LCC amusement park- with three transfers the "cost" or "efficient factor" is out the window. To attract more people means more traffic and more of a problem. Also if people are talking long term- in 50 years with global warming are we going to have a ski season? Lets keep LCC beautiful and the skiing experience/ LCC experience special and utilize the infrastructure we already have in place and add more buses, spread it to hubs around the valley and make it easy for people to ride the bus. The problem we have now is when people try and take the bus they are stuck at Alta for hrs trying to get on a bus down, if we make it easy and reliable locals and visitors will take the bus! I heard in the 80's there was a \$7 round trip ski bus from 9th and 9th to LCC, why can't we do that again? I hope we can use the tools we already have to help solve our traffic problem that is really only an issue 4 out of 12 months/ year. Also as a tax payer I do not want to pay for any additional infrastructure except for additional parking lots or additional bus hubs that can take people from their neighborhood to the resort our allow carpooling and make riding the bus easy and accessible.</p>	Mackenzie Jones	Website
5087	<p>Hi Josh, Thanks for your time and conversation. As we discussed, there are several items upon which I would like to comment. These comments are in the attached memo. Please feel free to reach out to me to discuss further if you wish.</p>	Newel Jensen	Email
5088	I live near the mouth of Big Cottonwood. I do not support widening Wasatch Blvd to 4 or more lanes. I do not see how making travel to the mouth of LCC solves any problems, whatsoever. I do support buses in LCC. I do not feel a gondola will solve the traffic problems. I also feel the ski industry should foot most of the bill for improvements that benefit their industry.	susan Ayers	Website
5089	Please use the gondola and consider the options of extending to other canyons and the La Caille station. We only have a limited resource and expanding into our beautiful canyons for more polluting busses and cars will destroy our unique canyons. There's a way if we are creative and work together!!	Natalie Woodbury	Website
5090	I would do both the Gondola and the five lane plan. -Glen	Glen Hartman	Website
5091	I am a road cyclist and runner of over 40 years and live just west of Wasatch between the 2 Cottonwood Canyons. Because of my location, I ride and run along Wasatch almost everyday. As you know, This corridor is the major route taken by cyclists and runners in the East part of the valley. It is also heavily traveled by motor vehicle traveling at high speeds 50 and above). The area of greatest risk is between Big and Little Cottonwood. Cars and big trucks pass dangerously close to cyclists. The shoulders are not as wide as other portions of Wasatch. This combination poses as great risk to pedestrians, runners and cyclist. I would hope that The planners would slow the speed of traffic and especially widen or even segregate the bike lanes from traffic in any new design. Also, the bike through lane approach is too short for traffic going up the canyon at the intersection for southbound Wasatch. This recent re-engineering was not successful. It forces cyclist to be exposed to traffic from behind as they try to get over to the bike through lane without even protection for their lane from through or right turn traffic.	Mark Williams	Website
5092	Thank you, Mark J Williams		
5093	I rode the Ski Bus all last season. The Ski Bus is under utilized. Usually, there was room for more riders going up and coming down. Thank you. I've lived in Cottonwood Heights for 25 years. I don't want to see either canyon take on more traffic & pollution.	Michael Vahle	Website
5094	Go For the Gondolla Dear sir or madam: Please find attached our comments. Thanks, Dave & Penny Smith	Melinda Stowers	Website
5095	As an avid user of both Big and Little Cottonwood Canyons, I have first hand frustrations with traffic issues as well as a persistent desire to continue to explore and play in our wild, undeveloped canyons. The solutions proposed are thoughtful, but have several flaws. The problems: (1)Limited parking at the base of the canyon restricts the potential success of any proposed solution to limit private traffic in the canyon. Without easily accessible locales for parking, any carpool or public transit option is less likely to be used. At the bases of both Big and Little, carpool lots are usually full by 9am on high traffic winter days. Without access to a parking spot, users will not leave their cars to take busses (regardless of increased frequency or decreased transit time with dedicated bus lanes) or a public gondola. (2)Gondola access only supports users at ski resorts. (3)Widening the roadways will have irreversible consequences on the ecosystem, development, and aesthetic of the canyon. Additionally, widening the roads will not alleviate the ever-increasing amount of traffic running through the canyon. This is, at best, a temporary solution to a long-term problem. (4)Any restrictions in Little Cottonwood will pass traffic to Big Cottonwood, which, while not as severe, has its own traffic problems. Proposed Ideas: (1)Tolling a.A driving pass for both Little and Big Cottonwood Canyons. Since changes in one canyon will undoubtedly affect both, let us not postpone addressing the issues that will trickle down. Users of the canyons can purchase a season pass allowing car access into the canyon. To purchase this pass, you must have documentation that your car is 4WD or AWD and has appropriate tires or chains. b.If you do not have a pass, your car must pass tire inspection and you must pay a day use fee, much like Millcreek Canyon. c.To maximize traffic flow, there may be an "easy pass" lane at the base of the canyon abutted to a human operated lane. There should be a fine for cars in the easy pass lane without the appropriate pass, enforced by camera. d.Discounts or complementary passes could be provided to homeowners and employees. Restrictions on vehicles should remain the same. (2)Parking structures at the base of first Little, then Big cottonwood canyon. Additional parking spaces, combined with financial incentives to drive independently, will encourage users to utilize carpooling and public transit. (3)Increased public transit (busses), with stops at popular backcountry trailheads and ski resorts. Thank you for your attention to our canyons and outdoor recreation opportunities.	Ivan Hodges	Website
5096	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing (according to information provided by your website). That being said, there is still extensive analysis needed that considers dispersed recreation in this Alternative.	Zack Taylor	Website
5097	Of the three alternatives, I prefer the Gondola. The reasonable initial investment, lowest ongoing cost, and highest capacity make this the best option from my perspective. I also like that it is the lowest impact to the land.	tony calderone	Website
5098	Growing up in Salt Lake, I have visited Little Cottonwood Canyon hundreds of times. The growth in Salt Lake country has had a noticeable impact on the environment of the canyon, along with the ability to enjoy all its beauty, due to smog/pollution, traffic and no where to park. I support the Gondola!	Skye Cowdell	Website
5099	Dear Utah Department of Transportation, I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Mr. Kane Boynton	Kane Boynton	Email
5100	The Gondola Plus La Caille Base Station is a way to get cars out of the canyon and off Wasatch Blvd. We need this for our community and air!	Becky Fleming	Website

5101	<p>Hello again, since you guys are now towards finalizing the decision on fixing the canyon I want to make some points as to why avoiding a gondola will be better.</p> <p>1. The main problem with the canyon traffic lies with the industry surrounding it, and with the Ikon Pass available at all cottonwoods resorts it is making that problem worse. The big problem us outdoor people have seen is just out of state traffic coming in, not that it is a bad thing but the removal of the ikon pass would literally, like fucking literally change how the road looks on a daily basis. But since you guys don't wanna push the resorts to do that and help keep the locals happy with fresh untracked turns, I'm gonna suggest avoiding the gondola and using more busses for moving people. On a good sunny weekend the difference in adding a few more busses would be incredible and likely more effective than the gondola. The only benefit to the gondola is on stormy days when the road has to close, otherwise there will be weather interfering with it and also long lines to get onto the tram itself, it's only adding to the pain of the 9 fucking mile drive. The gondola will only ramp up the amount of people in the canyon, and to the vast amount of locals an untracked turn is becoming rare because of the ikon pass and soon the gondola. Please realize you're only feeding into a traffic problem with people up at the resorts, oh and hikers and backcountry skiers like myself don't appreciate taking down any piece of land on that road to put a lift tower in our way. This can affect how wildlife will function in the mountains, and also make an obstacle for people outdoors and just an eyesore for the people living in the canyon. Please realize that using busses, especially electric will actually do something instead of rip up ground to build what will be referred to as "the beater hauler" which means endless beginners who shouldn't ski in terrain like LCC will flock to Utah and only ruin the life experience of those fortunate enough to live here.</p>	Collin Titus	Website
5102	Fuck the gondola if you have a problem talk to me, we aren't in fucking Switzerland it's a 9 mile road, we don't need a gondola.	Kirsten Henderson	Website
5103	I vote for the Gondola alternative. Better for the environment, better looking, better represents the mountain feel that other mountain towns have.	Mary Jo Tarallo	Website
5104	<p>I fully support the idea of building a gondola to access Little Cottonwood Canyon. Can't see any downsides to this; only upsides. Kudos and good luck!</p> <p>I think there are three major causes of traffic problems in LCC</p> <ol style="list-style-type: none"> 1) Big snow days and Avalanche danger: Snow sheds will make this much better. They will get the mountain open sooner and solve the traffic backup problem. 2) Big snow days and poorly equipped cars: Enforce the snow tire rules. Issue window stickers to cars with snow tires, setup a booth at the bottom, cars with a sticker can go right up and the other cars will pull to the side for tire inspection. This will speed up the process. M&S tires are not good enough. Require true snow tires and AWD/4WD. Getting past sliding/skidding/stuck cars slows everyone down and makes traffic. 3) High volume days: These are mostly holidays and weekends. These days are predictable and you can schedule more buses. You need express buses to each of the Alta and Snowbird stops. If you are going to Albion having to stop at all those other places first is a frustrating waste of time. <p>I don't think a toll is going to get tourists to ride the bus. If a tourist is already spending \$500+ per day per person how big would the toll need to get them to take a bus? They will pay it and traffic won't be improved. The only way a toll might reduce tourist traffic is by pissing them off and sending them to Colorado for their next ski trip.</p> <p>First, I don't think the 3 options presented have been sufficiently researched. Further studies are needed to understand the true impact and provide a more accurate capacity picture.</p>	todd schreibman	Website
5105	<p>Of the 3 options presented, I would be most in favor of an enhanced bus route. There are multiple benefits from this, but I will highlight that it has the lowest environmental impact and is inclusive to all types of canyon users. Furthermore, if this is going to be funded predominately by the taxpayers, it should serve all possible uses rather than just those that use the ski resorts.</p> <p>I'm shocked widening SR 210 is being considered: perhaps UDOT should stop ignoring how adding lanes eventually leads to induced demand. Adding additional lanes encourages more people to drive and eventually you end up with the same congestion seen before. As a side note, maybe consider this as you continue to promote sprawl in the Salt Lake Valley.</p>	Will Gere	Website
5106	Hello, I feel strongly that the gondola solution is far superior to the other options. It is more environmentally friendly and meaningfully forward looking.	David Black	Website
5107	Thank you, David Black		
5108	I support enhanced bus service with the addition of a dedicated bus lane.	Barbara Eastman	Website
5109	<p>please seriously evaluate the option of a gondola to access little cottonwood canyon resorts - it would be much more ecologically sustainable vs. more and more cars up the canyon.</p> <p>After reviewing EIS materials and attending one of the virtual townhall meetings, these are my questions and comments, and I will relate them to the statement of purpose in the Project Overview, "The partners seek to deliver transportation options that meet the needs of the community while preserving the value of the Wasatch Mountains."</p> <p>LONG-TERM TRANSPORTATION NEEDS. I understand that the scope of this analysis is to decrease the personal vehicle traffic by 30% up LCC. I understand that this scope is probably fixed at this point, but I hope that the next phase of the EIS will consider that this may not be enough for a truly long-term solution and will consider alternatives that can be adjusted or expanded for the future. As such, I believe the Gondola to be of limited application. It appears to be a fairly fixed mode of transport that cannot be easily expanded or adjusted (for more capacity, more frequent stops, etc.) and therefore will not continue to serve the needs of canyon travel. Given our poor air quality and probable growth along the Wasatch front, I believe that we will eventually need to decrease our strong dependency on personal vehicles. Starting with enhanced bus services over a gondola allows us to test public transport up the canyon in a way that can be more easily adjusted, expanded, integrated more directly into valley public transit systems, and allow us to use the existing road as we, in my opinion inevitably, need to continue to decrease the number of personal vehicles on that road. We may, in the future, need to get well beyond 30%.</p> <p>DISPERSED USAGE (COMMUNITY). I am concerned about the amount of focus that seems to go to providing transportation to Alta and Snowbird during peak hours only. Of course they are the destination for much of the traffic on high-use / powder days. But most days of the year, and certainly also on powder days, the usage of the canyon is diverse and dispersed. And the usage is increasing, even in the summer. Again looking to the future and the entire Wasatch community, an option that only serves these two ski resorts seems short-sighted.</p> <p>ENVIRONMENTAL IMPACTS (VALUE). During the town hall I attended, Vince stated that "if we were trying to protect the environment, we would not propose any transportation solutions.</p> <p>This concerns me, and I hope that the environmental/impact assessment portion of the EIS will carefully and realistically scrutinize the impact to our canyon of all the alternatives. I am concerned that the desire to get skiers to resorts will override the environmental considerations. Little Cottonwood Canyon is beautiful and unique and one of the reasons we all love living and recreating in Salt Lake City. I believe we should work toward a solution that will change the nature of the canyon as little as possible while still enhancing travel efficiency and safety. I understand any change will have an impact, but we should prioritize minimizing this impact - especially where we are uncertain if a solution will be the long-term fix we really need. We have not fully tested making the bus the preferred option through behavioral and economic incentives. Again, in the future we may need to potentially keep the majority of personal vehicles off of the roadway to make way for an efficient bus system. I'm concerned about the visual and experiential impacts of installing supports and stations for a gondola all the way up the canyon. I am also very concerned about these same impacts of widening the road to add additional lane(s). I support trying to find solutions within our existing road infrastructure as a first real step. Let's test enhanced bus service WITHOUT road widening first. I hope the environmental assessment will seriously consider wildlife corridors, watershed issues - specifically with widening the road, and the changes that we choose to make to our canyon. The summary states that "the partners seek to deliver transportation options that meet the needs of the community while preserving the value of the Wasatch Mountains." How is value defined? There should be value assigned to keeping our beautiful canyon a place of wonder, awe, and exploration. Humans clearly crave this - so let's value this aspect. I am also concerned about the construction of snow sheds. What visual impacts will these have? Just like gondolas can occasionally be shut down for wind, road can occasionally be shut down for avalanches. In my opinion we should be willing to accept some natural consequences of traveling in winter conditions and the occasional road closure instead of trying to control all aspects in order to arrive at a resort. In my opinion, the beauty of our canyon is worth more than the occasional road closure. Please also consider this in "your assessment. Finally, I know that it is not part of the scope of this assessment to consider the carrying capacity of the canyon. But this may become a question in the future, and I believe the long term question is not simply, "how many people can we get up the canyon how quickly?"; but also, "how many people can our canyon sustain and what will keep our canyon healthy?" While you may not be answering this question now, I think you should keep it in mind as you review the alternatives. Yes, I would give up the ability to access the canyon on EVERY single day I wanted to if it meant that long-term the canyon remained a healthy and wonderful place for us to enjoy, for us to dream in, for clean water, for wildlife habitat, and for preservation of wild spaces.</p> <p>COMMUNITY CONCERNS. I heard a lot at the town hall that tolls were concerning because they would make skiing an elite and rich activity... as if it isn't already primarily that. As if a gondola would not primarily serve middle-class, white skiers of Alta and Snowbird. I believe there are ways to serve our community and give everyone the opportunity to enjoy the canyon. Integrate bus transportation up the canyon with valley transportation. Give people an opportunity to enjoy other parts of the canyon besides Alta and Snowbird alone by building public transit that will stop along the way for hiking, snowshoeing, climbing, picnicking, and an entire range of activities. Those of us with the means to drive our cars - especially solo - (likely using Solitude's model of a sliding pay scale based on occupancy which, according to the CWC, seemed quite effective and decreases stress on families to drive up the canyon) can pay a toll. Bus could be a reliable and relatively cheap option to get a diverse community to the canyon to use the canyon in diverse ways. Integrating this with public transport in the valley may also provide the opportunity to offer passes that coincide with work commutes, considerations for low-income passes, and many creative and strategic ways to not lock people out of enjoying the canyon. Along these lines, parking for transit should be free. Make this work for our entire community!</p>	Angela Isaacs	Website
5110	I support the Gondola alternative, it offers the most environmentally friendly solution, the most aesthetically pleasing option, and offers the best fit for a mountain town!	Blake Henderson	Website
5111	<p>The Gondola proposal created by UDOT is a terrible solution to the issues facing big and little cottonwood canyons. First of all it will require two transfers, from car to bus to gondola which will be logistically problematic. Second, it puts way too much emphasis on vehicular travel. Encouraging automobile travel is what created this mess. We need to have viable alternatives that do not include requiring people to drive close to the canyons. Any widening of those roads will further diminish these natural treasures. UTA has a robust transit system throughout the valley, run Bus Rapid Transit like vehicles from locations throughout the valley directly to the resorts.</p> <p>This plan spends hundreds of millions of dollars and doesn't do anything to solve issues in big cottonwood canyon. Big cottonwood may not have as much traffic as little cottonwood, but it is not far behind. We need a plan that addresses transportation issues in both canyons. In fact the 6000 car parking garage for the gondola up Little Cottonwood canyon will be placed at the mouth of Big cottonwood canyon several miles away. This will increase traffic at the mouth of big cottonwood by requiring drivers from south of the canyons to drive past little cottonwood park and big and then take a bus back to little to get on the gondola.</p> <p>Finally, the gondola plan endangers important sites for other uses in the canyon. The base of little cottonwood canyon is home to some of the greatest rock climbing in the world. People move from all over the world to live in SLC for that climbing, the base station for the gondola will destroy many of the boulders that climbers use and will possibly hurt access to many of the cliffs.</p> <p>Do not build this Gondola!!!</p>	Chris Jackson-Jordan	Website
5112	I vote for the gondola option, best for the environment. We don't need bigger highways and more cars!	Mac Henderson	Website
5113	Expand lanes on Wasatch Blvd and 210 to the LCC park and ride. Only expand the road further if there would be low environmental impact and not affect any of the summer recreation such as bouldering, the river, or existing trails. Build snowshed where needed in only the most frequent avalanche paths. Do not build a gondola that would really only help ski resorts during peak times of the winter. Increases bus service, make it more like a shuttle system with many access points for other user groups like hiking, backcountry skiing, and climbing.	CURTIS ALLRED	Website
5114	I vote for the gondola option, better for the climate, SLC, the mountains, the resort, residents, employees, and visitors!	Shaye Henderson	Website
5115	Gondola Please. Big cottonwood too. Gondola from Park City side/ Big and Little Cottonwood from the bottom. Thanks	Hans Hjelde	Website
5116	Stop ruining nature! This is a great idea	Bethany Merrill	Website
5117	<p>We have been multiple users of Little Cottonwood Canyon for fifty years. We downhill ski, cross country ski, and hike and climb canyon trails. We treasure the canyon and mountains for their aesthetic and environmental values as well as the Salt Lake Valley's critical watershed. We are patrons of the resorts.</p> <p>The gondola alternative will not serve our transportation needs and be a blight upon the aesthetic values of the canyon.</p> <p>A bus system coupled with limits to and regulation of automobile access is the most straight forward means for meeting current transportation problems. As little construction and habitat damage should be the primary standard of judgment for any construction required.</p> <p>It is obvious that it may (will) eventually become necessary to limit human use of the Wasatch to protect the watershed and environmental values so it is irrational to spend taxpayer dollars on infrastructure that will be abandoned in the future.</p> <p>It seems as though this EIS has not really considered climbers as a user group. I would like to see some complete proof that would allow for the canyon to see use for climbing during all months of the year. Additionally, boulder destruction should be considered in term of the environmental impact of road widening. This EIS seems to put the interest of resort skiers ahead of all else with the time period where real traffic issues make up 50/365 days of the year, yet this solution has impacts affecting the rest of the seasons as well. Dispersed recreation is a valid form of recreation.</p>	Ann and John O'Connell	Website

5120	I love the gondola ideal	JoCee Porter	Website
5121	My biggest feeling is that roadways shouldn't not be widened! That would negatively impact climbing areas in the canyon. I think we should have a more detailed analysis of enhanced busses and shuttles, but again, NO road widening. I love the idea of having a gondola in little cottonwood canyon because I personally use that canyon extremely often and would be happy to donate money towards the gondola if needs be.	Katherine Allsup	Website
5122	Sincerely Max Jarvie	Max Jarvie	Email
5123	In the gondola draft, the transportation hubs are noted near commercial developments which makes sense due to the density of traffic that will surround these hubs. There are many people who propose this could be a viable solution, however, it has recently made known that a parking garage/ transportation hub has been recommended at the base of the canyon near residential area, which will continue to back up traffic on Wasatch Blvd while people wait to access the garage just as they have waited to access the canyons. And during the off season, this section of Wasatch would become a high speed commuter highway. I understand the resorts are backing this proposal and money talks. How has UDOT considered the thousands of children that cross Wasatch Blvd to access schools, parks, etc., and all of the residents that live in the area? Why was a gondola parking structure in this area never addressed in the virtual meetings and draft alternative plans?	Molly Sparks	Phone Comment
5124	Gondola - seems like the only option that will address the requirements without further road development and the inefficiencies that roads represent and the ongoing avalanche issues. It may even reduce traffic!	Adam Smith	Website
5125	I believe that the gondola is the best option. We can reduce traffic and help get people up the canyon. It will also help with emissions, as it will reduce the amount of cars traveling up the road. This reduced emissions will help with our smog problem and global warming.	Spencer Bringhurst	Website
5126	<p>There are relatively a small number of big snow days each year when the traffic in the canyon backs up. 95% of the time there is little or no delay getting up the canyon, and midweek there are usually minimal parking issues.</p> <p>Gondola (Almost as dumb of an idea as the train) So, you are saying you want me to spend a lot more money to wait a whole lot longer to ride a gondola? There are so many problems with this gondola idea, I'm not sure where to start. But let's start with money...</p> <p>Costs per Rider Any idea of how much it is going to cost to ride the gondola per person? \$10? \$20? Each way? I would love to see your model for how you think this is going to pay for itself. Are your estimated operating and maintenance costs taking into account the losses you will likely incur from low ridership? Are our tax dollars subsidizing this goofy project when you can't get enough people to ride? So, how much would it cost for a family of 4 to take the bus and gondola up and back to Alta for a day? \$80-\$120? Is this a sustainable model if you only end up having heavy traffic on it for 10-20 days per ski season? I highly doubt it.</p> <p>Time to get there (and back) Once I reach the mouth of the canyon, in my car, it takes me an average of 10 minutes to reach Snowbird. Your estimated times to ride the gondola are 5 or 6 times longer than that (even longer for those continuing on to Alta). That makes absolutely no sense to me, especially if I only want to go ski for an hour or two.</p> <p>One of the reasons tourists enjoy coming to Utah to ski (I've talked to many over the years) is because (unlike Colorado), they can get from the airport to a handful of resorts in less than an hour. You are talking about (at least) doubling that time. So, who exactly are you marketing to? Tourists? Locals? Gondola enthusiasts?</p> <p>Wind Delays The Snowbird Tram closes regularly due to high winds in the canyon. What are the wind tolerances for your proposed gondola? So, what happens when winds shut down the gondola and you have busses dropping off hundreds of people at the gondola base station?</p> <p>More Bottle-Neck! Some of the proposed Gondola plans that I have seen include large parking structures at or near the mouth of LCC. So, essentially, you want to take a natural bottle-neck area and put a cork in it! Parking structures will be a nightmare on busy mornings causing even more delays as people try to navigate to a parking space in a multi-story parking structure.</p> <p>Disneylandification of LCC How much are Snowbird and Alta going to chip in to build and maintain this 'Disneyland' Ride up our canyon? Those are really the only two Of course the resorts want the gondola. That is just one more neat attraction that will help differentiate their resorts and attract more people. They don't care if very few people ever use it or that it will never pay for itself. For the resorts, it's just a really cool looking marketing brochure. The problem is that the rest of us, living down in the valley, are paying for their marketing budgets...in perpetuity!</p> <p>Snow Sheds This one is a no-brainer. Yes, we need snow sheds! Most of the closures in the canyon are due to avalanche mitigation and cleanup. The snow sheds could dramatically reduce the amount of time the canyon is closed. These closure delays also tend to coincide with large storms which attract the most number of people to LCC...so it is a win/win. I have seen snow sheds used successfully in Canada (Banff National Park). Build them, already!</p> <p>Extra Lanes and Busses I don't believe we need additional lanes all the way up the canyon. It might be nice, but I understand there are a number of places where it would be difficult or cost prohibitive to add another lane. You could add another lane up most of the canyon, however, which could alleviate a lot of problems, including additional passing lanes.</p> <p>The first up-hill passing lane in LCC is over 4 miles up the canyon. On heavy snow days (and heavy ski days) traffic flow up the canyon is reduced by the 'weakest link'. The weakest link includes non-4WD vehicles that struggle on wet, slippery roads, large/slow trucks, inexperienced winter drivers, cars with poor tire tread, etc. Only one of these weakest link scenarios can back up the entire canyon. Having more up-hill passing lanes will enable slower traffic to move over and allow other vehicles to pass and keep traffic flowing.</p> <p>Busses are also the most scalable option. Schedules can be adjusted (or eliminated) depending on demand. Building, running and maintaining a gondola has high sunk and fixed costs. The ability to adjust schedules and expenses to meet demand is just not possible.</p> <p>Other options to consider: How about building a bus Park & Ride near 9400 S 2100E in the old ShopKo parking lot? How about access to the LCC ski resorts via American Fork Canyon? Why does everything have to go up LCC? Put a gondola up in AFC and get Utah County residents to pay for it. A lot of the traffic up LCC is originating from Utah County. Why are we trying to cram more and more people into LCC? How about building other ski resorts across the Wasatch Front? Why are we never asking the question about the capacity of Alta and Snowbird? There are only so many people that can safely be on the mountain. Figure out how many people you can have on the mountain and then come up with a parking and public transportation plan to match that capacity.</p> <p>Anecdotally, I have noticed a significant increase in traffic and skiers since the resorts implemented the IKON pass. Maybe we should be looking at how resorts are marketing their products and if they are negatively affecting our traffic flows.</p>	Rich Winwood	Website
5127	I am for the 1st option, and if necessary the 2nd. I feel more passengers will take the bus if there is a more effective system. I feel that the least natural damage is the best. The gondola would take a long time, and wouldn't always be able to run on particularly stormy days. Buses can almost always run, unless the road isn't closed. If there is an efficient bus system, and adequate parking at the bottom of the canyon, people will utilize this resource.	Tsiyva Devereaux	Website
5128	I think Enhanced Bus no additional road widening is the way to go. I believe this is the best way to maintain the integrity and beauty of the canyon. Utah should not take for granted it's increasingly limited natural wilderness areas and do everything possible to preserve them. Limiting vehicle traffic it the best way to achieve this goal. We must put nature first before it is too late.	Sharlene Tharp	Website
5129	I'm very concerned about the proposed expansion of Wasatch Blvd. and how it affects my property value, quality of life, etc. I can see benefits of bus lanes and pushing people to use public transportation if they want to go skiing. For some of us that live very close to Wasatch Blvd. are there any plans for sound mitigation? If something is absolutely required, it appears to me that the imbalanced lane alternative for Wasatch would make more sense. I've never seen traffic back up on Wasatch from people leaving the canyons. It only backs up when people are heading southbound on a heavy powder day.	Cameron Simonsen	Website
5130	I'm involved in development and understand evolving requirements, but doing anything you can to keep Wasatch more of a neighborhood thoroughfare rather a busy highway would be greatly appreciated. Thank you. To promote safety and still provide responsible year long access to LCC for all people, the Enhanced Bus Service with no road widening will have the least impact on the canyon, and still allow people responsible recreational access.	Paden Allsup	Website
5131	The gondola PLUS La Caille Base Station sounds like a great way to address the multiple issues that surround the transportation issues in Little Cottonwood Canyon. I support this concept and recommend additional study and discussions occur.	Scott Van Wagoner	Website
5132	My personal preference for UDOT's proposed options is the dedicated lane for enhanced shuttle bus system with the improvements on Wasatch Blvd and the 9400 south/Wasatch Blvd intersection. Mobility hubs with larger park and ride lots will benefit also. I feel all 3 canyons, Millcreek, Big and Little Cottonwood need to have shoulder improvements. I was recently noticed shoulder improvements in American Fork Canyon a couple weeks ago. That canyon has come along ways especially Timp Cave and visitor center. Keep going UDOT! Thanks for all the improvements :)	Susan Logan	Website
5133	Either the Imbalanced-lane or Five-lane Alternatives are unacceptable because they encourage high-speed travel through a residential area which includes eleven residential intersecting streets. 12-foot wide lanes and straightening of roadway will create higher speeds, and more air/light/water/noise pollution. People who live in the area will be subject to higher danger just trying to get around the Cottonwood Heights community. The other issue is that you can only widen the road up Little Cottonwood Canyon so much because of its geography - the backups will still happen and will now have multiple lanes of cars 'stuck', all polluting the neighborhood during the backup periods. A desirable roadway through residential strip includes no more than one lane in each direction with one REVERSE LANE for BUS TRANSIT/HOV ONLY. The area is essentially landlocked so significant increases in residential traffic are unlikely. Current and foreseeable future vehicular use simply does not warrant a massive roadway expansion. This is a beautiful part of the valley and ruining it with a road expansion just to accommodate two ski resorts is extremely short-sighted. There are other options to expeditiously move people up the canyons that will not permanently destroy a thriving neighborhood.	Jenifer Lloyd	Website

5134	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p>	Jake Krong	Email

5136	<p>I vote for the enhanced bus system with no road widening. We need as little environmental impact as possible and this is the solution. The new busses also need to be electric</p>	Teddy Charlton	Website
5137	<p>I strongly support the enhanced bus only option. I fear that roadway widening and gondola solutions are only solutions for the small amount of days that traffic is actually a problem, and they will have high costs the other days of the year (especially during the summer). Both (especially the gondola) will negatively effect the splendor of the canyon, and the roadway widening will really hurt climbing recreation in the lower canyon. Additionally, neither of these plans seem to take into account the needs of dispersed users (backcountry skiers, climbers, hikers, etc..) and will have a hard time balancing their needs with reducing traffic.</p>	GARRETT HARMSEN	Website
5138	<p>I am in support of the Gondola Plus the La Caille Base Station. This is the best option for our community and our environment.</p>	Isabel Demschar	Website
5139	<p>Enhanced bus alternate is the only realistic option. A limited transport gondola has extremely limited improvement on transport at the highest possible cost—this is a ridiculous option. Snow sheds make sense in certain locations, moving more and more cars is not helpful, we should focus on moving more people more efficiently. This is why more bus support is better. Also the resorts should not be given special or greater priority because of there lobbying power. The local people should have the biggest impact on UDOT's choices. Don't destroy our small beautiful places for money and power. You are killing the goose that lays the golden egg.</p>	Kelly Paasch	Website
5140	<p>Dear Utah Department of Transportation,</p> <p>I am a SLC resident who loves traveling up the Little Cottonwood Canyon (LCC) for skiing, hiking snowshoeing, etc. all year round. I often do not have access to a vehicle, I care about the health of the canyon and the local environment, and have a small student budget. Thus, I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Sincerely, Ms. Ashlea Patterson</p>	Ashlea Patterson	Email

5142	<p>I believe the gondola option offers the most attractive, safest, cost-effective method of relieving Little Cottonwood Canyon congestion.</p>	Clive Romney	Website
5143	<p>Of the options, I support the first bus option, which includes no additional roadway. Little Cottonwood Canyon is a precious resource, and any expansion of roadway or traffic should be made based on scientific data on the human carrying capacity of the canyon, which we do not yet have. Until that data states otherwise, I do not support intrusive measures, such as the expanded roadway or gondola options, especially if those options exclusively service those going to resorts. These measures are visually and physically intrusive and would significantly decrease the experience of traveling through the canyon.</p>	Carly Huchendorf	Website
5144	<p>Much better than a bus!</p>	Ryan Schmidt	Website
5145	<p>I support the Gondola.</p>	Eddie Canaday	Website

5146	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier, mountain biker, hiker, backpacker, rock climber, and hunter. I go up Little Cottonwood Canyon frequently thru out the year, during all different seasons and times.</p> <p>I love the feeling of wild and solitude that can be found so close to Salt Lake City. It's an incredible area that I believe should stay wild. For that reason I am in favor of Enhanced Buses without widening lanes.</p> <p>My ideal solution would be something similar to Zion National Park. During the Winter Ski season I believe that busses should be inexpensive, frequent, and convenient. Busses could even be the ONLY form of transportation during that time, provided that they make stops in all recreation areas. During the spring (after ski season), summer, and fall I believe busses should still run, but there should be no restrictions on taking vehicles up the canyon. I believe the enhanced bus system most closely resembles this.</p> <p>I believe that keeping Little Cottonwood as wild as possible without the use of tunnels or gondolas the area will stay true to itself. It will provide a beautiful, wild experience for many who would otherwise need to drive hours. I believe this is the best option for the environment, the community, and future users.</p>	Luke Richins	Email
5147	<p>After reviewing the various options for enhanced LCC transportation, I am very much in favor of the gondola option. This is mainly due to the poor air quality issues that the SLC valley experiences due to the heavy vehicular traffic in the valley and also going up LCC which will certainly be worsened by any additional vehicular and bus traffic going up the canyon. In view of my air quality concerns, my second favorite option would be the enhanced bus option with no additional roadway capacity. In any case, I believe that a reduction in personal vehicles going up LCC would be helpful for both the air quality reasons I mentioned previously but also for an improvement to the aesthetics of LCC by reducing the number of vehicles moving up and down the canyon and the required parking facilities required for the same.</p>	Michael Polacek	Website
5148	<p>Can we please consider the gondola from LaCaille? That seems like the best solution to me. It has a vastly larger volume of people it would serve, a lower price tag for creation, and would facilitate a new base station with plenty of parking, commercial businesses like bars and restaurants, and would provide an easier way to get up and down an already crowded canyon. Most importantly, a gondola would solve one of the largest problems - all the road-based solutions will not work in heavy snows, when avalanche gates are closed, or when bad drivers wreck and block the road. The gondola would have lower CO2 emissions, would provide a great viewing experience for tourists, and is the same solution countless European cities use to get people to their ski resorts. Widening the road makes zero sense. There are already capacity and parking problems in the canyon, which this would only exacerbate. Not to mention, with more cars coming down the road, eventually the lanes will have to merge and will continue to create congestion. Either widening the road or using more buses, or a combination of both does NOT solve the core problem of snow, avalanche closures, and bad winter driving behavior, and is crazy expensive. Arguably it will make congestion worse. The ONLY solution that avoids all of the snow related problems is a gondola. Local neighbors around La Caille already have ridiculous levels of traffic on busy ski days, so I wouldn't expect a huge adverse change there. In fact, I would expect local property values to rise because of easy access to the Gondola. Please consider this option! The gondola towers are barely taller than the surrounding trees and the change in the watershed would be minimal. (It's hard to take complaints seriously about view and natural surrounding being interrupted by gondola towers when you currently have idling traffic jams, helicopters flying around, and other man-made traffic of all sorts.) The bottom of this canyon is not wilderness. I am a property owner in Alta and would happily take a gondola for 27 minutes rather than drive a dangerous and congested road. No more road expansion! It's Gondola time. Europe long ago found this solution to be the best combination of least invasive, truly problem solving for road issues, reasonably priced, and respectful of surrounding property.</p>	Matthew Hoffman	Website
5149	<p>The plans are skewed to accommodate skiing and the ski resorts but not other activities in the canyon such as rock climbing, ice climbing, snow shoeing, and hiking. These other activities need to be included in the overall plan. These other activities are done by local Utah's. Where as a good proportion of skiers are from out of state. This is another case of social injustice were the State Government is catering to out of state money rather than to the interests of bettering the life of local Utah's. I also want to state that I support the Salt Lake Climbers Alliance and the American Alpine Club comments made.</p>	Frank Nederhand	Website

5156	<p>From every standpoint - efficiency; environment; aesthetics; consumer/skier freindly; costs, etc. - it makes the most sense to deal with the traffice challenges in Little Cottonwood canyon by building a hign speed high capacity Gondola - anchored by a modern and efficient base facility in the Salt Lake Valley.</p>	Bernard Weichsel	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5157	<p>The gondola option is preferred but not in its current proposed form. There are a few major red flags that needs to be addressed before approval or implementation. I will not be addressing the bus options as those are highly unfavorable for many reasons; increased bus traffic, bigger footprint in canyon, etc.</p> <p>Assumption for all problems listed below are based on today's traffic which is only going to be exponentially worse in 2050 which is the assumption for the figures listed in the slides.</p> <p>Problems: 1. Gondola is only accessible by bus via Mobility Hub.</p> <p>A: This creates a huge traffic jam all around the Mobility Hub. All major and side roads will be heavily congested with vehicles trying to access this location. Wasatch is a mess on a ski day already, now the proposed suggestion moves all traffic to one area. This option is similar to if the airport only let UTA bus traffic in the airport terminals. Now all traffic has to merge.</p> <p>B: Vehicles with the destination of the Mobility Hub must now bypass the Lower Cottonwood Canyon (LCC), (if headed Northbound Highland/Wasatch etc.) and add to the Big Cottonwood Canyon Traffic (BCC) in order to reach the Mobility Hub. Once they reach the Mobility Hub they get on a bus only to be in traffic headed southbound towards LCC, essentially doubling the amount of traffic on the road, doubling congestion and time and impeding access to BCC.</p> <p>2. Gondola does not improve closure times due to avalanche.</p> <p>A: If the canyon is closed due to avalanche pre-resort opening, now all vehicles must drive to the Mobility Hub, take a bus, Get on Gondola (see problem 1A,1B). This includes employees of the resorts and support staff.</p> <p>1. Do employees and support staff get priority boarding on Gondola? 2. How much seating can you accommodate at the Mobility Hub when it's a powder day and the Gondola is the only route up the canyon due to avalanche closure? 3. The Gondola is a slow option, on a ski day with an avalanche closing the canyon, people will be waiting hours to not only find parking at the Mobility Hub, but for the bus and to get on the Gondola and up the Canyon.</p> <p>There will be thousands of people trying to queue. Also have you ever been in a long line on a powder day? Unfriendly and anxious would be two words to describe it.</p> <p>B: The Gondola alone is not a sufficient means of transportation for the quantity of people that will use the canyon if an avalanche closes the canyon.</p> <p>1. If there are freezing temperatures, high wind, and heavy snow, will the Gondola continue to operate? 2. How will thousands of people leave the resorts if that occurs? 3. Can the resorts accommodate that many stranded people while inter-lodge is in effect? 4. In reference to the meeting, it was mentioned that this was out of scope, but this should be a part of the scope. What is the backup plan if the resorts can't accommodate all the thousands of people now stranded due to Gondola and road closure?</p> <p>3: Gondola does not include Snow Sheds</p> <p>A: See problems 1A, 1B, 2A, 2B.</p> <p>B: It was mentioned in the meeting that the cost for the Gondola and Snow Sheds is too cost prohibitive. Do not implement a solution that does not address all the problems because cost is an issue. Do the project right, one time. See I-15 in Lehi as an example. How many years has that area been under construction due to new construction to alleviate traffic jams? Or Bangerter Highway. That highway has been torn apart and public domain has been implemented just to widen it. Build it right, the first and only time.</p> <p>Opinion: If cost is too high, then wait and procure the budget. Don't implement half a solution which moves the traffic problem somewhere else.</p> <p>Recommendations: Snow sheds Gondola parking and drop-off Single Occupant Vehicle Restrictions: Do not restrict Single Occupant Vehicles. This excludes a large number of outdoors enthusiasts who do not have someone to accompany them. Everyone should be able to enjoy the canyon without being forced to ride a bus or a shared ride. Encourage shared rides, encourage bus use. Do not restrict single occupant vehicles.</p> <p>If a toll is necessary for single occupant vehicles, then treat it like the HOV lanes on the freeway with the Express pass. DO NOT RESTRICT SINGLE OCCUPANT VEHICLES.</p>	Chase Nelson	Website

5159	Maybe consider installing a Gondola with numerous stop off stations along the way, like often done in Switzerland (Zermatt, Verbier, to name just a couple). Road can be reserved for Residents and employees only. Think about it, not a bad idea!	James Garrett	Website
5160	Hello I am in full support of the LCC Gondola and La Quai base station. This proposal is sound in so many ways. Please let's get this passed and get lots of cars out of the canyon!!! Thank you	Stephanee Grosscup	Website
5161	I strongly support the La Caille Base Station Gondola option. Folks will be resistant to using a bus plus then transferring to a gondola. Commute times are not great. Ample parking at the base of the Gondola is clearly the way to go. It will make total travel time more palatable to regular tourists like myself and locals alike. It is worth the extra investment and is clearly the best option as it not only creates a shorter commute but also will allow the resorts to stay open when it is heavily snowing which is quite frequently. Additionally this will reduce carbon emissions from the "red snake". I learned that phrase after getting home to my Airbnb at 9:30 one evening.	Bryce Wallace	Website
5162	Thanks! Bryce		
5162	I'm in favor of the two road options and against the gondola. I think, unless there are strong incentives that encourage people to take the gondola, it will be underused and therefore a waste of money. In addition, although hopefully this pandemic will have subsided by the time the gondola is built, we are now in a pandemic age. If another pandemic occurs, social distancing will be impossible in the gondolas and the capacity will be so significantly reduced that it will not be a viable transportation option. This is not a transportation option that allows for flexibility for future issues that may arise.	Becky Selikoff	Website
5163	This is such a great idea. Choose the Gondola with the LaCaille base option. Please!	Jean John	Email
5164	I commuted up the canyon for 35 years. I was snowed in on many times, sliding off the road multiple occasions, and I rolled my truck once. I was unable to take the bus because of my odd hours of work. Having a gondola would be so much safer and enjoyable to get to the greatest snow on earth. Thank you	Lawrence Fort	Website
5165	Please do not widen roads! We love our beautiful canyon for hiking, biking, climbing, and much more. The community wants the gondola!	Chelsea Buckley	Website
5166	The gondola option looks best with its minimal pollution impact in the Salt Lake valley.	Andrew Spry	Website
5167	PLEASE DO NOT build the gondola!!! The further destruction of the nature in the canyon that not only the gondola but the construction process would take is horrific. The gondola would also open up the canyon to SO much more unneeded tourist traffic which also causes the destruction of the nature. This would cost locals so much money. There is also no room for any more parking at the base of the canyon which would be needed and would also cause much more destruction of the surrounding community. This is unnecessary and invasive to the community.	Katie Farrell	Website
5168	Gondola	Matt Miller	Website

5169	<p>The "enhanced bus" option seems like it will not affect the traffic volume in any substantive way. You'll add more buses to the road, but individuals will not be incentivised to actually take the buses any more than at present.</p> <p>The "Enhanced bus with road widening" option "does" incentivize people to use the bus due to the dedicated bus lane—it translates into potential quicker commute times to the resorts. One worry is that cyclist also use the LCC bike shoulder in the winter and spring. It would be good if this option included information about whether the cyclists would be banned from LCC during ski season, when the bike lane would be open, etc.</p> <p>How long is a gondola trip? 63 minutes is much longer than the other two options, thus dis-incentivizing gondola use. More info needed on how that travel time is broken down.</p> <p>Dear Utah Department of Transportation,</p>	Landon McBrayer	Website
5170	<p>I am a backcountry skier and hiker who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation throughout all seasons of the year. I appreciate this opportunity to comment on the LCC Environmental Impact Statement as I am a resident of Cottonwood Heights living between the canyons and already feeling the impacts of the Wasatch Blvd construction and traffic. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a winter and summer user of our canyons I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Sincerely, Mr. Ken Kiss</p>	Ken Kiss	Email
5171	<p>As an avid skier and hiker and growing up in SLC I've experienced the traffic challenges in LCC which have greatly increased over the years. I also deeply care about the environmental health of the canyon and care about the natural beauty (why we all come to this canyon).</p> <p>Reviewing the options I do not support the widening of the road with Peak Period Shoulder Lanes in any scenario as it allows for more travelers vs reducing overall impact. Would widening the road have greater impact on the watershed? It's unclear how construction and long-term widening would affect the stream ecosystem running down the canyon.</p> <p>Considering the other alternatives I would suggest doing a hybrid of both the enhanced buses AND the gondola options in order to greatly reduce cars on the canyon road in our future. The gondola would help resort users and buses would support alternative uses like backcountry skiers (including myself)/summer hiking/resort employees during off gondola hours.</p> <p>The enhanced buses appears to be the fastest option to implement first while we wait for the gondola construction. Buses can be used in the immediate interim until the gondola is built. Once the gondola is complete the bus volume can be re-evaluated to enhance the combination gondola plus buses to further improve the traffic challenges. Buses allow for most flexibility during high and low demand times.</p> <p>I'd also like to see that buses be fully electric to further reduce impact on the canyon and our air quality. Has there been a financial analysis on electric buses? And any pollution reduction study if buses were fully electric? Will UTA invest in electric buses?</p> <p>I also have concerns and questions about the gondola option. I worry the three-step process for getting up the canyon using the gondola will be too challenging, particularly for families with children. I'd highly suggest adding a parking structure at the base gondola station rather than requiring all gondola users to park at the gravel pit lot and bus to the gondola station. Parking needs to be easy to encourage adoption of the gondola. It is unclear if there will be a fee for riding the gondola? Will ski passes make it free? Pricing and convenience need to incentivize families in order to increase gondola use. I'd also re-review adding a drop off option at the gondola base to help with reducing cars requiring parking. Regarding scheduling when will the gondola will operate? Will it run at early/late hours to accommodate backcountry enthusiasts, resort employees, and contractors traveling up the canyon at all hours? Beyond the resorts the majority of land is 'public land' people recreate in. Would the resorts cover more operational costs of the gondola considering its a solution that delivers people to those locations? I personally ski at both Alta and Snowbird so support the drop off locations but also backcountry ski and hike (starting at trailheads below the resorts) so looking for the gondola to be a solution for a broader part of the community who uses the canyon (not just resort skiers).</p> <p>Finally, I worry about the fact Big Cottonwood Canyon was not included in this study as traffic in one canyon impacts traffic in the other and its all part of the same wildlife ecosystem and watershed area.</p> <p>Dear Utah Department of Transportation,</p>	Heather Matheson	Website
5172	<p>I am a backcountry skier and hiker who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation throughout the year. I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a Cottonwood Heights resident living between Big and Little Cottonwood Canyons and a local year round user of this amazing resource I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Sincerely, Mrs. Julie Daily</p>	Julie Daily	Email
5173	I support the enhanced bus system with no road widening, as I believe it is the best and most reasonable choice, and won't affect other activities in the canyon.	Ian McClane	Website
5174	Widening the road seems like a bad idea ,please consider gondola is a better option for nature and the beautiful Canyon	Greg Nay	Email

5176	<p>As a resident of Cottonwood Heights living in the Top of the World neighborhood, I'm extremely concerned with the proposals for Wasatch Boulevard. I am begging UDOT to reduce the speed limits on Wasatch for the safety of residents pedestrians, bicyclists as well as creating safe entry/ exit points for the neighborhoods. Each day it is a gamble entering and exiting to/from Wasatch and I fear the day that we are not so lucky. As a parent, my fears are further increased that one of these drivers coming at 50+ miles per hour will T-bone my car and the likelihood of my family coming out "okay" from the wreckage will be slim. Furthermore, the high speed increases road noise. It seems ridiculous that a couple of blocks down on Wasatch they have visual speed reduction measures (which also help reduce pollution by way of more plants and trees) as well as, if I remember correctly, a 35 MPH speed limit. Foothill Boulevard, another major thoroughfare, has a speed limit of 40 MPH. There is absolutely no reason for 50+ MPH speeds in a residential area and I hope that you will protect the public by reducing speed limits for the safety of all.</p> <p>It is also my sincere hope that you will limit the number of lanes installed on Wasatch to a maximum of three total (1 bus only, transitional lane) as we residents of Top of the World and surrounding neighborhoods have no desire to have an East side freeway in our yards, diminishing the peace of the areas that we worked so hard to invest in and move in to. Nor will increased lanes on this stretch of road reduce the traffic as every direction to which they lead end up as two lane roads, so ultimately, it will just create further bottle-necking and reduced ability of residents to enter/ exit their neighborhoods during high traffic periods. It will also increase pollution to the East bench as more cars are stuck idling on Wasatch Boulevard. This is NOT what we residents/ tax payers want for this beautiful area we call home. PLEASE respect and consider our desires, opinions and concerns and SAVE our land and keep the East bench beautiful for residents and tourists alike!</p> <p>Thank you</p>	Laurel Samuels	Website
5177	<p>I've been skiing LCC for 36 years and used to love it. The traffic and congestion is now so bad, we don't even consider a weekend--much less one w/pow. It's truly sad how poorly managed the situation has become and all of the proposals WILL NOT rectify the issue except for Gondola. It's a no brainer and will bring in much more revenue than it will cost. Right now, people can't even get to the resort half the time to spend their money. Please get it done!</p>	Patrick Duke	Website
5178	<p>It makes the most sense to introduce solutions incrementally, in the most cost effective way, with the least environmental impact. To me this means adding bus service, with improved parking at sites other than right at the canyon base (i.e.: 6200, 9400 and Highland, etc.), and additional buses, including express service to Alta. Adding a toll to go up LCC road, which could probably be done electronically, without requiring a stop, and possibly the ability to screen for the number of people in each car, with discounts for carpooling would also help. Let folks pay for what they get. If we start with those steps, then see if additional lanes are even needed. If enough people use the bus, overall traffic should be lessened. Building a gondola is insane. Despite cost estimate, there are likely to be cost overruns, people still need to take a bus to the gondola, and if you're going to improve bus service, why not just run the buses up the mountain. Thanks for keeping this plan sane.</p>	Phyllis Mandel	Website

5180	<p>I listened to the recording of one of the June 2020 town hall meetings and browsed the options on this website, so my comments are in relation to what I've learned through those avenues. As a longtime resident of Cottonwood Heights, living in a neighborhood off Wasatch, I have a number of interests and concerns related to this project. I will try to group my various comments in related categories since there are many issues being considered for this project.</p> <p>First, I'd like to comment on the portion of the project that relates to Wasatch Boulevard. My family commonly uses Wasatch to get to the freeway or to head towards Sandy/Draper. Over the past 15 or so years we have seen multiple "fixes" implemented on Wasatch. The ones that come to mind were near Fort Union and also the new T-intersection. While we all acknowledge that there is a traffic problem, our perception has been that past fixes lead to a lot of hassle and increased problems during a long construction period, with not much noticeable positive impact after the fact. I would want to make sure that any proposed future projects on Wasatch actually do address the problem and don't cause an overabundance of trouble in the meantime. Some other points related to Wasatch improvement are that I'd like to see bike safety prioritized (make sure there is an adequate lane for this purpose) and I'd also be concerned about being able to turn out of our neighborhood onto Wasatch if there were to be more lanes. We already have a lot of trouble making a left and I feel like with more lanes of traffic this would be nearly impossible. Would more traffic lights be involved?</p> <p>I like the idea of the gravel pit being repurposed for parking. I think that will be a good use of that space and can be served well as a hub area. I'm assuming buses for Big Cottonwood will also serve that lot?</p> <p>The overflow from trailhead parking is obviously ridiculous currently. I'm concerned that (depending on how large the improvements are and how they are used) completely barring roadside parking would restrict people from trails. Also, neither buses nor gondolas will be stopping at trailheads so personal vehicles will still need to have access if they are using the canyon for other purposes. While I highly endorse carpooling, restricting single occupant vehicles will not allow for solo hikers that live in the community.</p> <p>I would like to see more encouragement for people to use the buses and to make it convenient for them as well. Overall my major concerns are environmental impact, sustainability of the chosen alternative, and how it affects the users. I haven't seen much information on how each alternative affects the wildlife or the land itself and would have liked to have that in order to have an informed opinion on the options. I'm worried that the gondola option seems attractive to people as something fun and a touristic novelty, but I don't think that that should be a major focus. I'm worried that a gondola will mar the natural environments of our canyons and we will be forced to view more manmade structures encroaching on our open spaces. The gondola option also would not address other issues related to the road. I'm intrigued by the widening of the road option as it would address multiple issues - traffic flow, increased bus service, and allow a safer option for bikers/pedestrians in the summer (the current shoulders make me nervous).</p>	Alyssa Meredith	Website
5181	I have been a backcountry skier for 25 years and I have seen a huge jump in utilization. Eliminating the roadside parking will not accommodate the new volumes	Keith Roberts	Website
5182	Gondola options should be studied for transportation in Little Cottonwood Canyon.	Sarah Alley	Website
5183	The gondola is much better option - less cars in the canyon.	Ivan Divliansky	Website
5184	Please look into limiting the number of cars. I think a train/tram is the best option. It could follow the road and pick up from the old shopko parking lot	ERICA LENGVASKY	Website
5185	I think the gondola would be the best resolution	Ian May	Website
5186	Get the cars off the road! Gondola great idea.	jo signor	Website
5187	Third lane that flexes both ways with traffic	Ashley O'Brien	Website
5188	Please do this for our air!	Lisa Signor	Website
5189	I would like to support the gondola	Sviatlana Lukashenia	Website
5190	Please use a gondola and or Tram only option for day pass skiers and a Pass for residents/people staying at the resorts can still drive. It will help cut the traffic at least in half. But I urge that spring, summer, and fall the roads are open to all. But honestly it would need to be free or Really cheap because skiing is already so expensive.	Elen McCluskey	Website
5191	ENHANCED BUS WITH ROADWAY WIDENING FOR PEAK PERIOD (SHOULDER LA	susan Johnsen	Website
5192	<p>In the presentation information one of the main goals is to reduce traffic in the canyons. All 3 options presented will NOT reduce traffic in the canyon. The only way to reduce traffic in the canyons is start by restricting cars and force people to use the buses. Here are a couple ideas</p> <ol style="list-style-type: none"> 1. Monitor the entrances to the canyons and not allow cars that don't have the correct tires or 4 wheel drive. 2. Create an app that indicates what is allowed up the canyon. So on a weekday with very little traffic expected all cars would be allowed up the canyon. Busy weekends / holidays require all cars to have a min of 3 occupants. Huge powder days only allow cars with 4 or more people. Also start requiring ski resorts to charge for parking. This will force people to use buses. 3. do not allow street side parking near the resorts. This has to be studied closely with backcountry skiing trail heads and where they can park. top of SR210 and solitude are very popular TH. Buses would not be able to service backcountry skiing because of the early hours they go up and the many TH locations. <p>Widening of Wasatch Blvd will not help with traffic, all it will do it create a 5 lane parking lot when the traffic is busy. You need to keep traffic away from the mouth of the canyons. So providing the mobility hubs at the gravel pit and 9400 south so they could access the buses would significantly pull traffic from wasatch blvd. Outside the bus 15 days a year for skiing wasatch blvd is not that congested. I would lower the speed limit to 40 mph to allow cars entering at the intersections.</p> <p>The Gondola is an idea that will only look good on a brochure. Skiers would not want to take 3 transfers and take 65 min. to get to the resorts especially if they have 3 or 4 kids in tow. On a busy powder day the parking will fill up super early in the day then the rest of the traffic will be on the road again. The gondola might reduce 20% of canyon traffic on a busy day, but that would only be 10-15 days a year. The rest of the days the gondola would see little use. In doing some research it is very interesting how the gondola idea is being pushed by some developers who happen to own adjacent property to the gondola. These developers also have been former politicians. Looks like another case of developers / politician making money off another taxpayer funded project. And this tax payer funded project happen to be next to property owned by developer / politician.</p> <p>At the end the only solution that will have a noticeable difference in reducing traffic will be to restrict the amount of cars up the canyon and start requiring skiers to ride the bus. Maybe start requiring buses only on powder days.</p>	jason gabler	Website
5193	I would like to give support to the gondola plus La Caille Base Station option studied. Ideally as the best option for future growth of the moving more people to the hills. thank you Rick Sittler	Rick Sittler	Website
5194	I fully support the gondola plan for better access. Gondolas are an emerging technology for mass transit that is perfect for the application.	John Lillquist	Website
5195	I support the UDOT gondola option PLUS the proposed LA CAILLE BASE STATION. We don't need more automobile traffic going up the canyon. We need far less to minimize environmental impact. And the gondola would allow skiers to reach the resorts on days with heavy snowfall.	Rich Zito	Website

5196	<p>To whom it may concern,</p> <p>I strongly support the Enhanced bus with no additional roadway capacity in LCC. This offers the most immediate and frugal solution to the LCC transportation challenge. Importantly, it offers the least disruption to the environment of LCC and the tri canyon base areas. As the expanded LCC bus service develops it can be incorporated into a broader Wasatch front transportation plan. I strongly urge UDOT to use a market incentives such as surge parking pricing to reduce the reliance on personal vehicles in the Cottonwood Canyons and encourage public transportation use.</p> <p>I ask that the LCC transportation issues be considered not in isolation but in combination with the challenges for Big Cottonwood Canyon. The narrow approach taken by UDOT does not serve well the interest of all citizens and visitors.</p> <p>Dugg Hannon</p>	Dugg & Ann Marie Hannon	Email
5197	<p>I for all time emailed this weblog post page to all my friends, for the reason that if like to read it afterward my friends will too.</p> <p>Dear Utah Department of Transportation,</p>	Julian Akehurst	Website

5199	I strongly oppose widening Wasatch Blvd to accommodate the ski industry/tax revenue for the state of Utah. Our neighborhood deserves to be heard and respected. We DO NOT want widening of Wasatch Blvd.	MaryEllen Johnson	Website
5200	I support the gondola/base station option.	Rob Dugan	Website
5201	I support the Gondola Plus option with the LaCaille Base station. It seems like the most forward thinking and makes the most sense for love that we all have for the canyons and the growth we are currently and will continue to experience on the Wasatch Front.	Laura Hadley	Website
5202	July 8, 2020 Thanks for posting the study. The EIS and traffic congestion/mobility problem is complicated as you know. I believe if the intent is to protect the environment, then eliminate all vehicular traffic. If the goal is to eliminate congestion and improve mobility, build snow sheds first, improve bus frequencies and numbers next, and build the gondola at the same time. These three Alternatives are not mutually exclusive. You must think bigger than widening a road to solve congestion. And you should place some of the financial responsibility upon the ski areas and resorts, for they benefit from the customer/skier/boarder being at their respective resorts/hotels. Good luck, think big and think next about revenue sources for these projects.	Paul Runyon	Website
5203	Having lived near this canyon, skiing it for years, and now a regular visitor, I believe the Gondola is the best option here. While it would affect the overall appearance of the canyon, the sheer volume of traffic even in the summer is out of control.	Jeff Schuster	Website

5205	Please build a gondola. Enough of the cars. Utah deserves it.	David Crough	Website
5206	<p>Dear Utah Department of Transportation,</p> <p>Just wanted to let you know I have virtually no hope you individually and collectively will make sound decisions. You've failed miserably this far. Worst of all, you could've done well.</p>	Erik Krause	Email
5207	My preference would be to have the gondola put into place. It seems like the best option for convenience, minimal impact to widening the road, less emissions from buses, it runs more frequently, and it seems to be cost effective.	Emily Jarvie	Website
5208	I am in favor of the gondola station plan due to the least environmental impact and can open faster after avalanche control has been done, before roads can open due to snow removal.	Emily Kemker	Website
5209	As a member of the climbing community, I think the most environmentally sustainable option for transport in LCC would be the Enhanced Bus Alternative. I believe this for two main reasons (the first arguing against the gondola, and the second against the PPSL); a gondola would defeat the purpose of visiting natural and wildlife abundant canyon and would be visually unappealing, and a major widening of the roads to allow for a shoulder lane could cause a long term environmentally harmful impact in LCC. For many of those visiting the Wasatch area, the canyons are the highlight of their trip and provide them with an opportunity to experience the thrill of an outdoor adventure away from the crowds. Additionally, although adding a gondola could reduce carbon emissions and solve the parking problem, it would give the canyon an unappealing look and would require damage to the environment to be built; many Utah residents would agree that this would greatly override the natural breathtaking beauty and wildlife of Little Cottonwood Canyon. Finally, in order to widen roads a considerable amount of wildlife would need to be damaged and would not solve the parking problem; it would only increase the car traffic which would lead to more air pollution long term.	Sofia Del Fiol	Website
5210	The turn out from Prospector to Wasatch is DANGEROUS. Numerous accidents from people turning left onto Wasatch to people N/B That miss the turn in the road. This is very dangerous, they miss the turn and go into the median and hit vehicle parked on Prospector. You need to close that intersection and burn the curve in the road.	Cory Isaac	Website
5211	Hey I love to boulder in little cottonwood canyon and I'm concerned about the boulders with the new options available. I believe that increasing shuttles would be the best option for the environment in little cottonwood canyon	Adam Hansen	Website
5212	I've been a backcountry and resort skier in the cottonwoods for 25 years and totally support the "ENHANCED BUS WITH ROADWAY WIDENING" approach including large parking structures at the base of the Canyons. No gondola please!	john kozlosky	Website
5213	I have a strong preference towards the enhanced bus option. An extra lane would significantly impact parking and climbing areas. A gondola would be a huge impact to the area and its beauty. The gondola would only benefit a single user group (resort skiing). Is there enough extra capacity at resorts to even warrant sending more people up the canyon? Seems to me like the lift lines are already overrun.	Jesse Kenyon	Website
5214	Hello my name is gabe schwartz I live in the salt lake area and little cottonwood is absolutely my favorite place in the valley. I spend most of my time Bouldering in the canyon (bouldering is the act of doing short rock climbs on smaller rocks) And I've been looking at your plans To build a gondola through the canyon. And it appears that you are building it straight through a lot of the main bouldering spots. I would really appreciate not having my favorite thing on the planet destroyed. Thank you so much.	Gabe Schwartz	Website
5215	I support the gondola option.	Steve Bounous	Website
5216	<p>I feel like the gondola would be safest way to get people up the canyon during road closures and widening the road will help with traffic. Widening the road also seems necessary for once it's open so one slow car doesn't back it up.</p> <p>I support the option for the Gondola. However the changes I would like to make are that it has a transportation hub at the base of the canyon where people can park without having to bus transport. I also think that the gondola needs to be set up similar to Telluride and Mountain Village's set up with a minimum of 8 people per car with lots of cars.</p> <p>https://townofmountainvillage.com/explore/getting-around/gondola-chondola/</p>	Matt Chirico	Website
5217	<p>I believe that there also needs to be locker space available for season pass holders at Alta and Snowbird. This will keep congestion down on the gondola and allow season pass holders to more conveniently use the transportation.</p> <p>If this goes into place then I think that the road should be limited to residents, emergency vehicles, bus traffic, and essential employees. Otherwise everyone else should be sent to the gondola. Which must be quick!!!!</p> <p>I also think that serious consideration should be given to who will evacuate the gondola and what kind of effect it will have on the Alta and Snowbird patrols as well as UDOT crews.</p>	Dave Kelly	Website
5218	I think the combination of a Gondola and improved/increased bus transportation is the way to go. Along with not allowing cars up canyon, unless they work, live, or have a reason to have access. The problem is the parking and traffic, a larger road will just allow for even more cars to go up a canyon where they won't have a place to park. Building a beautiful Gondola and improving bus transportation while limited the number of cars up the canyon will significantly help our transportation issue. Gondola is my first choice, improved buses (possibly a strictly cottonwood bus transportation system that goes up both big and little cottonwood canyon & is built more efficiently for snow, is another idea)	Ginny Cunningham	Website
5219	I support the Gondola Plus La Caille Base Station! My husband and I would actually use that if there was parking at the base. If we had to park and take a bus to get on, we would not be as likely to use it. We also wouldn't use the bus, even if there were increased buses. The gondola would be a pleasant ride to enjoy.	Shannon Williamson	Website
5220	I support the enhanced bus schedule for the proposed increase in transportation. That canyon would be drastically affected by a gondola or a third lane	Casey Elliott	Website
5221	Organized carpooling seems to be a good alternative.	Marilynn Madsen	Website

5222	Gondola or road widening initiatives are terribly unsustainable. You have to see that the expansion of development in the canyon will only delay canyon congestion for a few years at best. Worse is the environmental impact. What we need to do is change behavior by incentivizing public transit. Enhanced bus service needs to be the first move.	Brett McWilliams	Website
5223	In the late 1980's the consulting firm WKRP (Webster Mobley Research and Planning was awarded a federal UMTA grant administered by Mountainlands Assn. of Governments of which I was a principal investigator and author. A significant portion of UDOT's ongoing considerations and alternative transportation options were contained in our study. As I have not been subsequently contacted by UDOT I'm unaware of the extent that my work has been considered but am available to augment this assessment.	James Webster	Website
5224	Please widen the road and increase bus services. (Option #2) Dear Utah Department of Transportation,	Troy Dubock	Website
5225	I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Miss Mallory Colby	Mallory Colby	Email
5226	Gondola!!!	Julie Steinmetz	Website
5227	I think there are already too many cars in the canyon. A gondola would be a great way to reduce traffic and would lead to more usage of lodging in and around the city.	Jeremy Bonin	Website
5228	I am wondering if the enhanced bus with road widening option would include a dedicated bus lane down the canyon as well as up. If it doesn't I'm not sure it's worth the extra money and environmental impact. The toll and/or price to park will need to be pretty high for there to be an incentive to take transit. The buses need to run later and allow some overnight parking at the mobility hubs for many employees to be able to use the service. Hopefully there would be some sort of annual pass for those of us that can't ride the bus and drive up alone if not. I think it is short sighted to not be thinking about summer bus service and an incentive to use it like stops at popular trailheads. Summers are very busy and getting busier every year. I think bikes should be allowed on the bus too. I don't think the gondola is the answer. The transfer is impractical and limiting for future summer trailhead stops. It should not be promoted for tourism. Ski resorts need to think about lockers too or many people won't ride the bus.	Sarah McCloskey	Website
5229	A gondola would be dope, but the damage it would do to the canyon would be devastating. I am in support of building upon our bus shuttle system, and expanding the road for that purpose. But above all, add a toll on the road, and make the fee meaningful. Don't put the toll at the mouth of the canyon, but put it up toward the resorts. Waive the fee if you use the bus. Make people actually engage with the bus system	Grant Miller	Website
5230	I support additional busses with or without widening the road. I do not support a gondola in LCC Dear Utah Department of Transportation,	Stephanie Sheedy	Website
5231	I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. 5233	I favor both bus options, with a slight preference for the option that includes widening the roadway. Both options are faster and allow for an easier, more direct trip up and down the canyon. Furthermore, the widened road may provide some advantages during the summer months, which are also seeing increased traffic and limited parking options. Conversely, I strongly oppose the gondola option. A 63-minute trip each way is simply too long. And that 63 minutes does not include any delays or slowing of the lines for weather, which seem likely during the winter or when snow and wind are certain to occur. Nor does the 63 minutes account for time in line waiting for a gondola, which will likely be significant during peak hours. Furthermore, the idea of sitting in a relatively small enclosed space with several strangers for over an hour with no person of authority in the gondola strikes me as problematic on several levels. What is to stop someone from lighting a cigarette or a joint? Who will be there to address a passenger who gets ill or who brings alcohol on the ride and consumes too much. That long of a gondola ride is fraught with problems. If Snowbird is so opposed to the bus options, maybe the real answer is for them to place a limit on daily ticket sales like resorts in other states have begun to do when traffic exceeds road capacity.	Jordan Miller	Website

5234	<p>July 8, 2020</p> <p>Utah Department of Transportation Little Cottonwood Canyon Draft Transportation Alternatives Environmental Impact Statement, June 2020</p> <p>This letter is in response for comments regarding the Draft Transportation Alternatives Environmental Impact Statement for Little Cottonwood Canyon road. I am Dave Andrenyak I am a resident of Salt Lake City, Utah for over 30 years. I have been an active hiker, nordic skier, snowshoer, and volunteer in the Central Wasatch Mountains. I recognize the increased number of recreation visitors to the Central Wasatch and the need to reduce traffic congestion at corridors such as the Little Cottonwood Canyon (LCC) Road. I appreciate that the three proposed draft alternatives all involve use of mass transportation. I favor the Enhances Bus – No Additional Roadway Capacity alternative. This alternative will probably have less environmental impact compared to the other alternatives. Also the capital cost estimate for the Enhanced Bus – No Additional Roadway Capacity alternative is lower compared to the other two alternatives. I am concerned that the Enhanced Bus –With Roadway widening alternative could have harmful environmental impacts because of the extensive construction activity need to widen the Little Cottonwood Canyon road. I have similar concerns with the gondola alternative. It is important that the watershed quality of Little Cottonwood Canyon be protected since water from Little Cottonwood is an important source of culinary water for the Salt Lake Valley. Construction projects can cause soil erosion. Hopefully, the next phase of the planning process will accurately evaluate the environmental impact of all three alternatives. It is good that all three alternatives recognize the need for a large transit hubs in the Salt Lake Valley.</p> <p>It is disappointing all three alternatives appear to show bus or gondola stops only at Snowbird and Alta. Any Little Cottonwood Canyon transit improvement project should include stops at popular trailheads such as White Pine/Red Pine, and Lisa Falls. The strong popularity of hiking, snowshoeing and backcountry skiing support the need for transit stops at the trailheads. I understand that it would be logistically difficult and very costly to construct gondola stops at the trailheads. That is another reason to support the bus transit alternatives. In addition, it is important that improved transit projects operate all year round and not only in the winter. I also think that the transits improvement programs should include regulations that will restrict or at least deter private motor vehicle travel in Little Cottonwood Canyon for recreational purposes.</p> <p>Thank you for your efforts to improve transportation in Little Cottonwood Canyon. Thank you for considering these comments.</p> <p>Respectfully</p> <p>David M. Andrenyak</p>	David Andrenyak	Website/Email
5235	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. 5236	<p>The proposed gondola idea will be detrimental to the scenery and recreation in the canyon. If the state opted to put the enormous amount of money a gondola would cost to additional lane space and busing, they would have a much larger effect of getting consumer's to the ski resorts. ALSO, the gondola would only allow for people to get to one end or the other of the canyon. What about all the Trailheads, recreation and climbing areas in between. This would have no benefit to those users. I'm all for fixing the congestion issue, as I ski dozens of times per year in the canyon... BUT PLEASE DO NOT BUILD A GONDOLA! Ineffective, costly and damaging to our incredible views and resources.</p>	Mike Hale	Website
5237	<p>I am against the gondola at this point in time.</p> <p>It may be the correct decision but we have to try other smaller projects before we gut the canyon. More buses!!!!!! Even an uphill / downhill traffic time to reduce congestion. Toll the canyon, I am a pass holder and would rather pay to enter the canyon then jump into a gondola right off the bat.</p> <p>A system that would have a persons car inspected for the canyon on 4x4 days that had something to signify it had been inspected and passed to enter the canyon on these days. Maybe a unique light that canyon goers can put on their windshield provided by UDOT while cops are thoroughly checking tires they can see who has an already inspected and can easily pass into the canyon. All it takes is one car to get into the canyon that shouldn't be on those weather days to screw the entire canyon up. Make it hard to get those passes. Keep up the good working inspecting tires and cars getting into the canyon!</p> <p>I think there are many smaller projects to try before we jump into a gondola and destroy the scenery of the beautiful canyon</p>	brett wanek	Website
5238	<p>I support and agree with the gondola works project. This would not only help save our canyon from all the car traffic and pollution but also addresses the long term. We are only going to grow. We need to be able to support this growth. Thank you.</p>	Jenivere Stotesbery	Website
5239	<p>Dear Udot, I think that increasing the bus presence and keeping the road the same width is the best way to go about managing the traffic for Little cottonwood canyon, as well as adding a substantial toll to single-occupant vehicles to help convince people to ride the bus. The bus option gives backcountry skiers more options than the gondola.</p> <p>My second choice is the gondola. Although the gondola sounds like a cool idea, I don't see it being as economical as well as it isn't as convenient because one would still need to ride a bus to the pick-up location as well as it only covers 1/3rd of the current traffic going up the canyon so it doesn't seem like the right choice for the future traffic increase.</p> <p>The best locations for the parking areas seem to be at 9400 south as well as the gravel pit. I fully support these areas. I think we should consider a parking structure at the current parking lots to see if that would decrease the cost of the project. A parking structure would be very nice because it would require less plowing and upkeep than a large flat parking lot while taking up less space. I would recommend that the parking garage has multiple exits to keep traffic inside flowing smoothly</p> <p>Hope this helps!</p> <p>Thanks, David Maack</p>	David Maack	Website
5240	<p>I support the increased bus service option because it is least destructive and will be least expensive total cost for decades</p> <p>Dear UDOT & associated Stakeholders, A few months ago I was a public commenter who had suggested looking into a gondola as part of the solution to transportation in Little Cottonwood Canyon (LCC). After reviewing your executive summary and some of the reports, I now find myself in opposition to the gondola. I urge UDOT to proceed with planning for an enhanced bus route with no road widening in the canyon—I am particularly in support of concept B1. It is the most cost effective option that also will transport the greatest amount of people during peak hours. It will also decrease vehicle pollution by not accommodating for continued private vehicle use with a new bus lane. Watershed health is a priority for all of us and should not be sacrificed at any cost. Concept B1 could be made great with further refinement.</p>	Andrew Verge	Website
5241	<p>I appreciate the locations UDOT reviewed for mobility hubs. There are many great suggestions and ideally each of the convenient access locations should be designated as a mobility hub. My experience at any parking lot to get up either canyon in the past few winters has been dismal—it'd be much better to have numerous options in the valley close to rather than only the few crowded ones on/ near Wastach Blvd. I am however seriously concerned with the lack of mobility hubs that would serve transit users further north and west. Each of the reviewed alternatives is quite a drive from any residence in Salt Lake City, any residence in proximity to State St. other than neighborhoods near Fashion Place, and especially any residence west of I-15. I strongly urge UDOT to develop a mobility hub proposal that would serve residents and visitors of the west side of the valley. This is not only an proximity issue that impacts folks who don't live by the proposed mobility hubs. Most of Salt Lake County's residents of color, and low-income residents who would most benefit from year-round transit access to LCC live west of I-15. Seriously considering transit hubs alternatives in Midvale, West Valley, and West or South Jordan will overall decrease traffic in already congested regions and could serve to improve racial and economic equity in canyon enjoyment.</p> <p>I am opposed to the gondola alternative for a few reasons—first, it's deficiency in loading/ unloading stops. A gondola that would serve the public would stop at popular backcountry ski access points, hiking trailheads, the campground, important rock climbing areas, and other areas that serve public recreational use. The proposed gondola alternative only serves ski resort users; that is a major deficiency in public service. It only serves one kind of canyon user during one season of the year. Our transportation solution should serve all people who enjoy LCC in various ways, including outside of the ski season. Enhanced busses would better serve people's ability to access several spots in the canyon as the time of year changes where and how people enjoy LCC.</p> <p>Thank you—I am looking forward to my many years ahead enjoying LCC hiking, picnicking, and backcountry skiing via bus for my many years to come!</p>	Olivia Juarez	Website
5242	<p>I forgot something in my previous comment. I'm not convinced that a struggling driver or traffic accident wouldn't affect the dedicated bus lane which seems dangerous and unproductive.</p> <p>I fully support the gondola plus La Caille base station for Little Cottonwood canyon. Not only would it provide parking at the base but it would also transport more people. I hope that this is the decision made for what will be done in Little Cottonwood canyon to lessen the traffic.</p>	Sarah McCloskey	Website
5243	<p>Best, Nick Simpson</p>	Nick Simpson	Website
5244	<p>Please create the gondola from La Caille. It's the best solution</p>	Jennifer Coppersmith	Website
5245	<p>I support the gondola with the base station bring located near La Caille. This best fits my desire for the future of Little Cottonwood Canyon use</p>	Brad Hunter	Website

5246	I believe the Gondola is the best option to reduce winter traffic in LCC. I had the option to take the UTA busses this winter and did not because it would double my travel time to Alta. Increasing busses is a good second option if there were a bus that went straight to Alta instead of stopping at Snowbird first. Busses are another great option during the busy summer season around Oktoberfest. However, increasing bus service does not guarantee more people will use that service. If there is adequate parking and public transportation to the gondola station at the base then I believe traffic would be greatly reduced. However, I need more information on the impact of climbing and bouldering areas in LCC before fully committing to the gondola proposal.	Siani Weston	Website
5247	I am a local cottonwood heights resident, I am all for the gondola, specifically the la caille base terminal and parking structure.	Adam Imbriglio	Website
5248	I would love to see the enhanced bus alternative with NO road widening. Many of us access the lower part of the canyon throughout the entire year, and other options will significantly impact that access. Please consider ALL user groups, not just skiers.	Dana Steck	Website
5249	Gondola with La Caille base station please. Don't pave little cottonwood.	Audrey Hunter	Website
5250	Absolutely!! No Brainer!!	Cindy Galli	Website
5251	I am a resident of Alta and registered voter. I oppose the gondola transportation. It will severely impact the esthetics of a beautiful canyon.	Barbara Jordan	Website
5252	For Little Cottonwood Canyon. I'd like to suggest the Peak Period Shoulder Lane Alternative. I feel this would be a great way to service both the Summer and Winter Traffic. Summer time, allow more parking on the side of the road for White and Red Pine parking areas, plus allow bicyclist the extra room they need to bike safely. Winter time, it would provide the bus routes to allow more buses to get people up the mountain and hopefully relieve the traffic congestion.	Krista Olson	Website
5253	I'm a semi professional skier moving to Utah in the fall. I plan to stay in the area for years to come as I grow my skiing career. I have thought a lot about this project recently, knowing that it could impact me greatly in the future. I have decided that the best option is the gondola. It creates a safe way to get up and down the canyon that people can count on. It would save athletes and employees a lot of stress and time. It would create a money making tourist attraction. And it is the best option for the environment. Thank you, Addy J	Addy Jacobsend	Website
5254	While none of these seem like great options, increasing bus service with no lane expansion is clearly the worst. This would solve no problems at all and is a complete waste of everyone's time. This regressive option provides no incentive to get people on buses. Adding another lane is a better option since buses could at least move faster than the general traffic and there would be some incentive to ride it. Unfortunately, for people like myself, with small children, it would solve none of our problems. The idea of a dedicated bicycle lane going up the canyon in the summer is quite appealing and would add some much needed safe riding options. The gondola sounds great on the surface, but when I read the details, is quite disappointing. If we can't figure out a way to have large-scale parking at the gondola loading point, it would never work. To have to take a bus to get to a gondola load is a difficult and time intensive proposition. Not to mention, buses will most likely sit in traffic getting to the load point. In my opinion the gondola should be promoted, but only if large scale parking can be done at the loading point. Also, it will obviously make sense to widen Wasatch Blvd to deal with increased traffic. However, if the road is widened and speed limits are increased, bicycle and pedestrian safety must be addressed. A dedicated and separated bike lane is an absolute essential for that area. Its already very dangerous to ride and should have safety improvements as it is. Now is the time to make sure this happens.	Stephen Sorweid	Website
5255	A gondola would be overall the best solution. Truly, if you could connect, Big & Little cottonwood and PC resorts via a gondola system (similar to light rail) it would truly be the ideal situation. Or build light rail to the base of each canyon, and then gondolas up canyon.	Will Kieffer	Website
5256	If people wish to drive (namely families), charge a toll or year round pass fee similar to Millcreek Canyon. Gondola is the way to go and I am in full support of recommendations made by Nathan Rafferty and Ski Utah.	Darius Moezzi	Website
5257	I have submitted comments on several occasions since the Mountain Accord days. I was a part of a team of volunteer surveyors during the data collection for Mountain Accord. I spent hours and days talking with people about what they valued most about living in Utah and what their hopes were for the Wasatch front in the future. The surveys were quite lengthy and detailed, but most people were happy to share their opinions. Without exception, people were concerned with protecting the natural wilderness remaining in the Wasatch, making transportation to and from the canyons both affordable and convenient. People did not want to see further real estate development in any of the canyons. I think it would be wise for decision makers to study those survey answers carefully and heed the messages of the people. I have reviewed the current EIS and I cannot see how it addresses the 4 season access needs of the public who would not benefit from buses and would still need to drive automobiles to hiking and backcountry skiing access. Those with plenty of financial resources will always find ways to access natural resources for their enjoyment. Questions: 1. Why is the study only looking at transportation issues for LCC as this is only one part of the congestion. 2. Hikers, bicyclists and backcountry skiers need transportation access to trails. How will they be able to access trails under any of these plans? 3. Have any of the solutions offered considered a yearly recreation fee that is affordable and would allow access to trails along the Wasatch front? I have filled out surveys about the Wasatch several times in the past. For many of us who live in SLC, the overwhelming reason we have chosen SLC to live is the easy access to wilderness areas while having the benefit of an urban area for culture, education and health care. There is no way that I and many like myself would choose to stay in Utah if these wilderness areas are whittled away by development and prices only the wealthy can afford. I am a downhill skier, a hiker, bicyclist, cross country skier, runner and environmentalist. I love all of these activities. I say today and I have said it many times before, I would give up alpine skiing in a heartbeat if needed to preserve the beauty and wilderness qualities so many cherish here in Utah. I am not alone in this sentiment. Once these wild places are gone, they won't be back and what a shame that would be when we have such a national treasure! There are other plans out there, including one developed by Save Our Canyons, that are comprehensive and offer solutions that do not degrade and destroy the environment and are much less costly than any presented as part of the EIS. These should be considered seriously because from I can tell, they more accurately represent the will of the people. Thank-you. Beth Allen Millcreek, Utah	Beth Allen	Website
5258	I use public transportation as much as possible, not because it is faster or more convenient, but because I feel it is the responsible thing to do. Many of my friends do not use public transportation in the canyons (even when covered in cost of ski pass!) because it takes longer, it is uncomfortable trying to manage skis, find seating and gaps in ski bus coverage where they have to wait for unacceptable amounts of time to return to the valley. We need to incentivise ways to get people out of their cars and on to public transportation, not make accommodations to bring more cars into the canyons!	Jolie Iacobelli	Website
5259	3 Wasatch Blvd is already a parking lot on powder days, let's widen it between the canyons and make it a parking lot, add busses, add busses, add busses. Dear Utah Department of Transportation,	Kevin Davis	Website
5260	I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Jeremy Alpenglow	Jeremy Alpenglow	Email
5261	Of the three options, I support the gondola LaCaille Base station option. I would like to preserve the view shed.	Emilee Tanner	Website
5262	I think the gondola idea is fantastic. Less expensive than road widening and an attraction in and of itself. It seems so, strange, to be considering so unique an option. Road widening seems to be everyone's go-to regardless of the consequences in the US. The gondola is not new technology and so is well established and understood in the alpine world; it would be amazing. Letting snow tourists go straight to the resorts could clear the road for those who wish to stop along the way. In the summer it could be it's own attraction as well, focusing the tourists into the established resort properties. Be bold. Utah is already on the map, but this will give it a larger name still.	Jordan Hamann	Website
5263	I am in favor of the gondola with the La'Caille base station. Please do NOT make this canyon a toll road! Preserve this beautiful canyon and the freedom to take an evening drive up the canyon.	Ed Tanner	Website
5264	Widening the roadways will take away from the natural feature that attracts tourists and further contribute to water reservoir contamination. Alternative modalities such as a light-rain or the gondola should be pushed forward. Learn from other communities that have been challenged with these same problems.	Eric Goldstein	Website
5265	I live in the Golden Hills area east of Wasatch Blvd. between Big and Little Cottonwood Canyons. I moved to this neighborhood in 26 years ago. I used to be able to pull my children in small wagons on the side of Wasatch Blvd. from Golden Hills Ave to the horse stables that used to be located on the west side of the road a hundred yards south of the fire station. We moved to this part of the valley for its natural beauty and rural feel. The fact that, on occasion, ski traffic packs Wasatch Blvd. between the two canyons is no reason to destroy the rural nature of our residential area. It is completely illogical to build an expressway between Big and Little Cottonwood Canyons when there is no way to get that traffic up the mountain any faster once travelers reach the mouth of the canyon. There needs to be a mass transit alternative in place before any thought is given to turning our section of Wasatch Blvd. into a high-speed expressway. If anything, we should be slowing down traffic on this section of Wasatch, not speeding it up. Over the past twenty-five years, traffic volume has not increased to the point where it's a problem for us. But vehicles driving down that stretch of Wasatch at 80 MPH has created a significant safety issue and contributed to sound pollution from racing engines on cars and motorcycles. Please slow traffic down and enhance our two-lane road with nice bike lanes. Do not destroy the rural feel of this neighborhood with a five-lane expressway simply to appease the occasional skier and the deep pockets of the ski resorts. Thank you for your consideration.	Paul Bruno	Website
5266	I believe that the best choice is the gondola. It costs less than the enhanced busing with road widening and would be just as efficient. I understand that some would think the gondola would be a big change, but I see it as an opportunity to write a new chapter of the history of Little Cottonwood Canyon. This would set an example of how to deal with tremendous traffic congestion while also reducing the harmful emissions.	Brock VandenBerge	Website

5268	<p>Thanks for taking the time to review the thoughts from the public.</p> <p>I'm not a fan of any of the proposed options, but I would put Enhanced Bus with road widening as the best option of the three.</p> <p>The idea of having people park away from the canyon, take a bus to the gondola and then ride the gondola up the canyon is crazy. One of the many reasons that people ski little cottonwood is its proximity to home and ease of access. Adding more time to that process in addition taking away the idea of using a car as a "locker" in a parking lot at the base of Alta or Snowbird just won't motivate enough locals to make it worth it.</p> <p>If a gondola is going to be used, there needs to be sufficient parking at the base gondola station. Like a lot of stalls. (If I understand it properly, that's what Alta is proposing.) Additionally having to transfer gondola's at Snowbird to get to Alta seems silly. Certainly there's got to be a way to let people at least stay in the gondola even if it means slowing down at Snowbird.</p> <p>What doesn't seem to be taken into account is the hassle of skiing with a family. It's one thing to deal with all of your own gear, but to get kids and gear and food on and off a bus, then on and off a gondola and then on and off another gondola (to get to Alta) PLUS having to pay for a locker once there - I'll just take my chances with driving and being stuck in traffic. Except for the few worst days where avalanches close the road, I'd rather spend the extra 40 minutes in bumper to bumper traffic because everything I need is there in my car.</p> <p>Because of this, I would also look at these options:</p> <ol style="list-style-type: none"> 1. Give family and/or carpool access to bus lanes (let's say it's 3 or more people per car). 2. Increase family and/or carpool parking options at resorts 3. Give priority access to at-resort parking for locals 4. Have resorts offer free day lockers (the lockable kind) for those using public transportation (and build appropriate access for these) 5. Issue snow tire preapproval passes for those prepared to enter the canyon (with the right gear) to speed the process of getting up the canyon. Even giving them a priority lane so they can skip the inspection process. <p>With all of that being said, here's my preferred solution...</p> <p>If I were running the show and didn't have to deal with any stakeholders, here's what I would consider:</p> <p>Widen BIG Cottonwood Canyon's road to be 4 lanes plus bus lanes and then put a parking structure and gondola station at or near Brighton. Take the Gondola up and over to Alta. Initially, the gondola would truly go up, over and down, but I'd leave room at the top for a mid-station for future development by Alta, Brighton or Solitude.</p> <p>This would mean that UTA could focus all of their bus offerings in just one canyon instead of both. Because the future of ski areas consolidating and merging seems to be inevitable, the cottonwood resorts will probably be together in one way or another anyway. They basically already are with the ikon pass and that doesn't seem to be changing any time soon.</p> <p>The road in LCC would also still get key snowsheds so that plows no longer have to spend so much effort in keeping those clear and avalanches can run their natural course with little effect on traffic. Locals and families can use LCC and visitors and singles can use BCC. Everybody wins.</p>	Holland Newton	Website

5270	I am curious to find out what blog system you are utilizing? I'm having some minor security issues with my latest blog and I would like to find something more safeguarded. Do you have any recommendations?	Aidan Coungeau	Website
5271	I worked as a ski instructor/guide at Snowbird from 1972 until 2009. Since my retirement, I have continued to ski 60 to 90 days. I like to drive up, but in the last few years, that's been impossible. I truly believe a gondola is the answer. I will ride it every day, as long as it runs on a convenient schedule. (5 am to 1 am would be good. The transport gondola at Telluride runs 24 hours).	Robin Beasley	Website
5272	I support the building of a gondola. The gondola has been successful in Europe in transporting people and would be here in Little Cottonwood Canyon. Pollution would be reduced and the amount of vehicles going up and down the canyon. Adding more busses means, quite frankly, adding increased pollution which is harmful to the wildlife and community at large. Long term sighted goals that cost more is the best choice. I have been stuck in the canyon many times because of avalanches and snow removal. Even if you widen the road and build snow sheds, nothing has been done to reduce the amount of vehicles entering the canyon. I have two time shares at Iron Blossom since 1978 and have seen increased traffic flow over the decades. People love riding the tram at Snowbird and they would love the gondolas, too. Reduce congestion, stoppages of traffic, and really protect our environment by building the gondolas. Let's be ready for the continued increase of year round traffic with the gondola! The costs will be much more in the long run if you don't start the gondola now. Widening the road probably will happen too in the future but the gondola will attract visitors year round and provide a safer experience.	Michael Stone	Website
5273	I've always thought that a monorail system that connects to tracks or starts at south town mall. Up to to snowbird to park city and down big cottonwood to the airport makes a ton of sense.	Mike Anderson	Website
5274	Expanding Wasatch is the least safe alternative for residents of adjoining neighborhoods, and yet it seems to be the only one under serious consideration. Why is that? The road is already dangerous and on the verge of destroying to community feel that drew many of us to the area in the first place. Providing an avenue to cram even more vehicles into a geographically restricted funnel just doesn't make any sense to me.	Bill Ewer	Website
5275	Why not set up hubs to the north and south of the canyons where tourists and skiers can park and provide dedicated mass transit solutions. These staging hubs would quickly draw new businesses and modern day public transportation could actually decrease the amount of traffic across Wasatch Blvd making it safer for everyone and reducing vehicle emissions.		
5275	Consideration of the safety and potential negative impacts to local residents, and maintaining safe access for cyclists, runners, and other non-commuting, or resort-bound traffic should be the top priority. Anything short of that is a failure of responsibility. Let's please work together to find a solution that benefits all parties, not one that benefits the most profitable while attempting to cause as little damage to the community as possible.		
5275	After reviewing the proposed transportation options for little cottonwood canyon it is my opinion that the gondola plus la Caille base station is actually the best option I've seen and respectfully request that it should be added to the three other possibilities being considered by UDOT. A gondola seems to have a lot of attractive benefits over the other two proposals, but a gondola that has no on-site parking and therefore requires a mandatory bus ride and transfer is much less attractive and will likely be utilized by fewer visitors to the canyon. Thank you for your consideration.	Jonathan Jacoby	Website
5276	Dear Utah Department of Transportation, just put in some more buses, and make sure some of them stop at intermediate points for ski-tourers.	Tom Dickman	Email
5276	Sincerely, Mr. TOM DICKMAN

5277	Gondola with the La Caille enhancement makes the most sense	Thomas Hagan	Website
5278	Widening the roadways will take away from the natural feature that attracts tourists and further contribute to water reservoir contamination. Alternative modalities such as a light-rain or the gondola should be pushed forward. Learn from other communities that have been challenged with these same problems.	Eric Goldstein	Website
5279	I support the Gondola Plus La Caille base station option for Little Cottonwood Canyon	Brent Nixon	Website
5280	I support the gondola option with La Caille station, but think that - or any mass transport option - needs to be supported by more lockers at the ski resorts for use by day skiers. If people are unable to access additional boots, clothing or other ski equipment and personal items needed on a given ski day (from their own vehicles) they will need to bring a ski bag in addition to skis and poles. Having a secure place to store those extras for a comfortable, warm and safe ski day, would really help make any form of mass transportation a much more convenient and acceptable option than individual vehicles. You must make it convenient recognizing the needs of skiers and non-skiers, especially with family members, and give them better ready access to such items. Then "having someone else drive" (whether that's getting on a bus or a large gondola) for a long ride to the ultimate destination, is an easy sell. Nothing like losing a glove, needing different goggles or a hat, or an extra warm layer, to sour the experience of losing the resource of your own vehicle - which is often for "more than transportation" and is a place to readily access those personal items. Skiing is already expensive enough without having to spend more in a ski shop when you have extras in the car. Having a secure place for day skiers to "access their stuff" addresses that, and the main issue that distinguishes mass transport from private vehicles. Thanks.	Dolly Garlo	Website
5281	PLEase build the gondola	MATT LAndry	Website
5282	UDOT needs to prioritize safety above speed and capacity. Validate local access concerns such as: • Local traffic turns in and out of eleven residential streets during heaviest ski and commuter traffic periods. • Provide safe access up to federal guidelines for all users that are expected to utilize this residential stretch of Wasatch Blvd including bicycles, pedestrian, park going people, kids going to school, etc. They have been forgotten while UDOT tries to make improvements for better access for ski traffic and commuters. • Three-lane configuration is still the best model. If busses will travel without stopping from the Gravel Pit mobility hub (skiers) or 9400 South & Highland (commuters) to a destination outside the urban segment of Wasatch Blvd, then they do not need to travel in the shoulders (where they would be needed if they were to pick up passengers within our city). UDOT/UTA have already confirmed that Express Bus service to each resort is requisite. Likewise, it is necessary that UTA implement Express Bus service for commuters heading to Research Park, U of U and downtown. Since most recreation and commuter travel is unidirectional, there is no need for two bus lanes. Locate one Express Bus Lane in the center between one lane in either direction. Commuters travel north in morning and south in afternoon on weekdays/non-holidays and recreationists travel south on weekend/holiday mornings and north on those afternoons. One lane will satisfactorily handle the Express Buses. A simulation of this traffic model could be developed and presented to the public for further comment Also the speed limit should be 35!!!	Jake Nicholson	Website
5283	I support the Gondola plan but only as part of a larger transportation infrastructure plan which includes access between the cottonwoods and park city that is not reliant upon automobiles or buses. A simple free bus that runs only within the canyons (like the snowbird shuttles) to transport backcountry trailhead users, as well as waste disposal and other necessary services could still utilize the road w/o the headache of public traffic. It does not seem like a parking structure or gondola base within the canyon would do much to alleviate traffic attempting to access the proposed location. Perhaps a larger space closer to the interstate (like the massive gravel mine? to the north of the mouth of BCC) could accommodate a more appropriate base facility and support other commercial interests (and private funding!!!). Thanks for reading and allowing comment. -jb	Jonathan Keller	Website
5284	I'm a resident of Cottonwood Heights. Close to the proposed widening of Wasatch Blvd. I'm against a wider high speed multilane highway proposed by UDOT. A two mile stretch from Big Cottonwood canyon to North Little cottonwood Rd only to funnel down to two lanes is rather odd. There are matters of Air pollution, Noise pollution, wild life concerns, recreational safety, and environmental damage. The proposed 7 lanes, which includes bike lanes, which are feet or inches away from 50 mph plus vehicles is concerning. The freeway system has no bike lanes. But yet they are included in the widening of Wasatch with 50mph + speeds. From Big Cottonwood south is a community of family's, with children, grand parents and pets that frequently use Wasatch Blvd, for grocery , park and church destinations. This proposed widening of Wasatch Blvd goes against logic and common sense. The Family's of a neighborhood should be top priority. They are the ones who are being damaged. Wasatch Blvd South of 9800 S. is a 35 mph two lane road carved through a neighborhood. During winter time, when the canyon is closed for avalanche control, the cars back up on this road, just like cars north of Little Cottonwood. Looking at Google Map I could see where Highland Drive south of 9400 S. has a designated roadway ready to be finished. By not finishing this planned roadway , commuters are forced to use Wasatch Blvd, which only enhances traffic problems, especially during ski season. My question is , why not finish Highland Drive to the gully? If you are going to improve Wasatch Blvd , build a beautiful gateway to the canyons. You had a great idea and did it right south of 9800 S. Wasatch. Just extend that idea north. Put in a special lane for ski back up traffic, with signs for visitors. OPEN/CLOSED Lighted canyon signs at least a mile prior to canyon so skiers can stop off for breakfast and coffee. Bus service that is adjustable for snow days. Please.....don't put in a 7 lane high speed highway through our neighborhood.	Ron Schroeder	Website
5285	We live at the mouth of Little Cottonwood Canyon on Wildcreek Lane. The Peak Period Shoulder Lane Alternative would very much effect our home. We built this house to be able to retire in & not have the parking/emergency lane pushed into our back yard. Since we have lived here, we already have home damage from the snow plows throwing snow into our house, windows & roof. Widening the roads will only increase the amount of skiers we get in our canyon during the peak seasons. Their needs to be encouragement to take public transportation or to fill up the cars. This could be accomplished with a canyon toll booth. There needs to be a free flowing lane for buses & canyon residents (maybe a sticker on their windshield so they an pass freely) while all other vehicles pay a toll. This will encourage public transportation plus gain some revenue to repair damage that is done yearly to our beautiful canyon.	Amy Butterfield	Website
5286	Enhanced bus service with widening the road.	Dennis Mills	Website
5287	Enhanced bus service with widening of the road.	Joan Mills	Website
5288	Enhanced bus service bit you must also widen the road.	Joan Mills	Website
5289	Only enhance Wasatch Blvd by one express lane. Build La Caille Base station for 30 gondola System. I rode one in Zermatt in Jan 2020 and it's a super efficient system, great views, everyone has seats, it moves an incredible amount of people that get to enjoy themselves during the transport. It would be a great tourist attraction - it's really a nice clean efficient and fun ride. This would be a solution for future generations.	Sue Bounous	Website
5290	Putting a gondola up Little Cottonwood Canyon is one of the more ridiculous ideas that I have heard. You're going to permanently scar a canyon so you can get a few skiers crammed into a gondola? And to do that you need to build a giant parking lot and permanently ruin the beautiful vista of that glacially carved canyon? What a boondoggle! Work on getting more buses up and down the canyon more efficiently and stop trying to turn the canyon into Disneyland.	Jeff Clay	Website
5291	Strongly support enhanced bus service and absolutely oppose any road widening or gondola construction.	Tom Macfarlane	Website
5292	Hello, my name is Natalie W. and I wanted to voice my opinion in opposition of UDOT's plans to further develop Little Cottonwood Canyon. Because of your rejection of input from locals and foundations such as Save Our Canyons, the plan does not take into account the ecological damage that will take place from any of the 3 options. Furthermore, the plans will almost certainly fail because they operate within the framework of this being an infrastructural issue instead of a behavioral issue. A gondola will not be effective for several reasons, one of which being that it will still require the vast majority of canyon patrons to use other means of transportation. Additionally, it requires either a massive amount of parking near the mouth of the canyon, which there is not space for, or an effective transit system, which does not currently exist. The road widening will not effectively control traffic and the amount of cars in the canyon because it will encourage individuals to drive themselves up the canyon, which is the problem in the first place. While it may temporarily improve the flow of traffic, it will certainly not decrease the amount of vehicles in the canyon. Simply put, UDOT should not have this money; it should be given to the UTA to invest in better transit options. One way this could work is by having many more bus routes throughout the city that terminate at the LCC resorts. Making public transit actually convenient is one certain way to increase ridership and decrease canyon traffic volume. Another method would be putting tolls in place that encourage carpooling up the canyon. Thank you for reading and considering my comment, Natalie Weed	Natalie Weed	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5293	<p>Hello EIS Crew,</p> <p>I've been taking either the bus or the UTA ride share employee van for seven seasons to Snowbird- I have never driven in the canyon in my personal vehicle to the resort. While riding in the van or on the bus I look around and see many single drivers going up and down the canyon which annoys me to no end. Riding the bus, however, has its downsides. I've heard of people being stuck on the bus for up to five hours on their way up the canyon on a powder day. This is very unsafe due to avalanche concerns, not to mention that once you're on the bus they don't let you off and I can't imagine five hours on a bus with a full bladder!</p> <p>The best long term solution is the gondola option at La Caille. It is a cost-effective, long-term solution to problems we've been trying to tackle for years. Any road option is short-sighted and doesn't solve the problem. Getting people off the road is the only way we can protect the canyon and plan for future year-round demand.</p> <p>Utah's air quality is bad enough. We need a solution that cuts down on carbon emissions and reduces dependence on cars on the road. A gondola is the most environmentally-friendly option that takes into account air quality, water quality, and energy efficiency.</p> <p>I am sick and tired of traffic in the canyon and I think a gondola is a great alternative. The La Caille base station for the gondola is a game changer in addressing parking and congestion at the mouth of the canyon. This needs to be studied as the preferred gondola scenario. More buses and a wider road don't solve the problem. If an accident or avalanche shuts down the canyon, it doesn't matter how many buses or bus lanes you have – everyone has to wait and everyone is stuck in traffic.</p> <p>Widening the road and building snow sheds does more harm to landscapes that are already at risk of being damaged and lost. Please don't widen the roads in Little Cottonwood Canyon! The gondola at La Caille is the best choice. Three snow sheds will not change the icy surface whenever a storm hits the canyons. It is my opinion that rubber tires, ice and snow do not mix when we are talking about 1000's of vehicles traveling that canyon every winter day.</p> <p>Yes you can make the road wider with more lanes but then you just have more vehicles going up and down. You have designed dedicated Bus Lanes, but have you ever driven up the canyon on a Powder Day? People presently do not follow the laws on not crossing double lines. Many mornings the race up the canyon has cars three wide trying to be first to the chairlifts. Coming down the same happens, generally with one or more cars coming in contact with each other or the mountain. There is no way to delineate the bus lanes other than markings on the roadway which will be covered by snow even if people followed the safe driving laws. Asking the UPD to increase traffic enforcement will just bring folly as on heave traffic days as there will be no place for an officer to pull someone over. More lanes will but only be more problems.</p> <p>Snow Sheds? The plan is to protect 3 avalanche paths when there are 64 known slide paths in the canyon. The study is two years old and did not include this past shortened season where huge slides came down in place not seen in years. Why this year? Who knows, but maybe with global warming, debatable to some but not to any skier I know, the type of snow is changing. With those changes, how soon will more of the slide paths come into play beyond the main 3. Will we just build more and more sheds?</p> <p>Taking a bus up and down the canyon with a young family is stressful, uncomfortable, and unreliable. A gondola is a much more enjoyable experience and allows my kids to see Utah's beauty from a new perspective.</p> <p>I understand why a gondola is ideal for skiers on peak snow days, but it also provides another activity for my family to enjoy during the summer. This would be something I could share with out of town visitors for a day outing.</p> <p>Too many times people are stuck up the canyon when an avalanche shuts down the road. A gondola takes that problem away entirely. A gondola provides the safest way to get up and down the canyon in winter weather. Finding parking is often a deterrent to heading up the canyon in the summer. An alternative way to get there without the parking hassle and dangerous roadside conditions would make it so much easier. The gondola at La Caille is the only option that offers the opportunity for public/private partnerships that help offset costs to the taxpayer. Otherwise, Utahns are paying for more pavement that serves as a band-aid fix.</p> <p>What needs to be changed from the EIS is access to the Gondola. Based on the existing plan having one Mobility Hub is not enough. People will not drive past the mouth of Little Cottonwood Canyon only to ride a bus back. Anyone coming from the South will turn East on 9400 South and just drive up the canyon. So much for cutting traffic. This was proven a few years ago when UTA cut the busses from the North expecting people to drive past the canyon to catch the bus at 9400 South and 2000 East. People will just not do it. And not having the space to allow people to at least drop people at the Gondola base is just asking for trouble. People in my opinion will drive their kids up rather than take them to the Gravel Pit Mobility Hub if they are coming from the South.</p> <p>A better for all would be busses from 9400 South & 2000 East and the Gravel Pit going to a Gondola Station at the La Caille Base Station as proposed by those who have formed www.gondolaworks.com.</p> <p>This proposal seems to solve more issues than having one or even two Mobility Hubs.</p> <p>In my opinion this solution would provide an option that will work much longer into the future than any of the options making changes to the road or the one Mobility Hub.</p> <p>Plus it would add more parking which looking into the future will be always needed.</p> <p>While you may see my canned answers as a form letter I wholeheartedly agree with the points put forth. The gondola is the best long term solution.</p>	Marry Stewart	Website
5294	The gondola alternative will only help with a small percentage of the traffic in the canyon. It will disturb the pristine views from the road. One of the great pleasures of travelling up the canyon is the ability to see undisturbed nature. Please focus on more convenient public transportation and find ways to make taking the bus fun and fast.	Molly McFadden	Website
5295	Little Cottonwood Canyon is a refuge from the city and a special place for so many. Widening the road or putting a gondola in it would further damage the canyon and recreational opportunities. Please focus on Enhanced Bus Alternative (without roadway widening), to protect this amazing place.	Nikki Smith	Website
5296	I would ask UDOT to please add the Gondola PLUS La Caille Base Station to the other three alternatives it is considering. This option seems like it has considerable advantages over the existing gondola option including increased capacity and the ability for a considerable number of people to park on site which would drive more usage than the mandatory bus to base station and transfer option. And in general the gondola option sounds better than the two bus only options because it is environmentally friendly and can be used when the road cannot due to avalanche danger.	Suzanne Jacoby	Website
5297	I support the new gondola solution.	Carbon Lundgren	Website
5298	I believe that enhanced bus service and incentives for car pooling are the best alternative. No gondola, no snow sheds , and no widening of the road.	Paul Paris	Website
5299	please consider a tram up little cottonwood with parking near 9400 s and highland dr..please get the highland drive extension to 10600 south completed..Wasatch Blvd has become the main artery for commuters, when ski season is here, it is a joke and dangerous..SLOW DOWN THE TRAFFIC!! thx	Jeff Chatelain	Website
5300	No gondola please.	Mindy Thompson	Website
5301	<p>EIS Proposals Comment July 9, 2020</p> <p>I do not support any transportation solution until a carrying capacity study is conducted. Skier experience is currently being degraded by having to sit in your car for hours to get to and from ski area destinations. However, increasing transportation capacity could easily overwhelm the crown jewel of Utah (Little Cottonwood Canyon) and shift congestion from the roads to the ski areas. Hours-long lift lines will surely turn customers away just as much (maybe more?) than a long commute. A carrying capacity study in the EIS should survey users to ensure they understand this trade-off and decide which they would prefer (traffic on the road or long lift lines).</p> <p>After carrying capacity study, I support expanded bus service without widening the road. Buses are flexible (can increase and decrease according to demand). They could be given early morning priority to incentivize ridership.</p> <p>I support the addition of snow sheds to reduce risks to users who are stuck in traffic during high avalanche danger.</p> <p>I support all trailhead expansions. These appear reasonable and much safer.</p> <p>I support Tolling (which many ski areas have already started on their own!). Tolling will reduce the number of single-occupancy vehicles. Combined with frequent, economical buses, the carrying capacity would be served. I would like to see a tolling study in the EIS and it's impacts on canyon congestion.</p> <p>I strongly oppose the gondola solution. In every scenario I imagine, users will be greatly inconvenienced. The 'powder frenzy' to get up the canyon will be shifted to getting into parking spots for the transit hubs, then a lift line for the gondola! People's overwhelming excitement will be diminished quickly and they will resort to their vehicles. And, in the end, without a carrying capacity study, the lift lines will greatly discourage users at our ski destinations. The gondola also requires a stop at Snowbird, which will disincentivize Alta skiers. It does not serve any trailheads.</p> <p>The proposed solutions also need to address dispersed users. The whitepine trailhead is currently overrun for such a vast area of terrain it serves (with people regularly parking on the roadway). Busing could easily service this trailhead and reduce cars on the roadway. Busing could also easily service other trailheads if requested by riders by ringing the bell (of course at safe pull-out, designated stops).</p> <p>Final thought is convenience. As an Alta skier and a backcountry skier, I cannot—under any circumstance—envision myself using the gondola. It would be a major inconvenience to get in my car, drive to a hub, wait in a long-and-powder-panicked line to get into a parking spot, wait in a powder-panicked line to get on a bus, wait in a powder-panicked line to get on the gondola, AND waiting in powder-panic for Snowbird users to get off the gondola. Then, at the resort, I won't have a car to store my extra clothes and food, so I'll have to push my way through crowds competing for lockers... And only then, would I get to line up in a 2 hour lift line (still in powder-panic)! Not good. While this opinion is clearly selfish, I propose this opinion for consideration because I believe I am not the only person who would do this calculus. An EIS should study user behaviors and survey them on these scenarios in order to understand user sentiment and behavior to optimize a much-needed solution.</p> <p>Thank you for such a daunting undertaking. This is not an easy problem to solve!</p> <p>Best Regards, Colin Gregersen</p>	Colin Gregersen	Website
5302	This EIS fails to: address reduced vehicles in the canyon, address transit for dispersed users, create connectivity to a greater transportation system connecting along the wasatch front and back, present a carrying capacity of number of users the canyon as it correlates to environmental and watershed health. If tolls are implemented, funds need to be invested back into stewardship of the canyon. I do not support the gondola or the third lane. I support electric clean energy shuttles in the lower canyon for dispersed users and more busses without the option for resort skiers to drive their cars.	Julia Geisler	Website
5303	It is necessary to have as alternate travel. It gives a sense of security and with the future global warming, the roads might face more avalanche debris and other damages.	min liang	Website
	Thanks,

5304	I support the enhanced bus system option.	Paige DaBell	Website
5305	<p>Hello,</p> <p>I live near the mouth of LCC and am in the canyon several times a week all year. I am a rock climber, ice climber, and backcountry skier. I have not skied at a resort in years. My biggest concern with all of these plans is the continued access to backcountry ski terrain as well as ice and rock climbing.</p> <p>I believe that drastically increased bus capacity in combination with a large parking lot at the gravel pit near BCC would be the best way to go given these three options. I'm concerned that expansion of the road would lead to destruction of classic climbing lines in LCC, many of which are extremely close to the existing road. I'm concerned that with the gondola there would be additional access to the backcountry from non-backcountry skiers, which would lead to more crowding, more danger, and eventually closed access points.</p> <p>With all of these options I'm concerned that the parking situation for non-resort skiers would suffer. It's essential for backcountry skiers to be able to park in a wide range of places in LCC in order to access the terrain that has been left to us after years of resort expansion. If this access is closed, or the ability to drive into the canyon for non-resort skiers is removed, then backcountry skiing and ice climbing will essentially be shut down.</p> <p>Please consider all of the users of this canyon, not just tourists who fly in to ski "the best snow on earth" on groomers, get drunk at GMD, and then leave. We live here, let us use our backyard.</p> <p>Thank you,</p> <p>Adam</p>	Adam Riser	Website
5306	<p>I realize this study is for one specific UDOT road, but addressing transportation challenges in Little Cottonwood only with this study without addressing and studying Big Cottonwood at the same time is not the right solution. A more encompassing study addressing both canyons at the same time with a broader study area that could look at more park and ride locations further away from the mouth of the canyons in partnership with UTA should be done.</p> <p>Implementing solutions starting at the proposed mobility hub on Wasatch Blvd will not alleviate the dangerous backup onto I-215 that happens on the busiest ski days.</p> <p>Please consider more options/incentives that would get people out of their cars and onto the buses in the enhanced bus scenarios like tolling cars entering the canyons (higher rates for cars with fewer people), encouraging carpooling to the mobility hubs by charging less for parking there, looking at more regional hubs that would need less traffic accessing Wasatch Blvd.</p> <p>Parking on the side of the road at the resorts needs to be banned. Safety concerns for skiers walking on the road and cars trying to leave the ski areas but can't see around the parked cars to enter the canyon road.</p> <p>More buses, less cars.</p>	Jodi Pearson	Website
5307	The final LCC plan should prioritize and focus on Enhanced Bus Service in conjunction with better parking options in proximity to both canyons, possibly in conjunction with snow sheds. It should not include in anyway vehicle lane additions as these would be entirely counter productive to the overall goal of addressing the ever worsening traffic and congestion concerns. Similarly the Gondola/Mobility Hub alternative is extremely inefficient, cumbersome to access and ultimately a disincentive to getting skiers out of their cars.	Bryant Scrafford	Website
5308	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Sincerely, Mr. Todd Passey</p>	Todd Passey	Email
5309	<p>Put an end to the gravel pit at the bottom of Big Cottonwood.</p> <p>Use that space to put in local shops, lots of parking, and a bus hub that is used to service both canyons.</p> <p>A combination of buses and a gondola would be ideal, in order to decrease traffic.</p> <p>A Gondola needs to be of higher priority if we are to think in the long term.</p> <p>Thirty to fifty more years (or longer?) of increased vehicles use on the road polluting our watershed, destroying wildlife and the environment should inspire more horror, dismay and disgust.</p> <p>Let's truly think long-term for the betterment, health, enjoyment, and ease for future generations.</p>	Robert Dela Cruz	Website
5310	The gondola is a terrible idea. It moves only 50 more people than the simple enhanced bus service yet costs \$100 million more while forever altering and damaging the beauty of the canyon by forever building more infrastructure. We cannot build our way out of the congestion in LCC. We must change people's behavior and attitudes toward transportation within the canyon by using a comprehensive transit plan that UDOT seems unwilling to consider. The reality is that all three alternatives are construction half measures that don't work to understand and enforce changes in behavior. We need more administrative measures such as stopping people from lining up at the mouth of the canyon, tolls for low occupancy vehicles, much much much greater bus service, no parking on the side of the road in the canyons, etc. Unfortunately, UDOT is a construction agency and not a transit agency and is therefore incapable of working with non construction alternatives. So, if we must, we should move forward with the least expensive and least infrastructure intensive alternative. Remember, it is the natural beauty of the canyon that draws thousands of people to the canyon, not the infrastructure.	Andrew Castor	Website
5311	<p>Good Morning;</p> <p>I support Option 1 of increased bus services.</p> <p>I'm a cottonwood heights resident and I've used the Udot bus service when working at snowbird. However, since I've stopped arriving at the resort early (7am for work) and leaving late (after 6pm) I do not find the bus service convenient despite having free access with my ski pass and a bus stop in front of my house.</p> <p>My preference would be to drive to the mouth and take the bus shuttle (Udot) to the resorts. This is currently not an option as there is no place to park at either big or little cottonwood/swamp lot, etc. Furthermore, when leaving the resorts, increased bus service would make this more accommodating due to passenger volume. Also, There needs to be a contingency plan for road closures and bus service. On rides that took 4 hrs to get home from Alta last year I had friends stuck on busses. Until that is addressed, I can't get on a bus. I can't hold my urine for 4 hrs standing on a bus.</p> <p>Take home message from my input is I used to be a UDOT user, But I haven't ridden one of your busses in 20 years. I love snoozing on the bus and letting someone else drive, but I find your overall service inconvenient and unnecessary. I think the proposal 1 options address the inconvenience issue. I do want to reduce traffic in the canyon and I'm willing to ride the bus, but I can't be stuck on a bus, nor am I interested in waiting in lines to leave the resorts at the current UDOT schedule.</p> <p>Alternative 3: The Gondola option is a folly (neat idea) but the road will still be there and heavily used.</p> <p>Alternative 2: Widened roads in a tight dangerous canyon seems like an extreme engineering feat and really offers no benefit of the PPSL. I do like that the PPSL would be used for bikes/peds during the summer, All plans should include a dedicated bike/ped lane but I know bikes and pedestrians aren't part of UDOT's goals or priorities (See the entire Salt Lake Valley, and all of Utah for reference).</p> <p>Thank-you for taking comments on this.</p> <p>I appreciate your efforts to spearhead and work through this issue. Personally I don't know who is complaining, I drive that road every weekend and big cottonwood during the week. I accept the delays due to weather as ""acts of God"" and do not blame them on Ikon pass, or tourists. Truth be told, there are enough skiers in Utah to clog those roads, independent of tourists or Ikon pass holders. Also I like that the flow of the road slows skiers to the resorts, and I know I have to plan my departure on snow days if I want to be home before 8pm. I don't view this as a UDOT responsibility, we all are responsible for the crowds and traffic. Nobody is asking UDOT to fix the lines at Disneyland, Why does UDOT have to fix lines to our favorite ski areas?</p> <p>I support solutions that are the least environmental impact, low cost, and provide actual solutions to commuters. We saw canyons close last year due to volume of cars. that is the natural consequence or our behavior. We don't have to build a gondola because people want to ski when it snows, we just need to push people toward busses, I'm committed, you need to do your part now.</p> <p>Thanks again, I appreciate your work on this project.</p> <p>Tad Turgeon</p>	Tad Turgeon	Email
5312	<p>Please no gondola!</p> <p>Worse for environment than major parking at base of canyon with 20min pick up drop off 24 hours. charge too much to park at resort and change the driving pattern. Less traffic. Less construction. Less money.</p> <p>Do the most to protect the land NOT keep constructing!</p> <p>Thanks</p>	Sarah Buchmiller	Website
5313	i believe that if we are going to improve the the transportation issue up the canyon, we should move beyond cars and install a gondola.i understand that everyone's travel patterns will be changed, but this will best alleviate the crowded road in a 21st century way...	Rob Voyer	Website
5314	The gondola.	Korbin Birrell	Website
5315	I fully support the gondola option, so long as there is a proper parking structure. We also need better UTA connectivity from Trax to the base of the canyons.	Justice Morath	Website

5317	I think the Gondola proposal would be the best plan moving forward.	Dustin Buckthal	Website
5318	Gondola!	Amber spillet	Website
5319	love the gondola option. Please don't put more pavement by enlarging the road.	Chase Dickinson	Website
5320	I am in support of the gondola alternative. I am a backcountry skier, rock climber, and ice climber. I do not ski in the LCC resorts. The gondola alternative seems to affect my demographic the least, while helping to ease the burden on the road. I believe that widening the road and increasing its capacity will have a huge negative impact by not directly addressing the issue at hand.	Jonathan Vickers	Website
5321	As a climber, I and the SLCA support the Alternative of Enhanced Bus with no additional roadside capacity. While the widening of the road may have benefit and I believe adjustments to the parking situation could be helpful, my primary concern is preserving the climbing resources that are both enjoyable and historical. Additional parking or road capacity could alter not only the access to our recreational resources, but I fear boulders and climbing routes could be impacted if not lost forever. Transportation needs improved, but let's not over-do it and affect things we cannot get back.	Phillip Symons	Website
5322	Please choose the enhanced bus during peak season. Anything that would minimize the destruction of local climbing areas.	Kris Carrigan	Website
5322	Also please do not pick the gondola as it would greatly decrease the beauty of the canyon.	Roland Gilmore	Website
5323	Hello, I writing to voice my support for the Enhanced Bus Alternative without additional roadway widening. Thank you, Kris Carrigan	TAYLOR HARTMAN	Website
5324	No Gondola. I use different access points for both backcountry skiing and climbing. A gondola negatively affects those recreational experiences.	TAYLOR HARTMAN	Website
5325	This constant barrage from the ski resorts to expand tourism focus at the expense of local residents and nature is deeply troublesome and will come back to haunt us! Stop this incessant nonsense	Brandon Laws	Website
5326	I need to see all unbiased studies on canyon capacity before action is even considered		
5327	I support the gondola plus la caille base station proposal. We need a long term solution that puts the environment and health of the community first. More cars and bus service up little cottonwood is not the answer.		
5328	The proposed gondola up Little Cottonwood Canyon would do little to solve the transportation problems facing the area and would only encourage more drivers, which is what has caused this problem in the first place. First of all this gondola will require two transfers, from car to bus to gondola which will be logistically problematic. The plan identifies a 2,500 car parking garage at the mouth of Big Cottonwood canyon. This will cause a few problems. First, anyone driving from south of the canyons will need to drive past Little Cottonwood (presumably in traffic) to park in the garage. If they are coming from the north, they will still need to line up to enter the massive parking structure. Then both groups will need to catch a bus to the base station and then transfer to the gondola. Not only does this plan create a logistical nightmare at the base of the canyons, but it puts way too much emphasis on vehicular travel. Encouraging automobile travel is the opposite of what we need in our canyons. We need to have viable alternatives to personal vehicles. The fact is that although these ski resorts are in beautiful mountain terrain, they are at the edge of a major city and need city transportation solutions. This plan spends hundreds of millions of dollars (\$400 Million for the gondola) and doesn't do anything to solve issues in Big Cottonwood Canyon. Big Cottonwood may not have as much traffic as Little Cottonwood, but it is not far behind. We need a plan that addresses transportation issues in both canyons. In fact the 2500 car parking garage for the gondola up Little Cottonwood will be placed at the mouth of Big cottonwood canyon several miles away increasing traffic to get into Big Cottonwood. The gondola plan endangers important sites for other uses in the canyon. The base of little cottonwood canyon is home to some of the greatest rock climbing in the world. People move from all over the world to live in SLC for that climbing, the base station for the gondola will destroy many of the boulders that climbers use and will possibly hurt access to many of the cliffs. It also doesn't identify what will happen to back country users. Will non-resort users be allowed in the canyon? The gondola won't be stopping anywhere except Snowbird and Alta. Back country skiers, snowshoers, and hikers are completely ignored in this plan. The bases of the gondola will require significant construction throughout the canyon, it will also permanently change the watershed and view shed of the canyon. 800 foot tall towers will forever be a part of the canyon views. All for a gondola that will likely only be operating for 3 or 4 months of the year. There are alternative options. UDOT seems to have made the bus plans in its proposals an afterthought. But, unlike a gondola they can be enhanced over time. UTA already has a robust transit system throughout the valley, we can run Bus Rapid Transit like vehicles from locations throughout the valley directly to the resorts. Allow back country users to use the bus by having stops mid canyon. And create tolls for Little Cottonwood in the winter so that people are encouraged to take the bus but can drive to back country locations if they need to. In Salt Lake City we are blessed with amazing National Forests right at our doorsteps. These mountains provide us with clean water and endless recreation. Please don't cave to corporate skiing interests and change them forever. The snowsheds in LCC should be installed starting now. That would alleviate traffic congestion on snow days, which is the most acute problem the canyons face. While the cost is high, it's also a solution that can be implemented starting now and will serve the canyons for decades.	Friends of Great Salt Lake	Website
5329	As for a mass transit solution, whether it is a gondola or enhanced bus service, two things are essential. The first is a very large parking structure at the base of LCC where the mass transit solution is accessed. Without that, users won't utilize the option. Second, the solution needs to run year round and serve all trailheads so that trailhead parking does not need to be enlarged. Summer time trailhead parking is extremely high for the available spots and rather than spending money enlarging those areas, implementing a mass transit solution that stops at all trailheads and runs year round is the best way to solve all of the issues at hand.	Ashley Patterson	Website
5330	Tolling was also a recommended solution and would be advisable, should there actually be a mass transit solution, ie, those who still choose to drive, subsidize those riding mass transit. The tolling wasn't addressed here, but hopefully is being considered in the larger discussions. The only options I support is the enhanced bus service or the enhanced bus service with road widening. The Gondola will be an eyesore in the canyon that is already so small and only further motivates the resorts to connect to Park City. Also, Gondola's are not that reliable, they break down all the time, do you really want a single point failure as your option for getting thousands of people down the canyon?	Branden Michelkamp	Website
5331	As an avid and frequent user (3+ times per week to climb, ski, and run) of Little Cottonwood Canyon, I am concerned with the details of the proposed plans for the road project. I support the increased bus service option, as it will have minimal impact on the environment compared to the road widening and gondola which have the potential to destroy boulders and other recreation near the road in the canyon. However, the seemingly minor detail of removing roadside parking along the canyon will have SEVERE impact to access in the canyon. As is, roadside parking is key for maintaining capacity in the canyon as there are not enough formal parking areas. Wide road shoulders in certain areas makes roadside parking a safe and efficient solution that is already working and should not be changed. Furthermore, without plans for extensive additional parking at the base of the canyon the additional bus service will not be able to be conveniently utilized by intended passengers. The transit hub on Wasatch Blvd may be fine for ski resort goers, but will be insufficient for climbers and skiers accessing trailheads and other recreation site dispersed throughout the canyon. Roadside parking must remain. Finally, I strictly oppose the gondola and road widening options due to the impact they will have on the environment and roadside. Road widening, in addition to being almost twice as expensive, will only shorten transit time and will not increase capacity. Gondola will only increase transit time and have an enormous visual impact and footprint on the canyon.	Billy Barghahn	Website
5332	I support the enhanced bus option with no roadway widening. I fear the roadway widening would impact many current recreation spots near the road (creeks, climbing spots, etc.).	ERICA BINDAS	Website
5333	I absolutely oppose the gondola concept for LCC transportation. It will scar the beauty of the canyon.	Richard Lamph	Website
5334	I support the gondola option, assuming it is run on electricity and not gas that seems like the more exhaust-conscious option. If it is not electric, I support the enhanced busing without roadway expansion.	Leah Smith	Website
5335	All alternatives a focuses on spending approaching a half \$Billion (and like all projects of this scope I expect the real numbers would be over that) to increase the capacity to move people to 2 ski resorts. They are plans to meet a demand without really addressing how our sensitive water-shed and open space for will be impacted by pushing more people up the Canyon. Much of this demand is created by the IKON pass with out of state skiers. While I support tourism I don't support expanding it in our sensitive canyons without a more thoughtful process on on how this impacts our future generation that live in the area and utilize the water our Canyons provide.	J Todd Anderson	Website
5336	I am in favor of enhanced bus transport but without the widening of existing roadways. Thank you	Leslie Keener	Website
5337	I don't see the point of multiple lanes, as all roads to the south ie:9400 S, Wasatch Extension, and LCC road are all one lane, 35 or 40 mph zones. A better alternative would be a two lane road with a third (center?) for busses. Beside lowering the way too high speed limit, the high T light should have a red occasionally for downhill traffic so we can get out of our neighborhood during high volume afternoons. In or out of Golden Hills is a suicide intersections With cars coming down through highT at 50+++ mph.	Kathy Nicholson	Website
5338	Dear UDOT, I support the Enhanced Bus Alternative, without roadway widening, as it would have the least impact on LCC climbing. That being said, there is still extensive analysis needed that considers dispersed recreation in this Alternative.	Ben Christensen	Website
5339	I support the plan that uses gondolas to move people in Little Cottonwood Canyon.	William Nissen	Website
5340	I support the gondola option. I think the gondola would be an excellent addition to the canyon and help preserve it for generations to come	Justin Bagley	Website
5341	I have worked on transportation possibilities in LCC for 30 years. The LaCaille option being proposed looks real good. The original UDOT gondola proposal was good and is far better than more buses and a bigger road. Either your gondola proposal or the LaCaille option would seemingly be best studied with the highest capacity Gondola technology available much easier to reduce capacity than try and gain it later.	Onno Wieringa	Website
5342	Bouldering areas in little cottonwood, though free to the public, have just as much value to our community as ski areas. Please consider saving these areas during your decision making process. As a climber I vote on whatever alternative does not impact and destroy those important areas such as: secret garden, cabbage patch, 5 mile, the hill are all classic areas with history to be protected. I vote against any lane widening that will impact the bouldering and climbing sites. Thank you for your consideration, Dr. Carrie Cooper	Carrie Cooper	Website
5343	I think the gondola with a Parking structure would be the best idea, the traffic is horrible and the gondola would be the best idea	Matthew Lund	Website
5344	I think a gondola would be great	Cameron Falkenburg	Website
5345	I am in favor of expanding the road and improving bus transport. a gondola is a bad idea	Erik Misiak	Website
5346	I support enhanced bus service and no road widening. I am concerned about losing our rock climbing and road-side boudering resources that make LCC a world class climbing destination. The simplest and least intrusive solutions are the best. Pedestrian and roadside parking issues in the canyon can be solved by reduced and enforced speed limits. We really have a simple problem- too many people trying to get to Alta and Snowbird on powder days. Other businesses have to limit customers and so should they. We are all suffering through this process that is quite simple. Make skiers to Alta and Snowbird bus to the resorts. Leave LCC 201 and Wasatch drive alone.	Bradley Heller	Website
5347	I support Enhanced Bus Alternative (without roadway widening). This will help until we really address the problem of too many cars and people in the canyon. Some kind of tolling like Milcreek Canyon would greatly help.	Joel Bown	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5348	<p>First off, thank you for accepting comments and I appreciate you taking the time to review them.</p> <p>I think solving parking near the base of the canyon(s) will be the most crucial step for any plan. If this isn't dealt with, neither a gondola nor buses will help the problem. Given this is adequately dealt with, I can see the buses (and carpooling) being a much more viable option for people not currently utilizing them. Certainly I'd think expanding parking capabilities and increasing buses (with trailhead stops) would be cheaper and more logical than jumping right into something as invasive and needlessly extravagant as a giant gondola that serves nothing but the financial interests of the tourism industry and resorts. Not to completely dismiss those important needs, but keep in mind that all the resort season pass holders are locals. Locals who use these canyons every day in winter and summer. Locals that both ski the resorts and want to access the trailheads up the canyon, which the gondola would not provide. Locals who may in fact live in Utah and contribute to its greater economy and its culture specifically because of the access they have to these canyons. Ignoring their needs so Ski Utah can tout "North America's largest gondola" in advertisements would be ill-advised.</p> <p>The lane widening plan also makes much more sense to me than the gondola. And then benefits of potentially using it as a bike lane in the summer makes it that much more attractive. However I'm also slightly concerned about the environmental and recreational impact that work will have. This is my main concern with both the lane widening and gondola plans. The construction and infrastructure will disrupt, diminish, or permanently destroy some recreational resources in the canyon such as a large amount of rock climbing, hiking, and a general sense of nature that's already difficult to maintain with the road there.</p> <p>Buses aren't being utilized currently because of 2 main reasons that I see. There's not enough parking. People may be willing to take the ski bus, but they are likely not willing to park away from the canyon and possibly transfer buses to get to one. I myself have never done great deciphering bus routes. More clarity as to where you can go and when to grab a bus to Alta would help a lot, but the more parking closer to the canyons the better. Secondly, there's not enough bus service. No one wants to wake up at 7am and wait helplessly at a bus stop, instead of joining the race to get up canyon, only to find out that bus is full or is still 30 minutes out. The buses also don't stop at backcountry trailheads. This user group is already very happy to carpool from park n rides, but they're also taking up a lot of parking before the resort traffic really even gets going and is often driving down canyon at the same time as the resort traffic. Give this user group a viable and reliable option to get up and down from their trailheads and they'll absolutely use it. Understand people don't want to risk waiting outside in a storm with no car of their own in hopes a bus will "eventually" come.</p> <p>Also just to mention it, the massive delays in getting up and down canyons on snowy days are absolutely due to ill-equipped drivers attempting to get up on a storm day. Tourists have a limited schedule, they're not going to miss out a great day of skiing. Locals live here exactly for these days. People are going to drive, whether they are prepared for it or not. We really need a plan to turn people away at the bases if their vehicles are not equipped and provide them a real alternative. I know this alone creates a delay, but a worthy one and hopefully a much shorter one than a slide off at Tanners. I know this will create back ups out on Wasatch Blvd. We'd need to account for those issues, but it's worth considering for safety if nothing else.</p>	Kenneth Meleta	Website
5349	Hello - I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	Gregory Cetton	Website
5350	The gondola option looks like the best. Thanks	Jon Murray	Website
5351	I fully support the Little Cottonwood Canyon Gondola Alternative.	Gordon Strachan	Website
5352	Gondola please	Jon Murray	Website
5353	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	Kellie Gerbers	Website
5354	<p>Dear Utah Department of Transportation,</p> <p>My name is Sarah. I am a pediatric nurse who came to Utah because of the beautiful Wasatch Mountains, specifically the Cottonwood Canyons. I regularly recreate outdoors as a trail runner and in bounds and backcountry skier who frequently travels up Little Cottonwood Canyon. Because of this, I agree that changes need to be made to diminish traffic.</p> <p>Because I desire to do as little harm as possible to our canyons, I support enhanced busing with no widening of Highway 210. I think this is the best option to decrease traffic if coupled with improved parking options at bus stops. I believe the transit system should have many pick up locations around the valley so that people can access it near where they live. Furthermore, I would like to see the use of low or zero emission buses and vans on the current LCC road with no, or minimal, additional construction.</p> <p>This option has the lowest environmental impact, which I believe should be the most important point in our decision making process for a project in a watershed area. Plus, it is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. Enhanced busing is also the most convenient option for the largest number of people while also being the least expensive per the EIS (as Michael Scott would say, a win win win.)</p> <p>I do not support the proposed ideas of expanding the road or installing (and maintaining) a gondola. This is because it will have a much greater environmental footprint. Additionally, it has been pointed out that buses and vans are a year round solution since they can be used as transportation to trailheads in all seasons, serving dispersed users such as hikers, bikers, fishers, and backcountry skiers.</p> <p>In contrast, a gondola will not be able to serve people outside of designated stop areas. This is challenging for backcountry skiers wanting to access other trailheads and would decrease the number of users willing to use it. In turn, more people will continue to travel by car in the canyons.</p> <p>As an avid outdoor adventurer, I go to the LCC because of the connection to nature and the mountains. I beg you to continue to protect the LCC by seriously considering the impact that each of the options will have on the environment. I believe enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Thank you for the opportunity to share my opinion on the LCC Environmental Impact Statement.</p> <p>Sincerely, Ms. Sarah McCroy</p>	Sarah McCroy	Email
5355	<p>I'm 75 years old, an east coaster and have skied Little Cottonwood Canyon since 1969 (at least 30 annual visits of a week or more, plus many shorter visits). I've stayed downtown, near the base of the drive up the canyon, and at Snowbird or at places like Sugar Plum. Modes of transportation have included the UTA bus or driving all the way up and have experienced easy and horrible driving conditions and complete road closures. And, of course, the long lines that often occur.</p> <p>I've also followed the many ideas that have been explored for making the trip up easier, safer and more predictable.</p> <p>That said, the idea being proposed of a gondola coupled to the resorts with a significant parking structure at the La Caille base station (The Gondola Plus La Caille Base Station proposal) makes a lot of sense from 1) cost of execution, 2) convenience of use, 3) speed of conveyance and 4) predictability. It is far more preferable and convenient than using more remote UTA parking locations and then the extra step of busing to the gondola base station. I would gladly take the Gondola Plus La Caille Base Station option versus the unpredictable drive up, inconvenience of parking far from the lifts, and minor increase of time in the best of circumstances. I hope that this proposed approach will be adopted.</p>	Jeff Isreeli	Website
5356	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	Karthik Sonty	Website
5357	This will severely impact recreation in the canyon, specifically rock climbing. UDOT has an obligation and responsibility to all residents and visitors to protect recreation throughout the canyon. I absolutely oppose these measures.	Michaela Kiersch	Website
5358	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Sincerely, Ms. Jans Wager</p>	Jans Wager	Email
5359	I am in favor of the Gondola Plus La Caille Base Station	Leah Kolb	Website
5360	ALTERNATIVE La Caille base station option. This is the one Snowbird and Alta support. It has parking at the base of the canyon. it's the only way to actually get cars off of the road. https://gondolaworks.com/	Daniel Saunders	Website
5361	I support the Gondola initiative to alleviate traffic in LCC, this seems like the most effective long term solution to alleviate traffic in LCC. Widening lanes will only support more vehicle traffic where a Gondola will provide alternative transit which can eliminate the need for cars. Skiers and riders are also used to taking gondolas and trams so this will be an easy pill to swallow vs additional busses.	Sam Watkinson	Website
5362	I support the Enhanced Bus Alternative (without roadway widening) but would still recommend extensive analysis that is needed to consider dispersed recreation in this Alternative. Thank you	Adriana Chavez	Website
5363	<p>I think the best of the 3 options is the Enhanced Bus with NO additional roadway capacity. This option is the most mindful and inclusive of other recreations besides skiing. Although the gondola would minimally impact recreation spots like bouldering and trails near the roadway, it is significantly more expensive and provides slower access to the resorts. A challenge with busses can be encouraging the use of them, it may be prudent to have increased busses during the winter months and reduce them during the spring/summer/fall when the majority of the activities are dispersive rather than localized at a resort.</p> <p>Overall, I feel strongly that widening the road will be much too expensive and have a very negative impact on other activities that drive a significant portion of the use in little cottonwood.</p>	Sarah Lefave	Website
5364	<p>While a definite improvement over the UDOT idea of a huge parking lot at the base of Little Cottonwood Canyon, I don't love the idea of the beautiful La Caille property being used for this purpose. What's the fate of it during the 8 months of the year when ski crowds are gone? Also: #1 I've seen no information on how the gondola would perform in the frequent high winds in the canyons. #2 How would you address the dangers of Covid exposure (and flu exposure) from people you don't know in the confined area of a gondola? #3 Who pays for this project? As a skier and resident on Little Cottonwood Road for 45 years I think those of us most greatly affected need lots more information and better drawings of what you propose. Thank you.</p>	Anne Benck	Email

5366	<p>Gondola option. People who complain that the gondola only serves the resorts are forgetting that they can still take a bus up the canyon, or drive, and the gondola will eliminate traffic for them. Gondola option is a no brainer.</p>	Nathan Hofmeister	Website
5367	<p>Based on visual, environmental and other impacts to recreation in the lower part of the canyons it is a terrible idea to put in a tram where there are clearly other lower impact viable options, specifically increase The bussing. Furthermore, it is not equitable to impact the residents and other users of the lower canyon to simply serve the needs of privately held ski corporations that already reap massive financial benefits through the use of public lands. Buses are the clear solution as they are the easiest and cheapest to implement and could be deployed immediately, don't negatively impact both the residents and users of the lower canyon, and don't create a huge eyesore that will ruin the natural beauty of the entire canyon.</p>	Mike Beck	Website
5368	<p>I submitted a comment earlier in support of the gondola but wanted to clarify. The only way to actually get cars off of the road is the 3rd party ALTERNATIVE La Caille base station option. It has parking at the base of the canyon. The other options won't help the problem</p>	Patrick Duke	Website
5369	<p>Gondola option - could also be a great tourist attraction in the other seasons.</p>	MAXINE JENSEN	Website
5370	<p>I know SLCA has commented, but I also want to bring awareness to the climbers that use LCC and raise concerns about access to climbing areas! It's a land of many uses, and I have concerns that my specific use will be left out of this plan. Thanks for the invitation for comments and thanks for your time!</p>	Lindsey Kaneko	Website
5371	<p>I would love to see a gondola option with extended bus transport to the base of the gondola. The most appealing factor for the gondola option is the reduction of air pollution in the canyons. I really hope to see this implemented.</p>	Stefanie Schulz	Website
5372	<p>I currently support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing, and backcountry access. That being said, there is still extensive analysis needed that considers dispersed recreation in this Alternative</p>	Chad Christensen	Website

5380	<p>I have lived in Utah 51 years and treasure the Wasatch canyons, even though I no longer ski. For many years, they were a retreat from summer heat, a delight during fall color, a winter recreation area for various snow sports, and always a place to enjoy magnificent mountain and forest scenery.</p> <p>I dread to think of what damage the "improvements" proposed by UDOT will bring. These changes will be destructive and irreversible. I therefore adopt and incorporate by reference all of the Comments of Save Our Canyons on the EIS.</p>	Susan Poulter	Email
5381	<p>Please consider what we are leaving for those who follow us, and preserve the best, rather than serving commercial, short-term purposes.</p> <p>I have only been caught in LCC ski traffic a couple of times. But all of the benefits in terms of reduced congestion, increased safety, and reduced pollution stack up to make the gondola the best option for reducing and managing traffic in LCC. We have a very unique opportunity and I would love to see us take advantage of it. Let's avoid becoming the next Denver, which has notoriously bad traffic and has tried the bus solution, to not much benefit.</p> <p>Thank you</p>	Aaron Bender	Website
5382	<p>I am in support of the LCC gondola option. I see the potential reduction in vehicle emissions as the biggest advantage of the gondola.</p>	Jeff Carroll	Website
5383	<p>Personally, I like the idea of enhanced bus service. Widening the road is expensive and disruptive and the gondola turns the whole canyon into a "Disneyland" like attraction. It may be that a reservation system will have to be put in place, as much as I dislike it. If I know that I'm going to hike White Pine next Saturday it's not a big deal to go online and reserve a day. Just my 2 cents.</p>	Rich Sheya	Website

5384	<p>Dear Utah Department of Transportation,</p> <p>I do not support any transportation solution until a carrying capacity study is conducted. Skier experience is currently being degraded by having to sit in your car for hours to get to and from ski area destinations. However, increasing transportation capacity could easily overwhelm the crown jewel of Utah (Little Cottonwood Canyon) and shift congestion from the roads to the ski areas. Hours long lift lines will surely turn customers away just as much (maybe more?) than a long commute. A carrying capacity study in the EIS should survey users to ensure they understand this trade-off and decide which they would prefer (traffic on the road or long lift lines).</p> <p>After carrying capacity study, I support expanded bus service without widening the road. Busses are flexible (can increase and decrease according to demand). They could be given early morning priority to incentivize ridership.</p> <p>I support the addition of snow sheds to reduce risks to users who are stuck in traffic during high avalanche danger.</p> <p>I support all trailhead expansions. These appear reasonable and much safer.</p> <p>I support Tolling (which many ski areas have already started on their own!). Tolling will reduce the number of single-occupancy vehicles. Combined with frequent, economical busses, the carrying capacity would be served. I would like to see a tolling study in the EIS and it's impacts on canyon congestion.</p> <p>I strongly oppose the gondola solution. In every scenario I imagine, users will be greatly inconvenienced. The 'powder frenzy' to get up the canyon will be shifted to getting into parking spots for the transit hubs, then a lift line for the gondola! People's overwhelming excitement will be diminished quickly and they will resort to their vehicles. And, in the end, without a carrying capacity study, the lift lines will greatly discourage users at our ski destinations. The gondola also requires a stop at Snowbird, which will disincentivize Alta skiers. It does not serve any trailheads.</p> <p>The proposed solutions also need to address dispersed users. The whitepine trailhead is currently overrun for such a vast area of terrain it serves (with people regularly parking on the roadway) and busing would need to include stops at this trailhead (and other trailheads) if requested by riders.</p> <p>Final thought is convenience. As an Alta skier and a backcountry skier, I cannot—under any circumstance—envision myself using the gondola. It would be a major inconvenience to get in my car, drive to a hub, wait in a long-and-powder-panicked line to get into a parking spot, wait in a powder-panicked line to get on a bus, wait in a powder-panicked line to get on the gondola, AND waiting in powder-panic for Snowbird users to get off the gondola. Then, at the resort, I won't have a car to store my extra clothes and food, so I'll have to push my way through crowds competing for lockers... And only then, would I get to line up in a 2 hour lift line (still in powder-panic)! Not good. While this opinion is clearly selfish, I propose this opinion for consideration because I believe I am not the only person who would do this calculus. An EIS should study user behaviors and survey them on these scenarios in order to understand user sentiment and behavior to optimize a much-needed solution.</p> <p>Thank you for such a daunting undertaking. This is not an easy problem to solve!</p> <p>Best Regards, Austin Bourret</p> <p>Sincerely, mr. Austin Bourret</p>	Austin Bourret	Email
5385	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC rock climbing.	Jessica Donigan	Website
5386	If we simply invested less than a quarter than is being proposed in some of these options, \$50 million to \$100 million in buses, transitioning 50-70% of the people out of their vehicles and onto transit well before the mouths of the canyons; if we altered behaviors by not allowing cars to line up, implemented a toll that encouraged 4 people per vehicle, ticketed vehicles for having ill equipped tires, and enforced no roadside parking as should have been done years ago -- we could make a bigger dent in the dreadful traffic woes caused by cars and would have to build nothing more in our canyons.	Marcus Hall	Website
5387	As a davis county resident and frequent summer visitor (vehicle driven) of the cottonwood canyons, I would love the opportunity to park my car and take a gondola to the resorts rather than driving.	Michael Hopkins	Website
5388	As a climber and backcountry skier I strongly feel that the Enhanced Bus alternative is the best option of the 3 proposed. Climbers need parking low in the canyon and this option least disrupts my access. Thanks! I personally think that the best option to reduce traffic and reduce the overall impact on the canyons will be the gondola option.	Patrick Wilson	Website
5389	<p>I also want to make sure that the gondola option won't negatively affect backcountry recreationists such as backcountry skiers and rock climbers.</p> <p>I think this will be less impactful because:</p> <p>1 - It has the least amount of impact sites. This number is equal to the impact sites from the enhanced bus option without the road widening, but the impact sites for the gondola are much smaller and will thus have less impact on the surrounding environment.</p> <p>2- People get excited about riding gondolas. My biggest worry about focusing the solution on busses is that people generally don't think of busses as a fast transportation option. Even though the busses would technically get you to the resort faster, I feel that more people will choose to ride the gondola if it is an option. This will greatly reduce the amount of traffic in the canyons.</p> <p>Thank you, Cody Porter</p>	Cody Porter	Website
5390	As a climber and backcountry skier I strongly feel that the Enhanced Bus alternative is the best option of the 3 proposed. Climbers need parking low in the canyon and this option least disrupts my access. Thanks!	Patrick Wilson	Website
5391	As a regular recreation user of lcc I want to advocate for improved bus services without road widening.	Brittany Bickley	Website
5392	I think the gondola is a great idea. Less pollution and a tourist attraction in itself. Would like to see a combination of more buses in the near future and a gondola as soon as it can be built.	Nicola Nelson	Website
5393	<p>Dear Sir, Thank you for this study. Clearly the goals that UDOT uses for this decision both agrees and also disagrees with community and local government goals. UDOT's goal to meet the growth of automobile use is not a community goal.</p> <p>This proposal would encourage an increase in automobile numbers in the canyons. Yes, some alternative modes of travel are offered but they do not significantly reduce total automobile numbers. One reason is that UDOT does not really believe in safety as a goal. Bus travel is ten times safer than a private car. If safety was a main goal, then UDOT would be promoting transit as the major mover of people in peak times.</p> <p>Behind the scenes, there is an effort to widen roads. UDOT wants to increase the shoulder on most roads including those inside the canyons. This will amount to major bare exposed soil faces both unstable and a sight in conflict with canyon quality goals. I would not expand shoulders. Nor would I widen the roads which increases average driving speed. Narrow and slower roads are safer, based on analysis on state HW 12 and UDOT's proposal to increase shoulder width.</p> <p>Adding more lanes encourages increased auto use. Based on UoU's experience, increased access to the campus was achieved by reducing auto use. Auto use was regulated by controlling parking. Parking management is the key to controlling vehicle flow numbers in the canyon. The goal should be to limit auto use not to increase the level of service quality. Decisions that promote travel times and level service criteria fail in this situation and are inappropriate.</p> <p>This plan fails to integrate vehicle use with the ski areas. Working with the ski areas, any car travelling in the canyon needs to have a reserved parking permit to enter the canyon. If you don't have one, you have to go to a transit center and take the bus.</p> <p>One of the key problems with bus use is ski equipment. The solution is to work with ski areas to have reduced-rate ski equipment rentals at the resort. The bus passenger would arrive at the ski area, rent equipment, and, at the end of the day, return the equipment.</p> <p>Other options that involve rail or cableway modes of travel are problematic for this canyon. The long term solution needs to focus on most trips coming by light rail to the mouth of the canyon and then bus to the resorts. Car use should be limited to about half of what it now is.</p> <p>No mention is made of air quality issues. This is an issue masked by DAQ and ignored by UDOT. The cumulative air emissions need to be reduced to a level that makes it healthy to breath. With population growth and VMT growth higher than the population growth rate, air quality will be significant worse in serious inversions. This administration has ended the increased tail pipe emission reduction that we counted on to reduce pollution. With that in mind, new analysis is needed to plan a total system that reduces VMT in the air shed to a level that ensures the air is healthy to breath. We have become complacent during the past few years without serious inversions. We should not count on that in the future. Please let me know how these comments were considered, and how I can see the final document.</p> <p>Thanks, Jim Catlin</p>	James Catlin	Website
5394	I think it would make the most sense to enhance the bus service in Little Cottonwood Canyon to have very frequent potential bus stops all the way up the canyon. I go up there up to every 2 weeks year round to hike, ski, snowshoe, etc and I think I'd love it if there were more bus stops along the way up, maybe every 1/4 or 1/2 mile people can get on and off at different places for different climbing routes, hiking spots, etc. I don't think a gondola would help me and many others with the way we recreate. I don't always go to the top of the canyon. I go all over the place. I'd love to see traffic decreased and larger parking lots at the bottom of the canyon. I know it's a complex problem, but I think that having frequent bus stops would help a lot. I currently don't use the buses because they don't stop often enough, and I try to avoid peak days up there because it gets so crowded with car traffic.	Mara Green	Website
5395	I just want to say that losing ANY access, let alone a single boulder or approach, is so absurd and sad that I am unable to believe it. We have world-class granite climbing routes and boulder problems in our back yard that bring people from around the world here! Do not let this happened, please, there is a solution for both!	Lance Osborne	Website
5396	<p>We need to minimize impact on the canyon, as well as traffic/pollution. I believe that we need to encourage public transportation without widening roads.</p> <p>As a CWH resident, I would like to see the least amount of impact and traffic in my area. I am in support of imbalanced lanes and a gondola to help combat the traffic problem, but also minimize the environmental impact in the future.</p> <p>Even if SR210 were expanded to accommodate more traffic, it would still be impacted with avalanche control, which is one of the main reasons that traffic gets backed up. We need to be looking into long term effects of the canyon and the environment.</p>	Stephanie Shew	Website
5397	I go up Little Cottonwood 5 days a week and I support the gondola.	Paul Winter	Website
5398	For the sake of those of us who recreate in the lower canyon, and for the sake of the environment, please do NOT consider a tram! More bussing is the clear, cost effective solution.	Chandler Rosenberg	Website
5399	Hello. I support a widened road, with a flex lane that is ONLY ACCESSIBLE for mass transit / buses. Along with increased bus service, and more parking below the mouth of the canyon.	Brady Larsen	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	Please support the BEST OPTION for Little Cottonwood canyon: GONDOLA PLUS LA CAILLE BASE STATION.		
5400	It may offer better mobility, smaller environmental impact, better air quality, fewer cars, etc. Bigger roads is only a temporary solution that doesn't address the root of the problem: long term growth up the canyon. An alternative to cars offers the greatest number of options for long term growth.	Michael Alley	Website
5401	I support the Gondola option with the La Caille base station	Newel white	Website
5402	I firmly believe the Gondola is the best option. I am an employee of Snowbird, and as much as I would hate to see the canyon get developed more, one of these options is inevitable given the time we are in. A Gondola would eliminate unnecessary traffic, decrease automobile accidents, and be the most environmentally friendly option. Increasing amount of Car traffic creates a further strain on UDOT avalanche control work, parking, and air quality in salt lake. Additionally, it could be run on sustainable energy, rather than our dependence on fossil fuels and cars. Finally, a gondola would provide a safer way for me to commute to work, where I already put myself in harms way performing avalanche control work. Thank you for considering the public's input!	Weston Keith	Website
5403	I support increased buses running in Little Cottonwood. Please DO NOT widen the road or build a gondola. These would have a negative impact on the already stressed environment.	Tyler Bench	Website
5404	Is doing nothing at all an option? There is plenty of precedent in Utah for increasing road capacity to only have that capacity gobbled up by increased development and use such that 5 years later you are talking about widening and building even more. I like the idea that the peak periods for winter use are a disaster on the roads. It spreads people out or they don't come in the first place. It seems like these improvements are really just a big state-sponsored gift to the ski areas. If the ski areas want this stuff, they can pay for it. If one of these proposals is inevitable, I would definitely choose to enhanced bus with no widening option.	Matt Jeglum	Website
5405	Gondola seems best.	Jordan Seldin	Website
5406	Of these three options given, I strongly prefer the Enhanced Bus Alternative (without roadway widening). Many of the popular climbing spots in Little Cottonwood Canyon are right alongside the road, and we need to protect them.	Kira Parker	Website
	From reading through all of the options, and seeing benefits vs. cost vs. chaos, it seems that adding more Buses without enhancing the roadway would yield the most benefit for the cost.		
5407	Really, I think that a toll or an annual pass and dollars devoted to officers checking tires would be an even better way to alleviate congestion in the Winter months, which is the largest chunk of traffic issues. Thanks for listening. Jason Fox	Jason Fox	Email
5408	The thought of building a gondola up Little Cottonwood Canyon makes me sick to my stomach, as does the notion of expanding the road significantly. Recreation in the form of climbing, hiking, observing wildlife, etc., exists within close proximity of the road and I do not want to see that heavily impacted. Please go with the least impactful option, which can be implemented immediately, to expand bussing instead of the other highly invasive options (road expansion and gondola). Thanks.	Lauren Callaway	Website
5409	I support the increased bussing option without widening the road. I do not support the gondola.	Melody Sieverts	Website
5410	I side with SKI UTAH and Alta Ski Resort and believe that the Gondola Plus the La Caille Base Station is the most holistic option to protect the canyon's pristine beauty for future generations.	David Malmborg	Website
5411	The proposed addition of large parking structures, addition buses and the gondola is a great idea.	Nicholas Clark	Website
5412	It pleases me to see all sides working together on this project , great job and stay focused, through that a solution will arise.	Dean Civile	Website
5413	My son, who spent 10 years traveling the Canyon, actually did his college thesis on constructing a gondola in Little Cottonwood Canyon and that was 5 years again. Traffic has increase greatly since then. I can't imagine a better solution.	Tauni Powers	Website
5414	I find that the Enhanced Bus Alternative (without roadway widening) is the only option that considers dispersed recreation, especially with the current pandemic, these activities should have as strong of a hold as our ski resorts do.	Grant Burton	Website
5415	I am strongly in favor of the gondola option. No pollution in the Canyon. Quiet. Constant loading and unloading not waiting for a bus. Much More pleasant experience than a bus. Loading and unloading is easier. My only concern is how it would work for Back Country Skiers and Hikers that want to access other areas of the Canyon than ski resorts.	Merritt Norton	Website
5416	There needs to be a big bold plan for the future. Adding more buses just seems to be a band-aid to the problem of congestion in the Canyon. Moving toward a gondola solution is going the right direction of solving issues in the LCC long term.	Tim Hendrickson	Website
5417	I strongly believe that the EIS as currently constituted completely fails the Wasatch and its happy users. The Gondola will not reduce traffic. Widening roads will not reduce traffic. Parking lots won't reduce traffic (because they invite MORE cars), while fundamentally and permanently damaging the Wasatch environment--which is the value that attracts people to the area. The best solution is a better supported and a better planned bus system. UTA is the right entity to fund and to work with in these efforts.	Michael Peck	Website
5418	I support the enhanced bus service without road widening in LCC to minimize environmental impact in the canyon. I am an avid climber, skier, and hiker and spend time in LCC every week of the year with my family. Roadway widening would be devastating to the world-renowned, irreplaceable climbing in LCC. This is a natural treasure that is vital to our community and needs to be protected.	Cheryl Pirozzi	Website
5419	I'm a passionate, lifelong LC skier. And I want to preserve it for the generations to come. I support the Gondola option. It seems to be the best option moving forward.	Parker Dunn	Website
	Dear Utah Department of Transportation, I'm writing to let you know that I have thoroughly considered the proposal options and support the Wasatch Backcountry Alliance's conclusion that enhanced busing without road expansion is by far the best solution for the canyon, for the public, for resort and backcountry users, and for the expense. Not only would a gondola be wildly expensive and have a significant environmental footprint (as well as serving as an eyesore and viewshed disruption), but I'm certain that it will be more of a novelty item than an effective and efficient transportation solution. I'm certain that the resorts up the canyon have a biased opinion--a gondola is a fun marketing talking point. But it is NOT the most efficient, environmentally friendly, and FAST transit solution. A gondola also leaves out a large number of backcountry users who would have stopped at trailheads and thus need to just take their cars.		
5420	I've heard that the gondola would operate in the winter only, thus not alleviating summer traffic concerns. And if it operates during resort traffic hours only, it fails to serve the public who would have gone up early in the morning or evening (which includes a large number of backcountry users). I beg you to consider the lasting environmental ramifications at stake and, instead, offer a low-cost, schedule-enhanced bus system with a great transit hub people can park at and hop onto the next bus. This will serve resort skiers and backcountry skiers as well--and anyone who wants to visit our beautiful canyons. It's the simplest solution, the best value, and the fastest to implement. As someone who spends considerable money at our local resorts and a large amount of time in our backcountry as well, I'm considering the issue from all angles and have researched and contemplated it. Thank you for your consideration. Sincerely, Ms. Beth Lopez	Beth Lopez	Email
5421	Bussing is the only acceptable solution! A tram will have too many negative impacts on the environment, residents and those who recreate in the lower canyon. Please don't make the mistake of adding a tram. More buses is the best solution.	Tommy Rigby	Website
5422	Hi, I would like to submit my support for the Bussing alternative without the widening of roads as it seems to offer the least impact on the wildlife in the area. It seems to be a fairly good solution for Zion NPS. Thank you!	Sarah Schlaefke	Website
5423	I support the enhanced bus option for LCC. As a Snowbird skier, climber and hiker I feel this option will be sufficient in keeping the traffic down (I ride the bus whenever possible) and most importantly has the least environmental impact. Widening the road or adding a gondola will destroy valuable parts of the canyon- parts we will not be able to get back. I support keeping the canyon as wild as possible and the added buses are the best option for this.	Lendy Gillespie	Website
5424	I support the gondola project & preserving the canyon and wilderness. I do not think the other 2 options proposed will really fix the issue, and would cause more problems than the gondola project.	Amanda Punzalan	Website
	As Executive Director of FRIENDS of Great Salt Lake, I am respectfully submitting the following comments on the Little Cottonwood Canyon project. FRIENDS of Great Salt Lake is a membership nonprofit organization whose mission is to preserve and protect the Great Salt Lake Ecosystem through education, research, advocacy, and the arts. The long term vision of FRIENDS is to achieve comprehensive watershed-based restoration and protection for the Great Salt Lake Ecosystem. With these principles in mind our concerns with how we responsibly address transportation impacts from our growing population in the Great Salt Lake watershed are of paramount importance to the extraordinary values inherent in the Wasatch Mountains and its National Forests - not just as a contributor of important inflows to the Lake but to our quality of life as well. Thank you for your consideration of these comments. In saline, Lynn de Freitas, Executive Director		
	One of these proposals stands out as particularly destructive to the watershed and viewshed and recreation of the canyon. The proposed gondola up Little Cottonwood Canyon would do little to solve the transportation problems facing the area and would only encourage more drivers, which is what has caused this problem in the first place. As proposed, the gondola will require two transfers, from car to bus to gondola which will be logistically problematic. The plan identifies a 2,500 car parking garage at the mouth of Big Cottonwood canyon. This will cause a few problems. First, anyone driving from south of the canyons will need to drive past Little Cottonwood (presumably in traffic) to park in the garage. If they are coming from the north, they will still need to line up to enter the massive parking structure. Then both groups will need to catch a bus to the base station and then transfer to the gondola. Not only does this plan create a logistical nightmare at the base of the canyons, but it puts way too much emphasis on vehicular travel. Encouraging automobile travel is the opposite of what we need in our canyons. We need to have viable alternatives to personal vehicles. The fact is that although these ski resorts are in beautiful mountain terrain, they are at the edge of a major city and need city transportation solutions.		
5425	This plan spends hundreds of millions of dollars (\$400 Million for the gondola) and doesn't do anything to solve issues in Big Cottonwood Canyon. Big Cottonwood may not have as much traffic as Little Cottonwood, but it is not far behind. We need a plan that addresses transportation issues in both canyons. In fact the 2500 car parking garage for the gondola up Little Cottonwood will be placed at the mouth of Big cottonwood canyon several miles away increasing traffic to get into Big Cottonwood. The gondola plan endangers important sites for other uses in the canyon. The base of little cottonwood canyon is home to some of the greatest rock climbing in the world. People move from all over the world to live in SLC for that climbing, the base station for the gondola will destroy many of the boulders that climbers use and will possibly hurt access to many of the cliffs. It also doesn't identify what will happen to backcountry users. Will non-resort users be allowed in the canyon? The gondola won't be stopping anywhere except Snowbird and Alta. Backcountry skiers, snowshoers, and hikers are completely ignored in this plan. The bases of the gondola will require significant construction throughout the canyon, it will also permanently change the watershed and viewshed of the canyon. 800 foot tall towers will forever be a part of the canyon views. All for a gondola that will likely only be operating for 3 or 4 months of the year. There are alternative options. UDOT seems to have made the bus plans in its proposals an afterthought. But, unlike a gondola they can be enhanced over time. UTA already has a robust transit system throughout the valley, we can run Bus Rapid Transit like vehicles from locations throughout the valley directly to the resorts. Allow backcountry users to use the bus by having stops mid canyon. And create tolls for Little Cottonwood in the winter so that people are encouraged to take the bus but can drive to backcountry locations if they need to. In Salt Lake City we are blessed with amazing National Forests right at our doorsteps. These mountains provide us with clean water and endless recreation. Let's not cave to corporate skiing interests that would change them forever.	Lynn de Freitas	Website

5426	I would support better bus-based transit options. I am opposed to the gondola which is expensive, has capacity issues and won't solve many of the congestion problems. Plus, where are all the people going to park?	Hal Crimmel	Website
5427	I've been hiking around and rock climbing in Little Cottonwood canyon for the past 25 years! Nothing beats hiking through the pines while gazing at the beautiful granite formations and blue sky. It's a place where I go to decompress and reflect. To think that it could be compromised for the almighty dollar makes me sick!.... and for what?! So tourists can make it to the ski resorts easier? What about all the locals who have lived here our entire lives? The tram would be a giant eyesore and Constant reminder that profit over rules compassion. The people that use this canyon on a daily basis do not want to have the views ruined by this metal garbage covered in logos and advertising! keep the tourists in Park city! Please don't ruin Little Cottonwood Canyon! I ski every season and never find any issues getting to the resorts! There's no reason to exploit something so beautiful! PLEASE IM BEGGING YOU FROM THE BOTTOM OF MY HEART!!! PLEASE SAY NO TO THE SKI TRAM!	Bryce Johnson	Website
5428	Please see comments from Mike Marker/Craig Osterloh...I unite with them and the general comments from the Little Cottonwood neighborhood community.	Scott Whipperman	Website
5429	As someone who lives near Wasatch Drive, I'm unenthusiastic about broadening it. As someone who hikes in the canyons, I'm unenthusiastic about a gondola, which I hear is being talked about. And as someone who tracks the progress of climate change, I'm not sure we should be building infrastructure to support an industry that won't exist in a few years.	Elijah Millgram	Website
5430	Thank you for allowing the public to provide input on the proposed changes to the Little Cottonwood EIS. As a skier, hiker, and climber who frequents the canyon I want to provide my perspective. There is no doubt that transportation in Little Cottonwood canyon is an issue on some days, mainly weekends and storm days. That being said, I think several issues should be taken into account before making sweeping changes that may only be useful for a small fraction of the year. Little Cottonwood Canyon is a gem, one of the most beautiful canyons in the state. Putting a gondola through the canyon would forever alter the viewshed, with many large towers stationed throughout the canyon. This needs to be strongly considered and weighed against the positive impacts of having a gondola. My main concern however lies with roadway widening proposals. The intent to reduce or eliminate roadside parking will have wide-ranging effects on a variety of recreational user groups. Many world-class backcountry skiing, bouldering, and rock climbing destinations exist all over the canyon, scattered liberally all the way from the park and ride to grizzly gulch in Alta. Any parking restrictions must be carefully tailored to avoid restricting access to these special places. I hope that the Salt Lake Climbers Alliance will be consulted for advice on how to avoid reducing access to these amazing opportunities within our national forest. Little Cottonwood is a world-class bouldering area, with a long and rich climbing history. Many of the world's greatest climbers have come here to test themselves on the pristine granite boulders that scatter the canyon floor. Many of these boulders lie quite close to the existing roadway; thus I am worried that widening the road may result in the destruction of some of these boulders. I think this should definitely be taken into account if the widening of the roadway does occur. These boulders are a treasure to both local climbers and visiting climbers and it would be a shame for future generations to miss out on the amazing bouldering opportunities that we have enjoyed there for so many years. Once again I thank you for the chance to offer my input and sincerely hope that a decision is made that both improves the congestion and avalanche control problems on the road and does not hurt non-resort skiing user groups. -John Pikus	John Pikus	Website
5431	I support the construction of the Gondola with the La CAILLE base station. Furthermore I support tolling all private vehicles in LCC with exceptions for staff and residents. I believe the Gondola will allow for decreased traffic, decreased pollution in the canyon, and increased sustainability of winter activities.	James Hunter	Website
5432	Gondola	MIKE BARNARD	Website
5433	UDOT needs to prioritize safety above speed and capacity. Validate local access concerns such as: • Local traffic turns in and out of eleven residential streets during heaviest ski and commuter traffic periods. • Provide safe access up to federal guidelines for all users that are expected to utilize this residential stretch of Wasatch Blvd including bicycles, pedestrian, park going people, kids going to school, etc. They have been forgotten while UDOT tries to make improvements for better access for ski traffic and commuters. • Three-lane configuration is still the best model. If busses will travel without stopping from the Gravel Pit mobility hub (skiers) or 9400 South & Highland (commuters) to a destination outside the urban segment of Wasatch Blvd, then they do not need to travel in the shoulders (where they would be needed if they were to pick up passengers within our city). UDOT/UTA have already confirmed that Express Bus service to each resort is requisite. Likewise, it is necessary that UTA implement Express Bus service for commuters heading to Research Park, U of U and downtown. Since most recreation and commuter travel is unidirectional, there is no need for two bus lanes. Locate one Express Bus Lane in the center between one lane in either direction. Commuters travel north in morning and south in afternoon on weekdays/non-holidays and recreationists travel south on weekend/holiday mornings and north on those afternoons. One lane will satisfactorily handle the Express Buses. A simulation of this traffic model could be developed and presented to the public for further comment.	CYNTHIA MECKLENBURG	Website
5434	Similar gondolas used in Europe significantly reduce congestion and have increased accessible for all, while preserving the environment.	William Sayre	Website
5435	Thank you for putting together these proposals. This is such a huge effort. My main concern is the time required to get up the mountain. For locals, one of the greatest things is the accessibility of the mountains. A one hour gondola ride is not as efficient as I hope. It means to spend a morning in the mountains I spend 2 hrs (round trip) on the Gondola rather than the 20 min drive it currently takes. Even on a bad traffic day it may take an hour to get up there but only 20 min to get back down in the mid day. That is still 40 min less time "commuting". So from a time saving perspective I am in favor of options that keep travel time to a minimum. I am willing to take the bus if the bus will get me there faster than a car. That hasn't been the case in the past so I continue to drive my car (usually with kids).	Kyrk Wright	Website
5436	Heavy user of Albion basin at Alta with two small kids. I prefer the modified gondola option that Alta supports - lowest impact on LCC is best. I'll live with the extra 30 minute drive.	Travis Taylor	Website
5437	I am writing in support of using an enhanced bus plan without roadway widening, and vehemently against the installation of gondolas, to address the transportation issues in Little Cottonwood Canyon. Installation of gondolas would have a severely negative impact on all user groups of the canyon outside of those utilizing the resorts. While I recognize the substantial economic impact of the resorts, it seems unfair and short sighted to even consider a plan that would permanently damage, and in some cases largely destroy, the canyon for other user groups, many of whom call Salt Lake home year round. This is especially true considering there are management alternatives to gondola installation that address the issues while being fair and agreeable compromises between all user groups, and that do not irreparably alter the canyon for those who recreate down stream from Alta. As a frequent and long time user of the canyon, and one who is unwaveringly in awe of it's beauty, I urge you to adopt the plan that would least impact the unique majesty of this wonderful resource. Thank you very much for your time and careful consideration.	Rocco Bocchicchio	Website
5438	After reviewing the impact of each option, I support enhanced bus service as this causes the least amount of impact on the canyon. Little Cottonwood Canyon is a unique canyon that we need to protect from additional road widening or gondolas.	Dallin Sumpter	Website
5439	I am in favor of Alternative 3 - Gondola	Mike Mallon	Website
5440	I would support the enhanced bus alternative but without any more road widening.	Bert Young	Website
5441	I love this idea and hope it gets passed!	Brenley Hansen	Website
5442	I think the gondola works option with the base at La Calle would be such a great solution.	Larry Parkinson	Website
5443	Personally I do not agree with a gondola. Increase bus and dedicated bus lanes. Or get rid of the ikon and epic passes. Traffic got worse and did not allow for a more organic progression towards increasing traffic in the wasatch	Mason John	Website
5444	Extend this base station all the way to the parking garage or else it's still pointless	Josh Christensen	Website
5445	As a resident of Alta Approach and a skier, I appreciate the thoroughness of this study. The alternative I think is best is the #1 Enhanced Bus Service. This alternative will provide sufficient transportation without disturbing more of the natural environment. It is pragmatic and practical while providing planners room for adjustments (tolls, permits, additional stops, etc.)	Mary Ellen Navas	Website
5446	I think ALTERNATIVE 1 ENHANCED BUS SERVICE makes the most sense and is the practical and pragmatic. It also gives planners the greatest number of alternatives going forward, for making adjustments, such as load, road structures, tolls etc to the system. It also promises to cut emissions in the canyon based on bus drive systems.	Bob Archibald	Website
5447	GONDOLAS ARE A TERRIBLE IDEA. THEY ONLY HELP THE SKI AREAS AND NEGLECT SUMMER HIKERS AND USERS. PLUS THEY WILL BE A MAJOR EYE SORE IN THE CANYONS. ANY OTHER ALTERNATIVE IS BETTER.	Don Kauchak	Website
5448	I believe expanding parking at the base of the canyons and increasing bus capacity is the only acceptable solution for Little Cottonwood Canyon. Right now, congestion only plagues users on powder days and holidays, so why invest in a costly, unsightly gondola that will only minimally release traffic? An enhanced bus system coupled with expanded parking areas would make riding the bus more attractive and reduce canyon traffic without dramatically increasing the transit time for skiers, unlike the gondola. A fine could even be imposed on cars driving up the canyon based on the number of occupants of the car to further incentivize using the bus system. The gondola would simply divert the traffic problem- a bottleneck would be created not only at the base of the gondola, but also at the parking lot to catch the bus to the base of the gondola. Having to transfer twice would be a nightmare for all users, especially families. This should be alarming to the ski areas, especially Alta, which prides themselves on being a family-friendly resort. Additionally, if 20,000+ skiers are attempting to get up the canyon on high-traffic days and the gondola only has an uphill capacity of 900/hr, at best 2,700 passengers will ride the gondola during peak traffic hours. This would only reduce the traffic problem by less than 15%- hardly worth the unsightly environmental impact of the gondola and the colossal inconvenience of riding it. In conclusion, the gondola is much more trouble than it is worth, but an increased bus system and parking capacity would be less work to implement with greater benefits to the community. Why ruin our gorgeous canyon with an unnecessary gondola when a much easier solution is available?	Natalia Crimmel	Website
5449	The GONDOLA PLUS LA CAILLE BASE STATION is the best option. 1. NONE OF THE PROPOSALS PRESENTED HEREIN represent a viable solution to the LCC issues. ALL WILL CAUSE IRREPARABLE HARM TO THE NATURAL ECOSYSTEM and will cause increased traffic and congestion. We need to look at other alternatives before investing in proposals which will increase congestion in the area. 2. WASATCH BLVD SHOULD NOT BE WIDENED. Any proposals to widen the road will only bring more traffic and more congestion, and move existing 'pain points' closer to the canyons. 3. VIABLE SOLUTIONS TO LCC TRAFFIC ISSUES INCLUDE: limiting car counts, requiring car pooling, assessing tolls, enforcing no parking areas along canyon roads. All of these options could be implemented with virtually no funding, thereby allowing excess funds to be directed toward increased transit.	Karl Marshall	Website
5450		Rob McGee	Website
5451	Gondola for sure. Less impact on the canyon the better. I love the Bird!	Michael Holliday	Website
5452	I will be very close to the new road and you will decrease the value of my home. Put another way you will screw me on the sale value of my home. Do you people even consider how you will hurt people in this fashion? Is there anyway I could be compensated....not a chance in hell. You will just screw me. Thanks a lot. An unhappy citizen.	Chris Campana	Website
5453	To accommodate the most people AND be the most flexible, a gondola makes no sense. People aren't solely going to the ski resorts. People aren't going to leave their cars behind if they can't get to the hiking trails, picnic areas, & campgrounds. We ought to be creative enough to come up ways to give people incentives to do what they want AND get to where they want to go. I'm willing to pay more (especially if part of that is for jobs for bus drivers & related services) if it will actually give people what they want, not just give the resorts more customers.	Katherine Lake	Website
5454	I have been a climber skier and snowboarder for 40 years in little cottonwood canyon. I believe the only fair and wise decision would be improving and enhancing bus routes. Gondolas would ruin priceless climbing and hiking and biking resources forever. Please don't make that mistake.	Mike Call	Website
5455	All alternatives should be treated equally. Rail has not been considered appropriately. Rail is best long term, year round, environmental solution Rail is most cost effective and has best Life Cycle Cost	Ryan Snow	Website
5456	Please construct the gondola!! The canyons need to be free from car traffic, especially during winter/ski season. The gondola would also lessen car accidents, from snow, ice, and animal crossings during the winter months. I have been stuck up the canyon for 5 hours due to too much car traffic, it is time for that to stop!! The air, animals, and humans using the great outdoors in these canyons deserve better, it is time for us to implement this gondola!! --- I also support it being constructed in Big Cottonwood Canyon as well.	Samantha Beatty	Website
5457	The installation of a gondola system would be extremely detrimental to the environmental surroundings not to mention disregard the natural capacity of the canyon itself. I support an improved public transportation using buses if it has shown it's capability to actually alleviate the stresses of traffic during peak hours, however it seems a bit out of touch that the overhead production isn't being managed by a public transportation agency.	Jacinda Lee	Website
5458	I'm very against the Gondola option	Gwen Springmeyer	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5459	Should start with easy simple and cost effective measures. For example, to charge a high toll for cars. Implement like the highway tolls so cars don't have to slow down to pay it. That and the expanded bus service are clearly the path to pursue. The other solutions are poor ideas as has been detailed by others.	Ed DiBella	Website
5460	I live 5 minutes from the mouth of the canyon. we purchased our home with that distance being a plus. I would hope that living here will keep me from driving further to on a gondola. that and I am sorry to see the cost rise due to cramming the resort to full. the need for more has to have a limit	Herb Witte	Website
5461	Please note that since 1990 I have vacationed, then lived for a season, & have recreated year round in the majestic Little Cottonwood Canyon. We have a priceless wonder in Salt Lake County, the steep, deep canyon that is LCC. I continue to heartily endorse enhanced bus service, LCC EIS Alternative #1. Here in SLC, this is where we live, raise families to appreciate LCC's natural beauty upclose & from a distance, & of course head to LCC whenever we can. We have an incredibly accessible area of forest, lakes & commercial resorts in LCC rather than more remote areas such as in Alberta, Canada. More traffic lanes (peak period shoulder lanes) coupled with enhanced bus service (LCC EIS Alt #2) or a gondola (LCC EIS Alt #3) to deal with tremendous snowfalls perhaps up to ten days a year will not improve anyone's quality of life or quality of experiencing LCC. Finally enhancing bus service, my choice of LCC EIS Alternative #1, would help on these handful or two of super snowy days & other less snowy days. Julia & Roger Lester & family	Julia Lester	Email
5462	I think UDOT should be considering the La Callie based gondola. It seems to make more sense for a number of reasons. Expanding bus service, or expanding the road and bus service, does not solve any of the snow related problems like avalanche closures, heavy snow on the roads, bad drivers wrecking cars and blocking traffic, or parking more cars up the canyon. The proposed gondola from the canyon mouth will not carry enough people per hour to make a real difference in traffic levels, and there is nowhere to park a huge number of cars at the canyon mouth. The cost of all the road construction and maintenance of an expanded road is also really high. Why not work with the private land owner to build a gondola further down canyon where there is more parking, could be restaurants, bars and other commercial activity, and would potentially raise property values in the area around the base station. The CO2 emissions would be way lower than cramming MORE cars onto the road. I have skied all over the EU and almost every town has some gondola system or tram system to bring loads of people up the mountain without requiring cars. They work great. It's also the only solution that will allow us to move people up and down canyon after a road closure. Please consider this solution!	Risa Drew	Website
5463	We should let science determine the carrying capacity of our Canyons. Therefore the less increase in visitor numbers the better. Thank you, Nancy Wingelaar	Nancy Wingelaar	Website
5464	I am in favor of the LaCaille Gondola Proposal	Kerwin Knutson	Website
5465	I am here to say NO gondola NO road widening for a bus lane. These options do not satisfy what this canyon needs. Little Cottonwood Canyon needs fewer people on the road. Fewer people leads to less destruction. The only option I personally would consider is more and better bussing systems WITHOUT widening the road. The number of people allowed to access the canyon should be limited and monitored. I have worked at Snowbird for 6 going on 7 years. The number of people I have seen flood into the canyon in the last two years is unacceptable. These people do not LOVE the canyon-like the people who have been there for years, people do not respect the canyon-like those who have been there for years. NO GONDOLA, NO ROAD WIDENING GET A BETTER BUSSING SCHEDULE/SYSTEM	Mikayla Austin	Website
5466	I believe that the best option for mountain transportation would be the improved bus system via a dedicated shoulder lane. I think that this would improve the speed and efficiency of the buses up and down the canyon while simultaneously cutting down slow moving traffic in the canyon. This would also have a lower environmental impact as well as a less expensive budget when compared to a gondola system.	Wilson bielaczyc	Website
5467	Hello, I would like to state that I am in support of the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC recreation and create the least amount of environmental impact. Thanks! Josh	Joshua Beckner	Website
5468	#1, please, never ever put a tram up LCC.	ERIK Ostrander	Website
5469	#2, please use existing resources before widening the road. Use more buses and increase parking Outside of the canyon. Even with a wider road there is still not enough parking in the canyon during peak usage.	Mike Mooney	Website
5470	I support the Little Cottonwood Gondola I am in favor of the Gondola idea! I really think a reduced vehicle stream in this canyon would be beneficial to our air quality, wildlife, and also to human safety from traffic crashes (especially during inclement weather).	Brooke Lee	Website
5471	Dear Utah Department of Transportation, Mountain lover who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Mrs. Carrie Meek	Carrie Meek	Email
5472	Light rail through to PC	Dave Huston	Website
5473	Please, please, please do not build more in our canyons!!! I am an avid hiker and skier and do not want more building and destruction in these incredibly valuable canyons.	Judith Gooch	Website
5474	The gondola to me seems to be the most sustainable approach, which will not only benefit the winter-sport-enthusiasts but also the locals, due to reduced traffic, no noise or air pollution and better access. The gondola, as the most environmentally-friendly solution will lead the way for future generations to enjoy the canyon as best as possible.	Sarah Harwardt	Website
5475	More is not better. There is no need for greed to drive these decisions. Keep it a quality experience not a quantity one and people will be more inclined to come back. IKON and EPIC passes are a disaster that is driving this. None of these proposals are adequate. What needs to be done is to cap resort tickets to a manageable level, all ticket sales made on line with a voucher, and ticket sales should be incentivized to encourage bus travel (largest discount) and car pooling (discounts based on #passengers), or staying overnight at a resort. If you are single skier driving up alone, you should pay a steep premium. Some form of enforcement would have to be worked out, but this could be done and put on the parking attendants. Anybody without a voucher (back country skiers, hikers, etc.) would simply be allowed though the canyon but not allowed in the resort parking areas. Most of these folks are going to smart enough to avoid prime ski traffic hours anyway.	Bruce MacWilliams	Website
5476	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	David Brotman	Website
5477	As someone that enjoys both climbing and winter sports in LCC, the main goal of this process needs to be the preservation of LCC's natural resources and the reduction of human impact. Enhanced bus service is clearly the best avenue to achieve these goals while still allowing for egalitarian access to LCC. The bus service in both BCC and LCC during the winter, while not being perfect, are clearly working and provide a great experience. Look also to places like Zion national park that have faced similar issues with high levels of car traffic and have solved them with the use of bus services on existing road infrastructure. I am in favor of a blanket ban on cars in LCC to allow for efficient bus service and public transportation. This is the best and fairest way to keep providing access to LCC for everyone that wants it. We cannot keep cramming cars into a canyon of limited size, but allowing cars to park outside the canyon and providing efficient public transport into the canyon will let everyone enjoy it for years to come.	John Sadiik	Website
5478	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	Nick Friedman	Website
5479	I am in favor of the gondola solution with a La Caille Base Station. Further, I think we should have mandatory Traction Control Rules in effect from November 1 to May 31 AND implement a toll tag system for both Cottonwood Canyons. I am a part time resident of Alta and own a home there.	Chad Horne	Website
5480	I support the Enhanced Bus Alternative without roadway widening. I would hate to see this wonderful local outdoor attraction altered or access inhibited due to both temporary and permanent complications due to new construction. I believe an effective alternative would be to make the canyon a fee area or require a parking pass. This could both discourage unnecessary travel while encouraging carpooling or bus use. Less traffic, less impact, and less accidents without closure, cost, or alteration. Let those who pay the daily/seasonal fee offset the cost of maintenance and low fare for the bus service.	Dave Warton	Website
5481	Please go with the gondola!! Save our canyons and do not widen the road to create more lanes for busses! The impact alone on this unique canyons streams and wildlife and rock structures needs to be preserved! Plus long term the gondola just makes sense and is so much more sustainable. Please please please don't dig into this canyon!	Emily Reeder	Website
5482	Hi, I just wanted to voice my opinion on which option I think would be best to alleviate the congestion in Little Cottonwood Canyon. I think by far the best would be the Gondola option. The environmental impact of adding the Gondola would be far less than carving into the side of the mountain or adding additional bus transportation that creates more pollution. Thank you for giving the community the opportunity to speak up about this matter as I know so many locals are frustrated with the congestion that has continuously increased over the years. I know the Gondola is not the most cost-effective option, but I do hope that the people will realize that the Gondola will have the most positive effect on Little Cottonwood for years to come. Thank you!	Gabriella Pineiro	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5483	<p>To Whom It May Concern:</p> <p>We are concerned about the options outlined for transportation in the Canyons. Of the options outlined, Alternative 1 is the best.</p> <p>Alternative 3 is NOT a good idea. We don't need gondolas. They are expensive, especially considering that they are only used part of the year. They might actually increase the traffic problem, rather than improving it, because some people might come just to ride the gondola. Besides, gondolas detract from the view of the mountains. And what would you do with them during a pandemic? Send up each faily in a separate gondola? In a bus, you can at least have people sit one to a row.</p> <p>Alternative 2 is unnecessary. We don't need to widen the Canyon road. The roads are already takes up a lot of space in a narrow canyon. The wider the road gets, the more you have to dig into the sides of the Canyon, a destailizing force. It just adds more to the negative visual impact.</p> <p>Alternative 1 is the simplest and best of the three. But it would be better if you were to disperse parking all around the Valley, so residents (and tourists) can easily access a bus from many places. How about using some of those old shopping malls that are sitting empty?</p> <p>In addition, charge a very significant toll on any car that drives into the Canyon. Right now, it's cheaper to drive than to ride the bus. No wonder there are so many individual cars!</p> <p>We are very concerned because monetary gain seems to be the highest priority right now for the Wasatch. To us, there are many greater values than money. What about clean water, natural areas where we can enjoy some peace and quiet, and protections for this fragile ecosystem? These cannot be bought, for any price. The Wasatch is a gift that provides us with these beauties, but only if we protect it carefully. Please listen to our voice and those of others who love these mountains as a quiet refuge.</p> <p>Carolyn Clark & Rick Gamble</p>	Carolyn Clark	Email
5484	<p>Alternative of Enhanced Bus and no additional roadside capacity, but no reduced roadside parking. Climbing access is huge, and this will effectively shut down access in some areas.</p>	Benjamin Carney	Website
5485	<p>I support the gondola alternative because:</p> <ol style="list-style-type: none"> it is the least expensive alternative; will reduce traffic congestion in the canyon; is the most environmentally friendly alternative because it will reduce car exhaust, it will reduce the amount of roadway pollutants that are carried into Little Cottonwood Creek through surface water runoff, and it will reduce noise pollution for backcountry enthusiasts. will allow for convenient and quick access to the ski areas. <p>While I support the gondola alternative, I believe it should be modified to include an additional parking structure closer to the gondola base so that bus travel time is reduced. The long bus ride from 6200 S (the mobility hub) will discourage the public from utilizing the gondola.</p>	Calah Worthen	Website
5486	<p>Overall, I am very concerned that the draft EIS report does not adequately analyze the impacts of the Alternatives on dispersed recreation, especially in the lower portion of Little Cottonwood Canyon.</p>	Jarhett Jones	Website
5487	<p>I am in full support of a gondola system and as one of the original architects of Snowbird I proposed this 50 years ago. A gondola system will have far less impact on the environment both physically and visually than avalanches snow sheds and widening the road with massive cut and fill. Further the gondola is far safer than driving. Also the I</p>	Jack Smith	Website
5488	<p>Please consider keeping roadside parking open. Thank you!</p>	Matt Lutey	Website
5489	<p>PLEASE no gondola! This will ruin the beauty of the canyon!! And it will still mean there will have to be more parking spaces made somehow. I don't see this as a good solution either short or long term. The low hanging fruit is enhancing the bus service. PLEASE work with UDOT on this. I think we have learned from COVID19 that many, if not most people, will get used to some inconvenience or a need to change behavior. Can't the Forest Service (or other authorized entity) put a cap on number of cars allowed in the canyon?!?! Once people get over being mad, then maybe they'll carpool or take the bus with the Enhanced Bus Service. PLEASE - we must not ruin the beauty & water quality of this canyon. If you widen roads then they just fill up with more cars and we end up with no solution to the air pollution and congestion. Put limits on visitor numbers/car numbers. Create good signs explaining new rules and educating about the value of the watershed. Pay for enforcement of the rules. Provide more buses. Require the community/citizenry to change its behavior. They'll adapt. Save our tax dollars for the most sensible, long term solution - PLEASE!</p>	Sylvia Wilcox	Website
5490	<p>Would rather see more ski buses than a gondola</p>	Jordann Brendecke	Website
5491	<p>I prefer the option of adding more buses in the canyons rather than widening the road and adding snow sheds or building a gondola.</p>	Jennifer Lawton	Website
5492	<p>Please don't put a gondola in or widen the roads, enhanced bus services would be the best route. Gondolas only benefit the resort and not everyone that uses the canyon and only would be useful in the winter. Please add busses to the roads and to both canyons not just little cottonwood canyon.</p>	Cody Wratten	Website
5493	<p>I grew up in Utah and have enjoyed being back for the last 8 years. I can clearly see Utah's growth. I listened in on the public meetings in June and have reviewed the three final plans. As a resident of Cottonwood Heights and a candidate to represent House District 46 at the Utah Legislature, these decisions will impact me and the people of our district, either for the better or the worse. I strongly support Mayor Peterson and his desire for a phased approach. Much could change between now and 2050. Will global warming decrease our snowfall and mean less people traveling up to ski? Will a new generation prioritize air quality enough to prefer taking public transit? Why not set the speed limit on Wasatch Blvd at 35 mph for the coming year and see how this impacts traffic flow? Would this simple change encourage enough people to stay on other north/south road options that the widening of Wasatch is no longer necessary? During the coming year or so, as state funds are drastically reduced due to the pandemic, this is a time for us to be creative and to try some bold, low-cost, environmentally friendly options.</p> <p>I'm receiving comments from my neighbors. No one I have heard from has embraced any of the three final options. For all of us, the enhanced bus service with widening of the Little Cottonwood Canyon segment of the road is the least desirable.</p> <p>Many comments I have heard focus on considering what the canyon can reasonably handle. We would encourage an open discussion on this topic between state leaders and Alta and Snowbird before simply assuming that the taxpayers of our state are ready to give hundreds of millions of dollars to encourage more people to arrive at ski resorts than already do.</p> <p>I applaud your goals of reliability and safety. I appreciate the many hours you have all spent planning and sharing the plans. I am glad you have encouraged comments and are listening to our feedback. The overwhelming response I hear from people is a plea to protect our neighborhoods, incentivize public transport, and minimize impact to our fragile, beautiful canyons.</p> <p>Gay Lynn Bennion Candidate - Utah House of Representatives, District 46 July 9, 2020</p>	Gay Lynn Bennion	Website
5494	<p>How do we plan for future transportation in Little Cottonwood canyon, which is affordable, yet convenient, fast, efficiently delivering many people to multiple destinations in the canyon, not just to Snowbird and Alta ski resorts. It will be particularly important that the transportation system be efficient, affordable, so that the majority of visitors to our canyons use that transportation system. Getting people out of their vehicle and onto a public transportation system, should cut down on vehicle travel, lower air pollution, protect the watershed and preserve a major source of drinking water for the Salt Lake water system.</p> <p>Records show that vehicle travel up Little Cottonwood has been increasing, for as long as I can remember. Statistics show that numbers have been radically increasing in recent years at a rate that cannot be sustained, and something must be done. Quite simply, there is no additional parking available in either Little or Big Cottonwood canyons. Traffic is jamming up, there are not adequate parking with restrooms always during the year.</p> <p>Building a tramway up Little Cottonwood would be an ugly distraction to the beautiful environment of the canyon. Given the minimal number of people it can transport per hour, especially during the ski season, costs to operate this system are extreme. Furthermore, this planned expenditure will only benefit the resort businesses of Snowbird and Alta and paid for, by the taxpayers of Utah. This is totally unacceptable! The system that is needed should be reliable, flexible, and able to deliver travelers to many destinations along the total length of the canyon during all seasons of the year. A reliable system would efficiently ferry climbers, hikers, visitors, resort skiers, as well as backcountry skiers and sightseers. For this requirement, a bus system is the only thing that will work. I believe cars in the canyon will never completely go away; they may only be limited by the number of parking spaces. Therefore, there needs to be inducements to pursue drivers to use the bus transportation system.</p> <p>In the effort to improve efficiencies in the canyon the third "flexible" lane of traffic should be added, along with snow sheds in avalanche paths, more parking lots in the canyon with restrooms, especially tripling the size of the White Pine parking lot.</p> <p>My last thought is that, we do not need further resort expansion into areas such as White Pine, Grizzly Gulch, chairlift going up Emma's Ridge, enabling skier to ski down from Emma and the other sides into Cardiff, Days and Silver Forks or skiing off the south, back side, of Alta. I do like the idea of constructing a huge parking lot, being placed in the now existing gravel pits to the north of Big Cottonwood canyon.</p> <p>Robert Myers, Lodge Maint. Director Wasatch Mountain Club Foundation</p>	Robert Myers	Email
5495	<p>I feel people should use affordable, public transportation! Limit the number of cars and make people take the bus! This would be the least disturbing to the canyon overall!! Widening the road or building a gondola will disturb our beautiful and fragile canyon! There is already a decent road, make maximum use of dependable, steady, and reasonable bus service!!! Have a large parking hub in the old gravel pit space and have non stop buses running to both canyons and limit the cars! A toll type booth at the mouth of both canyons would stop those who insist on always driving a car! No major construction or road widening should happen! This just encourages more cars that go faster! Also a gondola is the most disturbing idea of all. To build this would cause major change and damage to our beautiful canyon.... dumbest idea of all!!! Take the bus people, they are great!!!</p>	Sue Harper	Website
5496	<p>I am in full support of the gondola system and as the original architect and planner of Snowbird I proposed a tram system 50 years ago as I for saw the problem we are now experiencing. The gondola system will have far less impact on the environment both physically and visually than widening the road with massive cut and fill and building avalanche snow sheds The gondola is also far safer than driving in snow and ice conditions. Also very importantly the large parking lots can be reclaimed and deforested greatly improving the visual quality and reducing if not eliminating the air and ground pollution caused by automobiles.</p>	Jack Smith	Website
5497	<p>My vote is Alternative #1 or Alternative #2, the Enhanced Bus Route options. I firmly believe that the Gondola option will detract from the beauty of the canyon, and will increase human impacts in the densely populated area of the Wasatch Range. Both of the Enhanced Bus Route options involve tolling, which I believe is very important for achieving public buy-in for using the buses. One concern I see as a climber is that the bus routes will not stop at many places that I frequent in LCC. Tolling will require recreators to carpool more consistently, which will reduce the problem of parking in the canyon's small parking areas at trailheads. Please consider the two Enhanced Bus Route options with tolling and expanded park & ride parking. LCC and BCC both have this parking issue, where parking is full long before 9 AM on high-traffic snow days in the Wasatch. Thank you for your consideration.</p>	Collin Miller	Website
5498	<p>I would like to see as little impact to the Little Cottonwood area as possible. As a member of the climbing community, we love that Salk lake City uniquely has a mountain environment so close to the city. With that respect the first alternative has the least impact and I would go for that one. I do not want a gondola</p>	Andrew Thaller	Website
5499	<p>Will widening the road and putting in a gondola effect any of the trails? Or the road side climbing? Will that tear up a lot of the environment in LCC? Will the gondola be an eye sore? I understand skiing gives Utah a lot of revenue but the canyon is used for many recreation opportunities and I believe putting in a gondola will have a big impact on the environment and other recreation uses.</p>	Taylor Rogers	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5500	I have read the proposals and I find them sorely lacking. I live very close to Little Cottonwood Canyon and I do not see how these proposals would help with traffic, parking and transit problems. Widening the roadways just puts more vehicles unsafely into the canyons. The gondola sounds nice, but it has no parking availability at the bottom of the canyon and it can only transport 1000 people per hour. And I can see a horrible situation of people waiting hours to board the gondola. The number of parking spaces suggested is not going to help reduce the traffic and congestion. You will need more than one parking hub in more than one location coming from various directions. It sounds like a complete nightmare to have one parking hub for both Big and Little Cottonwood Canyons. A better option would be to have more bus transit coming from various locations in the valley. A shuttle system from numerous hubs would alleviate the problem with parking in the canyons and congestion and confusion at the bottom of BCC. There are so many options that have not been considered. Please do not put more vehicles into the canyon or waste money on an inefficient gondola that will not get used because it will be cumbersome to transfer from a bus and wait in a long line to access. Invest that money in greater access to UTA transit up the canyons. More buses, more options like Alta only and Snowbird only buses creating more efficiency and less waiting for people. Utilize the park and rides west of LCC on 9400 and 9000 South at 2000 East and 300 East. There is seriously so much more than can be done with less money and less environmental impact.	Terri Marshall	Website
5501	I support the creation of an improved Cottonwoods Canyon access solution that does not result in roadway construction that will negatively impact the Canyon's beauty and unique structure, which would be solved by building a gondola system. A gondola system would solve the access and traffic issues, while creating something that would itself be a draw and unique experience. This is a once in a century opportunity that rarely presents itself. Be bold!	Kevin Smith	Website
5502	Gondolas seem to work well all over Europe and seem to have the least environmental impact.	Ari Hobfoll	Website
5503	PLEASE consider the impact of these plans on the climbing community.	Heidi Snell	Website
5504	I believe that the gondola is the best option. While it is in the middle of the costs proposed, I believe it creates a better long-term investment for the canyon than busing would, and also that people will like the gondola more than the other two options.	Samuel Bonkowsky	Website
5505	As someone who has been skiing at Snowbird for the last 45 years, I am a strong supporter of updated transit options that balance traffic congestion, environmental concerns and long term sustainability issues in the most cost effective manner possible. I am in favor of the enhanced bus system along with a gondola to spread visitors evenly over both options and allow for increased scalability in the future.	Eric Baughman	Website
5506	Eric My opinion: The best long term plan for the canyons is an elevated (Utah Life Elevated!) monorail type system of trains. Initially starting up LCC, later extending over or through the mtn. to Brighton and down BCC to complete a loop. Eventually make it a clockwise and counter-clockwise loop. Some trains could be express to the resorts, while others could have multiple stops along the way. From Brighton an initial spur line would go to Park City. Eventually a line could go from Park City all the way to the airport. So the overall plan would be from Airport to Park City/Deer Valley. Airport to the gravel pit at BCC with stops as possible. Gravel pit to Snowbird/Alta --the first to be completed. Gravel pit to Solitude/Brighton. Make LCC/LCC a loop over or through Catherine Pass, or where ever is best. Maybe gravel pit to Alta. Then add Brighton. Than add Park City. Lessen the car load. Keep resorts open in avalanche/road dangers. Help with cleaner air. Help with tourism. Help with more effective people movement. Just some ideas. Respectfully, Sid Tanner	Sid Tanner	Website
5507	I like the La Caille gondola option.	Sean Buckley	Website
5508	Enhanced bus service with no roadway widening is clearly the best option to satisfy all user groups. The gondola is an expensive pipe dream, providing the least favorable cost to benefit ratio. Roadway widening will adversely impact multiple user groups, perhaps most significantly destroying historic bouldering areas that have drawn thousands of climbers to Utah over the years. Additionally, facilitating more personal motor vehicle traffic is an unsustainable model, as future growth will then require ever-widening roads. Incentivize bus usage and place a fee on low efficiency single-passenger cars. This solution is simple, cheap and easily scalable for future growth.	Brian Waters	Website
5509	We would love more travel options so any of these could work. We definitely like the Gondola from La Caille as the best option.	Tyson Lybbert	Website
5510	As a resort skier, Option 2 sounds the best. Please ensure the extra lane is buses only!	Lauren Nye	Website
5511	I love the idea of a gondola if there is parking at the base. Having to bus to the base sounds problematic. I also wonder about people who get motion sick on gondolas.	Carrie Kirkpatrick	Website
5512	I support the Gondola, it is the cleanest and safest option given the situation that exists in LCC	Joseph Dorius	Website
5513	I am in favor of the enhanced bus system plus the additional lane.	Jaime Manning	Website
5514	I am an engineer in Salt Lake City and on a weekly basis year round and I am traveling and parking on the side of SR 210 to rock climb. I am very opposed to preventing road parking in the winter and building a gondola in Little Cottonwood. Widening the road in Little Cottonwood will destroy classic rock climbs and prevent access to other areas. A gondola will also destroy climbing areas and detract from the natural beauty of the canyon. I do favor widening the road along the Wasatch Boulevard. I also favor adding more buses and bus stops. Buses have the least impact and cost, can be electric or CNG limiting environmental impacts, are a reversible change, and most imporly do not impact the landscape which is the whole point of visiting Little Cottonwood. Please do not sacrifice this unique canyon so the city can capitalize on ski tourists.	Jared Linderud	Website
5515	The answer to crowding is to develop alternative areas of recreation along the Wasatch front or better yet working with Rio Tinto to allow recreational access to northeastern side of the Oquirrh Mountains. Dear Utah Department of Transportation, Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. We need to treat LLC as a National Park and stop letting private vehicles access it. There needs to be public parking structures away from the canyons with emission free ski shuttles. That is the only way to solve the traffic issue. Sincerely, Dr. Robert Meek	Robert Meek	Email
5516	I feel you are not considering enough options. I am all for reducing the number of cars in the canyon and like the concept of increased mass transit. Having one parking hub to service both Big and Little Cottonwood Canyons is a horrible idea. You need one hub at the bottom of each canyon with direct buses to each ski resort (Alta and Snowbird for LCC and Brighton and Solitude for BCC). The Gondola sounds like a need idea, but you would need large parking hub at the Gondola to get people to use it. People will not drive to a parking hub and then take a bus only to get off and then wait in line for a Gondola. If you have adequate parking at the base of the Gondola, people will use it and it may also be a tourist draw. Do not go with the Gondola if you expect people to have to park somewhere else and take a bus to get to it.	Mark Gilfillan	Website
5517	PLEASE DONT RUIN THE CANYON BY PUTTING A GONDOLA! that's a ridiculous idea, but my guess is you're probably going to make some money from a gondola and that's what matters most to you As a member of the climbing, hiking, and backcountry skiing communities along the Wasatch Front, I would like to voice my support for the "Enhanced Buses without Road Widening" alternative.	George Wilson	Website
5518	I am in complete agreement with the official comment sent by Wasatch Backcountry Alliance to UDOT, and in particular I would like to highlight a few points: - Solutions should take in to account year-round activities in all areas of the canyon. A gondola will not solve congestion at trailheads that don't originate at a ski resort (white pine, for example). - Solutions must account for getting users to the mouth of the canyon. Scattering mobility hubs along the Wasatch Front, served by busses, will reduce congestion more than requiring users to drive themselves to the mouth of the canyon to find parking. The cheapest, fastest, and best way to iterate to a solution is to move forward with Enhanced Buses without Road Widening. The other options only solve part of the problem for two businesses during a select time of year.	Bryan Lence	Website
5519	Thank you. Locate one Express Bus Lane in the center between one lane in either direction. Commuters travel north in morning and south in afternoon on weekdays/non-holidays and recreational travel south on weekend/holiday mornings and north on those afternoons. One lane will satisfactorily handle the Express Buses.	Leslie Rinaldi	Website
5520	To Whom It May Concern, My name is Caroline Gleich and I am a professional ski mountaineer and endurance athlete. Little Cottonwood Canyon is one of my favorite places in the world, and I frequent the canyon year-round for the myriad of outdoor recreation opportunities from skiing (both at resorts and in the backcountry), climbing, hiking and biking. After carefully reviewing the alternatives, I support the enhanced bus alternative or the enhanced bus with roadway widening for peak period. I am in favor of using low or zero-emissions buses and vans on the current LCC road. To me, busing is the best way to create an inclusive transportation solution that serves dispersed users. It is also incredibly important to me and my community of backcountry skiers to have buses running much earlier in the morning. I'd love to see buses starting as early as 5 am. One of the big problems with utilizing busing is that there isn't availability early in the morning. This would benefit employees of the resorts as well. As a backcountry skier and user of dispersed trailheads, I urge you to consider how each alternative will affect dispersed recreation users. A transit system must include stops at trailheads in order to serve backcountry recreationalists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live. I've seen how quickly the ride share parking lots fill up. The proposal should also consider adding a mobility hub on Wasatch near 3900 S to serve folks coming from Park City and the University of Utah. I'd also like more information on how the tolling in the canyon would work, because tolling is a solution we could implement immediately that would have a huge impact on the traffic issues without waiting years for expensive infrastructure to be constructed. It is important to consider how tolling would disproportionately impact those without economic means. My last comment is about the scope of the EIS. Transportation solutions need to be holistic and consider where people are traveling from. I'd love to see UDOT take a more comprehensive approach. Thank you for the opportunity to comment on the LCC EIS. Sincerely, Caroline Gleich	Caroline Gleich	Website
5521	I love the La Caille site - it makes total sense from a pickup and drop off site with a nice amenity entrance into the canyon. UDOT should consider this site! Gondola is 100% the right solution!!! Teri Klug	Teri Klug	Website
5522	As a resident of Cottonwood Heights living just west of Wasatch BLVD and a skier in winter and cyclist in summer, Option 2 is the only viable option for me. Especially in the summer where we need to make it safer for cyclists / runners and keep them away from cars. Gondola is a terrible idea that will damage our canyon for future generations. Please don't do option 3 Gondola. The less impact on the canyon, the better. Thanks,	Ryan Harmer	Email
5523	I support a gondola for canyon access as best of three present options. Further, as an adaptive skier, providing the option for wheelchair (etc.) users to drive to the resort would be a significantly positive allowance.	J Neb	Website
5524	This past season I appreciated the increased amount and access of the public buses. That seems like a cheaper potential solution to traffic on the road and in the lots. How could this be more incentivized or mandated? The gondola sounds awesome & if it's less impact on the environment and could truly allow fluidity of traffic with decreasing impact on the Canyon then I'm for it.	Paul Hetzel	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5525	<p>After studying the three alternatives presented in the report, my initial thought is that the bus shoulder lane proposal makes the most sense. It is the most grounded - literally - and uses the most traditional travel methodologies of enhanced transit on paved highway. Its opponents argue that the required snowsheds would be an eyesore, but I personally think that these would have less of a visual impact, being tucked against the hillside and with some possible aesthetic improvements, than 30 gondola cars traveling constantly through the air as I look up or down the canyon.</p> <p>However, I am intrigued by the external proposal of the extended gondola with the La Caille base station. If they can truly get that many more people up the canyon that much faster, without a bus bridge, as they claim, it may make the visual impact worthwhile. This additional alternative should be fully vetted.</p>	Kevin Nichol	Website
5526	<p>Besides, I recognize that widening the highway for the bus shoulder lane would have significant impact, with cuts and fills on either side of the right of way that would change the driving experience that I have enjoyed for nearly 60 years. I would certainly mourn the loss of the boulder supposedly held up by a stick that the faithful have been perpetuating all that time. My dad pointed it out to me the first time when I was just a lad and I have since pointed it out to my kids and now grandkids, and any new visitors that I bring to LCC, and I look for it to be sure the stick is still there (and the boulder hasn't been allowed to roll away LOL) every time I drive the canyon.</p> <p>Out of the options presented, I support the Enhanced Bus Alternative (without roadway widening). I also would like to support whatever option on Wasatch Blvd that makes it safer for me to get out of my neighborhood (Russel Park Rd) and also offers an option for walking/biking safely with my family. We currently have a hard time getting out of our neighborhood do to increased ski traffic, speeding vehicles (daily), and are not able to get to the park without driving because of the danger. Thanks for listening.</p>	Gwendolyn Adams	Website
5527	<p>None of the alternatives you propose seem to really address the problem. The Gondola idea is the worst, it is expensive and impractical for most circumstances. The other two are "enhanced buses", which could have been good, but all of the infrastructure proposed with the buses - more lanes and avalanche sheds are not necessary and will destroy more of our natural canyon</p> <p>All the alternatives are intensively reliant upon cars, to and within the canyon. It is clear that a transit agency, and not a road building agency should be the lead in transit service design. I do not support these plans. we need more transit and non vehicle dependent planning.</p>	Cathryn Cordray	Website
5528	<p>I am in favor of the Gondola with a La Caille Base Station. I suggest that there be mandatory traction control for all vehicles from Nov. 1 through May 31. I have been behind vehicles trying to travel down after a storm that obviously should not have been there. A tag toll system for both Little and Big Cottonwood Canyons to encourage car pooling, would be a positive addition and a money raiser to help to fund maintenance of the road conditions. Thank you for the opportunity to comment.</p>	Don Whyte	Website
5529	<p>I'm writing as someone who wears multiple hats with regards to LCC use.</p> <ol style="list-style-type: none"> 1. Our family of 4 buys AltaBird season passes every year. 2. We spend considerable amount of money in LCC including paying for our kids to be on SBSEF ski teams. 3. The kids need to be at the resorts multiple times per week in one or the other resort for training at a specific time. 4. All four family members enjoy backcountry skiing, rock and ice climbing and mountaineering as well. 5. We use dispersed recreation year-round. 6. We live near Sugarhouse Park. 7. We manage a mountain guiding service permitted by Uinta-Wasatch-Cache Forest since 1993 and hold a business license in Alta. 8. Primarily, guides meet guests at dispersed trailheads 9. Guests often come from out-of-town and out-of-country spending a lot of money in LCC for hotel accommodations, food and lift tickets in addition to hiring guides. <p>Enhanced Buses without Road Widening is the only solution offered that is geared to all users, summer and winter, resort and dispersed. However, I'm afraid that solution falls short. If the public transportation solution is not faster and more efficient, people will not use it and nothing will change.</p> <p>Enhanced Buses seems to be an option that offers faster service up LCC and for that reason may encourage users to use bus service instead of private vehicles. It isn't clearly explained how the 3rd shoulder lane would be used. I favor the 3rd lane being a bus and shuttles only lane going uphill in the morning and downhill in the evening. However, the fact that it uses the shoulder for the 3rd lane, would remove all shoulder parking for dispersed use, emergency pull-off and some close to the road climbing areas is a problem.</p> <p>I strongly OPPOSE the Gondola solution as it only services resort use which is at most 30% of the use in LCC.</p> <p>Thank you, Julie Faure</p>	Julie Faure	Website
5530	<p>I grew up at the mouth of little cottonwood canyon, and am so grateful that I was able to use the canyon all year round. Learning how beautiful nature can be, and respecting it from a young age. Let's keep little cotton wood without gondolas that will ruin the view, and would truly only be used in the winter. The best solution would be to have more busses. Let's keep Utah beautiful for generations to come.</p>	Jessica Flores	Website
5531	<p>I much prefer the Gondola PLUS La Caille Base Station plan—best option in my opinion.</p>	Jannika Miller	Website
5532	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Please consider that this is an issue that affects everyone who lives here. If was our mistakes in the past that led us to this dilemma now. Lets not make another mistake for the next generation to deal with. Let's find a way to fix this once and for all, not just put another temporary band-aid on.</p> <p>Sincerely, Mr. Forrest Vargyas</p>	Forrest Vargyas	Email
5533	<p>As a climber I think the most sensitive option would be the enhanced bus service! No need for an extra lane</p>	Mauricio Pernia Garaffa	Website
5534	<p>Little Cottonwood Canyon is part of a land of many uses. These uses are not limited to resort skiing. Police limited access to all users this past winter on several busy weekends despite many users simply wanting to access empty trailheads in the lower and mid canyon. Hikers and climbers frequent the lower and mid canyon year-round. Backcountry skiers access areas over the entire length of the canyon, often at very early hours. While trailhead improvements are proposed as an option, the alternatives for transit to said trailheads during the winter are not clearly provided.</p> <p>It seems the simple solution is the Enhanced Bus alternative. The gondola provides no lower/mid-canyon access and only a single access point for Snowbird and Alta, which each currently have two main access points. It is also relatively slow compared to a bus on a traffic-free road, and has a higher cost.</p> <p>The bus and parking should be free. The bus should come very frequently. In my experience, if a bus comes very often (every 2-5 minutes), I will always choose the bus over driving. The bus should also provide stops at lower/mid canyon locations skiers, climbers, or hikers need to access. The gondola cannot accommodate this necessity. While not ideal, if the bus cannot make stops in the lower/mid canyon, free winter access must be maintained. Tolling access to the upper canyon or charging a high rate for daily parking would be necessary.</p> <p>Snow sheds seem a necessity that should have been put in place years ago.</p> <p>As a frequent user of all parts of LCC, I would be happy to chat more about the proposed plan.</p> <p>Cheers, Ian</p>	Ian Housman	Website
5535	<p>I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing (according to information provided by UDOT). I also support further analysis and research on all proposals, especially this alternative. As a climber who frequents Little Cottonwood Canyon, I want to ensure dispersed recreation is still and prioritized. The other options will negatively affect this recreation and the environment in more significant ways. I support the statements offered by the SLCA.</p>	Anna Wendt	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5536	<p>1) Option 5 lanes on Wasatch, snowsheds in the canyon, and dedicated HOV/Bus priority should be the decision. Gondola makes no sense, all feeder roads will still congest to get to gondola base.</p> <p>2) Opinions/input given from actual residents of the canyon and base neighborhoods should weight more heavily than those from outside areas or out of state.</p> <p>3) Private businesses like Alta Ski and Snowbird resorts should have to provide their own parking for customers just like every other business in the valley/city/state does and not be subsidized with public funds.</p> <p>4) The actual carrying capacity of the canyon needs to be addressed/defined. When is it too many people on the ski slopes or hiking trails?</p> <p>5) Low to no-cost solution to current traffic loads could be implemented with things as simple as even/odd license plate days to cut car volume in half. (Many large cities across the world do this for the exact same congestion problems)</p> <p>6) Only allow a specified number of vehicles up canyon based on total canyon parking availability.</p> <p>7) Only allow vehicles with 2+ occupants to drive up canyon. If this is known/publicized, people will combine.</p> <p>8) More Park-n-Ride lots need to be provided outside the canyons but within reasonable proximity. The vacant Shopko and Fresh Market lots down 9800 S. as an example.</p>	Robert Weaver	Website
5537	We would completely support the Gondola project as opposed to widening the road or adding Bus traffic!	Gregg Nielsen	Website
5538	I would like to see a gondola that connects to big cottonwood and park city ski resorts. This is how most European countries are set up to reduce traffic congestion and would be the most viable long-term strategy as the areas continues to grow and populate. It would also likely be used year round.	Roberta Reichgelt	Website
5539	the gondola seems the best option with minimal cost for upkeep. I think it would be really cool to have the worlds longest gondola getting us to the worlds best snow.	lee vanderwekken	Website
5540	Please consider access to rock climbing. LCC is absolutely essential to the rock climbing community and the community is enormous. Navigating the future of LCC with climbers in mind is imperative!	TANNER JONES	Website
5541	<p>First and foremost, thank you for accepting public comments for your hard work and LCC proposals. I believe I speak for all Wasatch users when I say we appreciate the work that you do to keep us safe and skiing!</p> <p>The most-recent EIS document clearly reflects a lot of work done on the part of UDOT, but it also generates many questions and we feel there are some important fundamental flaws that should be addressed. To that point, we have some comments about what we regard as key issues with this EIS:</p> <ul style="list-style-type: none"> - Public Transit Incentives: There is no exploration of incentivizing Wasatch users/employees to take public transit. Or possibly implementing a tiered payment system to encourage people to take the bus? Similar to the system that Jackson Hole has implemented - cars with 3+ people park for free, cars with 2 people pay more, cars with solo drivers pay most. - Avalanche snow sheds: Is 56 hours/year of canyon closure worth \$72-86 million of taxpayer dollars? A snow shed would not keep the road open nor make for a considerably faster clean up in a storm such similar to February 9-11, 2020. Although the proposed sheds cover the most common slide paths, there are many other dangerous paths up the canyon that would keep the canyon closed during a high risk storm cycle. - The current EIS does not address the concept of multiple Mobility Hubs other than the one on 9400 South and the one at the Gravel Pit. WBA thinks that the transit system needs to originate at locations around the valley (ie. U of U/Foothill, downtown, airport, WVC, Draper, West Jordan and points farther south, etc.) so that people can access the bus where they live, rather than drive their car to a mobility hub to catch the bus. When faced with this choice, we suspect many people will choose to remain in their cars rather than use the bus. - There is very little discussion of the needs of non-ski resort, dispersed users (in particular with regards to the White Pine trailhead, which has already increased in use to the point where it's dangerous due to on-highway parking in both summer and winter). - We do not see any financial life cycle analysis (capital and operation, maintenance) of any of the options presented over the projected timeframe. Given that the least-expensive option will come at a cost of ~\$100 for every single Utahn, this is relevant). - There is no mention of any interim solutions, and according to a UDOT spokesperson, UDOT has "no idea" what to do in the interim, nor are there any approximate timelines to actually identify what the "interim" is. LCC is facing an acute problem now that will only worsen, and the lack of timelines is a major missing component of the EIS. - There is only token consideration given to the effects of each of the options on the vital LCC watershed, either by construction or ongoing use. - There is very little/no mention of tolling on vehicles, though it is our understanding that the Utah state legislature specifically allocated considerable monies to UDOT to consider tolling, and as noted above, the Wasatch Backcountry Alliance is a proponent of tolling. - The EIS provides no rationale for UDOT's winnowing of 35 different options to these three. <p>Again, thank you for accepting comments and considerations. I look forward to the resolution to save the canyon.</p>	Anna Tedesco	Website
5542	<p>More buses! And a gigantic parking garage that doesn't have a light to jam up traffic before it.</p> <p>I am writing to support Alternative 1 in the Little Cottonwood EIS. I am vehemently opposed to Alternative 3 that would build a gondola system to Alta and Snowbird.</p>	Dan Krauss	Website
5543	<p>We need a comprehensive planning approach that recognizes ALL users as well as the ecological and watershed services and values the Wasatch Mountains provide. Resorts (Alta and Snowbird) represent just 30% of overall Little Cottonwood Canyon use. A gondola would not meet the needs of the 70% of other users who participate in a variety of dispersed recreational activities. A gondola would forever change the nature of Little Cottonwood Canyon and would barely make a dent in vehicle traffic - 3000 people in gondolas; 18,000 cars. The negative visual and environmental impacts - 20 towers and 30 gondolas constantly moving up and down the Canyon - far outweigh any benefits.</p> <p>Enhance the bus system (Alternative 1) and stop incrementally enabling cars in the Canyon! This alternative provides the least environmental impacts while also providing the most equitable access for all citizens.</p> <p>I grew up skiing at Alta and then later Snowbird while also actively skiing the backcountry. And, in the non-skiing months hiking the amazing side canyons, ridges and peaks. I raised a family in Salt Lake City until moving to Portland, Oregon. My wife and I visit SLC regularly to be with family and to enjoy the natural beauty this part of the world provides.</p> <p>We can protect the Wasatch while still providing equitable access for all people - we just need to change our behaviors and expectations for access. Let's not spoil the Wasatch by continuing our own spoiled (and outdated) sense of access and economic development.</p> <p>Thank you for your consideration,</p> <p>John LeCavalier</p>	John LeCavalier	Email
5544	I believe the best option is increased bus service with NO widening of the road. This is the most environmentally friendly option and also the option that will alleviate the horrific traffic problems the fastest. Furthermore, I believe the proposed gondola option is awful. This seems gimmicky at best and I don't support the proposal even 1%.	Ryan Malavolta	Website
5545	I am against a tram going up the canyon and the environmental impacts and tax payor dollars it will use to only benefit a small portion of our community and tourists and we have to pay the bill and live with the impact. I think a bus system is more reasonable and responsible!	katy scott	Website
5546	What a failed attempt at finding a solution for LCC. None of these are good options, but if I had to pick one, it would be enhanced bus. Additionally, during peak times, the road should switch to uphill only and downhill only, to allow double the traffic move up and down canyon. This would easily alleviate congestion issues. I think the gondola is a horrible idea and only a marketing play, but if it is the option in the end, the road should still be open for backcountry skiers to access trailheads and roadside parking.	SEAN RYAN	Website
5547	<p>Dear Utah Department of Transportation,</p> <p>I am a climber, alpine and backcountry skier, alpine hiker and runner and I do not believe there has been enough transparency and discussion over this critical, long term impact decision. I frequently travel up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. In the near term, I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. In addition, I believe greater community involvement and publication of the decisions made to arrive at the remaining three options is necessary prior to conclusion.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a community member, I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. 5549	<p>1) Option 1 is the best alternative from the 3 presented. (5 lanes on Wasatch, snowsheds in canyon and dedicated/priority lanes for HOV/busses would be best. No gondola).</p> <p>2) Input/Opinions from canyon residents and adjacent communities should weigh more heavily than those from out of the immediate area or State.</p> <p>3) Ski resorts should have to provide parking for their own customers just like my and every other business in the City/State does.</p> <p>4) Public funds should not be used to directly support private businesses. (I'd love it if a huge multi million dollar ad campaign were spent every year to bring people to my front door and then when they actually came and clogged the roads, a new highway could then be build on taxpayer funds to bring them to me more efficiently - brilliant! At least for me...)</p> <p>5) When is enough? What is the carrying capacity of the ski slopes and hiking trails? At some point there is a quantifiable number - just like in our National Parks, etc. A reservation system and or Toll system will eventually need to be implemented.</p> <p>6) A low-to-no-cost immediate solution to help mitigate the current traffic loads would be to institute an even/odd vehicle license plate policy on alternating days or weekends. This would cut traffic in half and promote more rideshare. (Many large cities around the world do this currently with success)</p> <p>7) Provide more Park-n-Ride lots within reasonable proximity to the canyon mouths. Easy examples are the vacant parking lots on 9800 S at the old Shopko and Fresh Market locations. Heck, they are already paved! Just put up a sign! You cant get much lower cost than that...</p> <p>8) 9800 S. / Little Cottonwood Canyon rd. on the South side should be closed to up-canyon traffic during the ski season beginning at Wasatch Blvd. The congestion/gridlock there is a medical hazard to all residents who cannot get emergency services when needed. And the School busses which also cannot get through.</p> <p>8) Finally, whatever happens, people will scream, lawsuits will start, backroom money will flow, and Udot will do whatever they wanted to do in the first place now having completed the dog-and-pony-show of supposed public input. (Sorry for my sarcasm and disillusionment.... After residing 40 years in the area, actual property ownership in both canyons, and observing the public sector at "work", this is where I have landed... depressed.</p>	robert weaver	Website
5550	<p>UDOT has failed the stakeholders of Little Cottonwood Canyon in this short sighted and incomplete EIS. UDOT's proposal does not recognize distributed use in LCC - its preferred Gondola alternative only stops at the ski resorts and has no parking facility at the bottom requiring both busses and the gondola to go for a day of skiing. I hesitate to use the word STUPID but since it fits so well, I will say this proposal is stupid. Building a gondola to transport 3,000 people when there are 18,000 people who use cars is a very expensive bandaid for a very small part of the problem. I prefer the greater use of free busses, running every 2 minutes during peak times and every 15-20 minutes during off peak times until into the evening hours, along with widening LCC road to provide a reversible center lane for busses only. Busses would merge into the appropriate outside lane for stops. The penalty for cars using the Bus-Only center lane would be impoundment and sale of the vehicle. Busses - frequent and free - are THE SOLUTION for reducing the amount of congestion and air pollution in the canyons. UDOT's EIS does not even address air pollution. Presumably because UDOT is only capable of building roads and is not looking at a holistic solution to transportation in LCC. And the EIS does not address at all the similar problems in Big Cottonwood Canyon. Avalanche sheds are also a very expensive bandaid for a very small problem. There are fewer than 10 days per year that the canyon is closed due to avalanches. Temporary closures for shooting avalanches would still occur, closing the road (and gondola) during shooting. These sheds would be terribly expensive to alleviate only a few days of closure (and I would assume there would also be some closure days that would occur even with avalanche sheds). There is also the problem that most avalanches stop on the roadway, and therefore on the avalanche shed, where the snow would sit for the remainder of the winter. Engineering and building a steeper slope near the bottom of the "U" shaped canyon would be an environmental disaster. Based on the foregoing, I encourage UDOT to step back and propose a more holistic solution, addressing air pollution and the issues in Big Cottonwood, removing gondolas and avalanche sheds from the proposal and making free and frequent bus service the core of a future proposal.</p> <p>Sincerely, Michael Dervage Kathryn Collard</p>	Michael Dervage	Website
5551	<p>I live on Dynasty Way, south of Kings Hill Dr. and one block east of Wasatch Blvd. I have lived here since 2000. Yes, the congestion on weekday afternoons (4 - 5 p.m.) during ski season is heavy, especially to turn right, or north out of Kingshill Dr. on Wasatch. It is also expected and heavy on Weekend mornings and afternoons during ski season. The rest of the year, the traffic is light to moderate. It is at it's heaviest during morning and evening rush hour traffic. The rest of the day it is very light.</p> <p>My concern, with safety on Wasatch Blvd., is when I am turning right on Kingshill Dr. to go North on Wasatch. About 100 yards south of the intersection is a blind curve in Wasatch from the south. Cars and trucks get up to freeway speeds around that corner. It is also scary to turn left from Wasatch onto Kingshill there. Sometimes traffic is going so fast northbound that they careen over the middle line and into the left turn lane onto Kingshill. I am sure there have been many accidents. I have narrowly avoided one with a Mac truck going too fast and careening over the middle line.</p> <p>A light at that intersection might help. Lower speed limits along Wasatch, especially before that curve I mentioned, might help. I do not think broadening the road will improve anything. The population isn't going down. The traffic will always bottleneck at Little Cottonwood Canyon's mouth. This bottle neck will always extend back to I-215 because there are so many people trying to get up the canyon. A gondola would ruin the canyon's natural beauty, and ship too many people to the ski resorts. The resort's parking lots limited size, and the bumper to bumper traffic up the canyon, keeps a good number of people on the ski slopes down as a hidden benefit. If safety if the main concern, perhaps avalanche walls up the canyon road would help. As far as widening Wasatch - I have a problem with that as I live one block east of Wasatch Blvd. Homes will be demolished, and local property values will go down while our taxes keep going up.</p>	Sonya Campana	Website
5552	<p>And don't forget the bottleneck of the canyon, which backs traffic all the way out to I-215 and westward down 9400 S. Widening the road gives 5 lanes of idling car pollution while they wait to crawl up the canyon. It is bad enough the way it is - why make it worse?</p> <p>I think the gondola option is best bet. Go for it!</p>	Jim Meaney	Website
5553	<p>Hi,</p> <p>I would like to start by saying thank you for holding the public hearing meetings. I was able to attend the in-person meeting and found it to be super helpful. It's evident that you guys have put in a lot of hard work and have tried to see this project from every angle. As someone who spends a lot of time in the canyon and lives in the neighborhoods surrounding it, I am very grateful for your thoughtfulness and thoroughness in this project. On that note, here are my thoughts about it:</p> <p>Busses will not solve the problem. If you are going to try to reduce the amount of cars on the road you have to provide an option that is appealing enough to get people out of their cars and onto the public transit option. I have yet to talk to anyone who gets excited about riding the bus. The gondola on the other hand, can be exciting. Not only does it solve the problem of being impacted by inclement weather, but it has added benefits of offering views of the canyon that are not easily accessible otherwise. When faced with the possibility of spending two hours in the car or being able to cut that time in half while watching the storm in the gondola, I would absolutely go with the gondola. I would almost rather not ski than face the possibility of getting stuck on the bus. Since the bus is on the road and snow falls on the road you can't get around the possibility of getting stuck or delayed because of the weather. I fear that if you decide to go the bus route, you'll find that people are not willing to ride it. If you go with the gondola, you may find that it becomes its own attraction. You may even wish to consider running the gondola in the summer as a source of revenue to support the canyon.</p> <p>I liked the idea of having two northbound and two southbound lanes on wasatch. I worry that if you go with the one northbound lane we'll wish we had the one more in ten years.</p> <p>Thank you again for all your hard work in this.</p> <p>Best,</p>	Whitney Flygare	Email
5554	<p>Enhanced Bus Alternative (without roadway widening) is the way to go in my opinion. I feel that this is the least invasive way in order to protect Little Cottonwood Canyon and the current access for everyone to enjoy. Please consider this as the main option as others, I feel, would affect many of the current areas people like to go to in the canyon.</p> <p>I am in favor of greatly enhanced bus service into and out of LCC, plus tolls for private cars in a way that incentivizes car pooling. A moderately priced "season pass" for the toll road should be made available to residents of Salt Lake County.</p>	Emmeline Wang	Website
5555	<p>Bus depots and parking should be constructed OUTSIDE of the the canyons, and NO ADDITIONAL road construction/capacity or additional lanes should be built on any of the canyon roads. One possible exception on construction may be strategically placed snow sheds in particularly avalanche prone sections, this in order to reduce hazard to the roadway and reduce canyon road closure time.</p> <p>I am NOT in favor of a gondola, as it's only a gimmick that does not solve the transportation problem at hand.</p>	Joseph Vargyas	Website
5556	<p>NOR am I in favor of widening any canyon road. It is totally unnecessary and indeed counterproductive. Frequent busses and convenient parking outside the canyons is the best solution.</p> <p>In favor of a gondola BUT consider by the time the project is built, the technology will be outdated</p>	A J	Website

5557	The Gondola with the proposed La Caille base/hub station is by far the best transportation option in the proposal. I truly hope to see this come to be, and quickly.	Christa Pottenger	Website
5558	I have been following the Wasatch Blvd conversation for a long time. I cannot understand the logic of this proposal. The idea of putting in a seven lane road would cause an unbelievable backup at the point the road narrows. Have you considered the safety of the people living in the area? What about the air pollution being created? Will you be sued years from now for severely affecting the health of the community? What about the dust and dirt that will be created? The only idea that makes any sense is to add a third lane that will take bus traffic one way in the morning and the reverse way in the afternoon.	Elaine Miller	Website
5559	Dear Utah Department of Transportation, I am a climber and backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Jason Funk	Jason Funk	Email
5560	I have spent countless hours with program managers, consultants, and others discussing SR210 issues. I don't believe that expansion of mass transit (UTA Buses) or gondolas will do much by themselves to alleviate traffic without controls in place making ridership the only option. By this I mean physically restricting traffic when the canyon parking is overwhelmed. Many commuters travel with boot bags, spare skis, lunch coolers and such. The bus does not lend itself to extra carry on needs. MOBILITY, RELIABILITY, AND SAFETY are all tied to highway maintenance capabilities which are presently insufficient. Station 233 needs more funding, equipment, staffing, and infrastructure to provide a more robust in-canyon presence (sand/salt refilling, re-fueling, and repairs). Despite a century and a half of progress, the route up the canyon is still via the old mining and railroad grade. The roadway should be re-engineered to reduce unnecessary grade, turns, and pitch. Intersections that cause delays because of having to cross opposing lanes of travel should be reduced or re-engineered to merge from the right. (over or underpass features) A better maintained road with engineering to keep traffic at design speed will improve mobility and efficiency. It still does nothing to address limited parking and traffic volume. The "public safety" closures at the mouth of the canyon implemented last year when traffic volume overwhelmed our abilities to manage it were effective although more messaging and alternate transportation is needed when this occurs. A November-May administrative rule for properly equipped vehicles at all times is needed. Conditions change rapidly and ill equipped vehicles cause mobility problems every time the road is snow covered. Each of the three options have potential but each need to function as an accessory to a well maintained and designed roadway until such technology exists to replace the many forms of transportation that occur on SR210. Thank you.	Mike Morey	Website
5561	I would say I am against any gondola in the Canyon and would prefer to see more buses and incentives for public transit and carpooling. I worry about environmental impacts of widening lanes in the canyon but I generally support a greater emphasis on transit over a gondola project. Thanks!	Bianca Lyon	Website
5562	It seems the gondola would have the least impact on land and animals while having the greatest impact on traffic and pollution.	Sara Watchorn	Website
5563	Please consider increased busses without widening the road as the pragmatic solution to LCC congestion. Dear Utah Department of Transportation, I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Mr. Davis Lentz	Chris Shauger	Website
5564	I support UDOT's work developing alternatives to address the congestion in Little Cottonwood Canyon. I live in Salt Lake City and visit the canyon frequently, for rock climbing, hiking, and snowboarding (in that order of frequency). As a rock climber, I am concerned that many of my favorite bouldering areas would be negatively impacted by lane-widening, as so many of them are close to the road already. I am also concerned that the gondola option would make access to dispersed recreation sites like climbing areas very difficult. I therefore am most supportive of the enhanced bus service alternative (with no road widening) with my second choice being the gondola alternative. Thanks for your consideration.	Davis Lentz	Email
5565	I am in favor of the enhanced bus alternative with no road widening as this is clearly the option that balances cost with the potential negative impacts to both the environment and sheer beauty of LCC. Additionally, this option could be implemented immediately.	Dain Smoland	Website
5566	The Gondola with the La Caille base station is the best option and has my full support.	Shannon OGrady	Website
5567	Save the boulders!!! If expanding the roads or the gondola will affect the climbing areas at all... don't do it!!	Christalyn Pottenger	Website
5568	Gondola install to avoid avalanche danger on the road. Better skiing experience. Safer and less cars on the road.	Nicole Maila	Website
5569	I think the gondola proposal is the best alternative. It bypasses all of the problems with a road, i.e. slide offs, avalanches, rock slides, and seems like the most environmentally friendly in terms of emissions from cars and other vehicles. Plus, I don't think the traffic will decrease at anytime in the future, just increase. I believe the gondola proposal would be the best way to handle the traffic problem.	Will Ducey	Website
5570	I vote for the Peak Period Shoulder Lane Alternative. Also, would Alta only and Snowbird only buses be a possibility? As an Alta skier, riding the UTA buses right now takes longer when they have to loop through Snowbird to drop off and pick up passengers. Thank you.	Jolene Farley	Website
5571	As a recreational user in the canyon (climber), I do not support the widening of the road or installation of a Gondola. Please consider the use of the enhanced bus option with no roadway widening.	Jay Lyons	Website
5572	The widening of the roadway compromises the ability for climbers to access roadside boulders, which are accessible primarily via roadside parking along SR-210.	Paul Shin	Website
5573	I vote/prefer the Enhanced Bus Service with NO road widening in LCC. Of the 3 proposed options, I feel this is the most immediately effective option, with the least overall long-term impact on the surrounding environment and communities. Having enhanced bus service also provides a solution for both winter and summer activities, albeit prioritizing the ability to access more areas up and down Canyon as needed/wanted, vs. prioritizing direct access to the resorts solely (i.e. Gondola) – In my mind and opinion, an ideal solution would be one that 'first' focused on increased infrastructure from the airport and city out to Cottonwood Heights and BCC/LCC (i.e. enhanced bike/train/public transport infrastructure + greater capacity parking and/or loading areas in and around Cottonwood Heights and BCC/LCC). From there, you then focus on Zion NP-style Bus service up both canyons, as the primary way to access. You can also create 'pass-through' options for vehicles of Canyon Residents and/or third-party Shuttles (i.e. bike/airport/resort/etc.). You could then tailor the bus services (i.e. some that stop at every stop and some that prioritize workers or direct service), which would give everyone an option of getting up and down Canyon(s). This would also limit traffic in the Canyon(s) to either Bus, minimal personal vehicle traffic, or third-party Shuttle (i.e. airport or Bike, etc.), which would ideally contribute to an overall decrease in the variability of traffic, helping to offset the complexity of managing road conditions and safety. Going further, making these buses electric would certainly help minimize the overall impact. – While I do appreciate the forward-thinking approach and process that we are currently undergoing, I still feel as though the options being offered/proposed aren't quite optimized for the greater population of users (or the anticipated growing population) at this time.	Chris El-Deiry	Website
5574	I support the gondola option	Doug Finlinson	Website

5576	<p>I would to thank all the entities involved for pursuing the transportation alternatives for LCC to help alleviate congestion, negative environmental impacts from congestion and traffic and enhancing the user experience by doing so while trying to preserve the beauty of space. I feel the gondola option best fits the goals for traffic reduction and impact to the canyon while enhancing the user experience and creating an experience that embraces the beauty of the space. A tremendous amount noise pollution will be mitigated through this option upon completion. Having used the existing highway access up the canyon for decades I feel the positive experience connecting to nature has depleted tremendously by the volume of automobile use to reach the top of the canyon. I feel the impacts of gondola towers offsets the congestive nature of automobile noise, pollution, and traffic. Having "base" parking site area options would also help in dispersing users to the canyon during max load in load out times. I would be in favor of seeing a public/private partnership scenario that embraces these options and mitigates public resource impacts by allowing private participation in the development of the gondola option. The incorporates and leverages a tremendous amount of existing knowledge and talent that could save taxpayer dollars and enhancing the experience. Thank you for all your efforts and I'm hopeful to see the positive improvements in action. Jeff Riehl</p>	Jeff Riehl	Website
5577	<p>Enhanced Bus is the best option. The level of recreation in the lower canyon is significant enough to protect access for everyone. Not just improved access for people at ski resorts.</p> <p>Thank you, Ian</p>	Ian MacDonald	Website
5578	<p>On behalf of Visit Salt Lake, we are incredibly supportive of this option. Thank you for the amazing work that has been done thus far and we truly look forward to supporting however we can.</p> <p>Thank you, Kaitlin</p>	Kaitlin Eskelson	Website

5589	<p>1. You have not done a wildlife/environmental impact study??? Shouldn't that be one of the first considerations of regulating transit into one of the premier wilderness areas in the country? One of the reasons I moved to SLC was because of proximity to wilderness. I would prefer an option that least affects the quality of nature and wilderness. I vote for Alternative #1. It has the least permanent physical and environmental impact, and there is more flexibility to altering it to fit future needs. Electric or natural gas buses or shuttles should be used whenever possible.</p> <p>2. Absolutely no gondola- no to Alternative #3! I am a climber, hiker, and skier (both resort and backcountry). Like many people, I go to LCC year-round to escape urban life. I don't want to see 20 towers blocking my view of the cliffs and reminding me that I am unable to truly get into wilderness. We need to maintain as much of the natural wilderness as possible. Installation of gondola infrastructure will irreversibly alter the canyon, it is not flexible, it will primarily benefit IKON, Snowbird and Alta ski resorts during ski season and they aren't contributing funds. The resorts will be taking advantage of tax-payer money. In addition, there is no way to access trailheads between the LCC base and Snowbird, so the gondola option is useless for other canyon users other than resort goers. This alternative only serves the ski resorts and maybe some tourists who want a Disney experience. LCC users are not going to pay to park, pay to take a bus, pay to take a gondola that doesn't take them where they don't want to go. Then if roadside parking is prohibited, that basically removes access for many people to recreate, unless they are going to the ski resorts.</p> <p>3. Are ski resorts going to have greater weigh-in for a gondola alternative because they are big companies with more power than individuals? What transparency will there be in the ultimate decision.</p> <p>4. I don't want any roadway widening in LCC, so no to Alternative #2. I don't think it adds enough value compared to #1. There are many climbing areas that are close to the road.</p> <p>5. If a gondola is built from the base of LCC, how are you going to enforce no kiss and ride? I guarantee people will still do this. It will be similar to car idling enforcement – none. There are many, many people who won't want to take a bus from the gravel pit and then take a gondola. The people who ignore the no drop off rule will create more of a traffic and safety hazard than the people who park on the roadside within the white lines near the ski resorts and other climber access areas.</p> <p>6. I use FrontRunner daily and it is usually late – ask any commuter, it is totally not dependable. The more mechanized the transport, the greater likelihood of breakdowns and harder to fix. How will UDOT and UTA ensure that gondola schedules will be reliable during winter? Or throughout the year for that matter.</p> <p>7. What will be fares for the buses? Can UTA passes be used for LCC buses? Parking costs? If these additional costs are too high, it will be difficult to get 30% of people to shift from cars to public transportation.</p> <p>8. More people are moving into the Salt Lake area, 1 million in the next decade. There will likely not be enough parking to accommodate everyone will want to access LCC in winter despite UDOT projections.</p> <p>9. An imbalanced-lane alternative for peak times works well in large cities, it should work well for Wasatch Blvd, without increasing footprint with Wasatch Blvd lane expansion.</p> <p>10. Show sheds should be as low impact as possible. How will they impact wildlife?</p> <p>11. Roadside parking should be maintained near the ski resorts. Climbers will not be able to access Hellgate cliffs. 95% of vehicles stay within the white line. I don't think it impedes snow removal. People on foot can see up the road and if a vehicle is coming, pedestrians move aside. This is an example of fixing a problem that doesn't exist –except it would probably benefit the ski resorts.</p> <p>12. Regarding the 3 trailhead parking alternatives, access to many climbing areas between the LCC base and Gate Butress will be lost with Alternatives 1 and 2. So absolutely NO to #1 and #2. Why does the Gate Butress parking area need to be paved with painted lines? Leave it alone. 21 spots at Gateway Butress is NOT enough for all of the people who park there throughout spring, summer and fall.</p> <p>13. If Utah really wants to have an impact in reducing cars on the road, UTA needs to study how people can efficiently utilize Trax, FrontRunner, and buses to access LCC. No one will efficiently utilize all of the transport systems if it is going to take 3 hours to get to where you want to recreate. FrontRunner doesn't even run on Sundays. What a waste of a transport system.</p>	Janice Sugiyama	Website
5590	I am a long-term resident of the Wasatch Front, and a skier, climber, and hiker. I support the comments prepared by Save Our Canyons and those prepared by the Salt Lake Climbers Alliance (SLCA). Given the alternatives presented, I support the Alternative of Enhanced Bus and no additional roadside capacity, with such caveats as presented by SLCA, as this Alternative would have the least impact on the outdoor recreation resources with the information currently provided by UDOT, particularly for world class dispersed recreational uses and especially for the lower portion of Little Cottonwood Canyon. The gondola as a proposed alternative is completely unacceptable. It would do little to mitigate peak traffic due to limited carrying capacity and is not necessary. The visual impact of the gondola and its infrastructure is unacceptable to move a small portion of skiers to the ski areas. It would be expensive, unsightly, and inefficient. All alternatives must include enhanced public transit to Little Cottonwood Canyon and parking solutions to relieve congestion at and leading to the mouth of Little Cottonwood Canyon.	Teresa Crockett	Website
5591	I have been a season passholder to Alta and/or Snowbird for the past 28 years and typically ski 100 days each season. I believe Alternative One should be eliminated. The best alternative as proposed is Alternative Two, enhanced bus service with dedicated bus lanes and snow sheds. However, I would strongly favor Alternative Three if there was base station parking and a dedicated bus lane along wasatch from the gravel pit for overflow parking. In addition, the gondola style (at least up to the Snowbird Station) needs to be a 3S with a higher line speed and must have enough cabins to allow for short cabin intervals and maximum capacity. Two minute intervals as proposed will not be sufficient. If these can be achieved, then a gondola would definitely be preferred as it would get vehicles off the road, reduce emissions and would be more reliable regardless of avalanche or weather conditions. However, if there is no base station parking and not enough cabins to effectively reduce the travel time, then the gondola option loses its appeal in all but the absolute worst weather/avalanche days and will not be as effective at mitigating traffic.	Jim Steffen	Website
5592	As a resident of Cottonwood Heights I support the implementation of a gondola in little cottonwood canyon to decrease vehicle congestion and emissions in our neighborhood and valley.	Brittani Rolf	Website
5593	The gondola and road expansion ideas are FLAWED and WRONG. While there is undeniably a huge traffic problem in the Wasatch, giving money to an agency that exists to build means that the only solution you can imagine will involve lots of construction. These plans will almost certainly not work and will definitely come at a huge cost to local ecosystems and taxpayers. An effective gondola system requires either a huge amount of parking near the mouth (which there is no space for), or an effective transit system, which does not currently exist. Widening the road will do nothing but funnel more traffic in to the canyon. This is a BEHAVIORAL problem, NOT and infrastructural one. One effective strategy to change this behavior would be diverting a portion of this HUGE amount of money to the UTA to invest in busses that it is actually convenient to use public transportation!	Tucker Mirams	Website
5594	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p> <p>Sincerely, Mr. William MacDonald</p>	William MacDonal	Email
5595	Expensive, high impact projects (such as a gondola) are completely inappropriate for supporting access to the resorts, that benefit the resorts. Access to climbing, and backcountry skiing will be negatively influenced. Additional bus service, a toll road or other lower impact options need to be considered to preserve the wild and scenic beauty of LCC.	Mick Schein	Website
5596	I've been coming on holiday since 2006 to Utah for the skiing. LCC is simply the best in the world. The addition of the gondola would be a beautiful addition. Floating over the canyon and moving Steadily towards the skiing whilst admiring the views, instead of chasing red tail lights. Make the best untouchable: build the gondola!!!!	Stuart Whittington	Website
5597	As a 4 season user of Little cottonwood canyon, I support no additional widening of the road as a first choice. A close second would be the widening of the road for enhanced bus route. I do not support the gondola in any way, shape, or form.	Daniel Clark	Website
5598	NO GONDOLA.		
5598	We don't need construction in the canyon. We need 4 season attention not just for what could be a short ski season. Buses to run on a regular basis and addressing parking facilities should be the priority. Widening Wasatch only benefits more cars. A toll situation like Millcreek uses should be used to encourage carpooling.	Anne Zeigler	Website
5599	Please consider the gondola option with station opposed to widening the road.		
5599	Thank you for consideration.	Kim Turner	Website
5600	I currently take advantage of trails, climbing areas, and of the resorts in Little Cottonwood. I am concerned for the preservation and accessibility of trailheads and bouldering areas in particular, as well as maintaining equity of access to communities who might be impacted by an access fee. I personally support enhanced bus access to the resorts - the model set in Zion Nat'l Park, which bans vehicles for the most part and provides a free shuttle (albeit after paying a park entry fee), comes to mind. As fast and cool as Gondolas are, I think that limiting private car access and requiring shuttle or bus usage to the resorts is ideal for limiting traffic and not reducing access to intermediary trailheads and climbing areas.	Cassidy Wasko	Website
5601	I am for the gondola and reducing personal cars in the canyon.	Ed Chauner	Website
5602	As an avid climber I frequently recreate in the lower portions of Little Cottonwood Canyon (approx 2-3 times/week certain months of the year) and I am very concerned about the impacts that installing a gondola or widening the roadway would have on the canyon. Many of the climbing resources are found close to the road and a gondola or roadway widening is guaranteed to have a negative impact on this resource that is enjoyed by so many in the SLC area. Based on the information that UDOT is providing I am in favor of the Enhanced Bus Alternative without widening the roadway. In addition to having less of an impact on the canyon the Enhanced Bus Alternative seems affordable and can be implemented quickly. Thanks for the opportunity to provide feedback.	Matthew Robbin	Website
5603	Matt Robbin		
5603	UDOT's three alternative are costly solutions which fail to fit the problems and opportunities in Little Cottonwood Canyon. Enhanced buses are a low cost, flexible response to the problem of canyon crowding. Our shrinking winters and snowpack alone argue against massive capital-intensive projects which would offer at best marginal and limited benefits to the public. We have far more pressing needs and UDOT could be fully occupied in responding to those.	Henry Whiteside	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5604	<p>UDOT's Imbalanced-lane and Five-lane Alternatives are unacceptable because they encourage high-speed travel through a residential area which includes eleven residential intersecting streets. 12- foot wide lanes and straightening of roadway are the wrong measures to take as they will create higher speeds, more air/light/noise pollution along with higher danger and fractionalizing of the Cottonwood Heights community.</p> <p>A desirable roadway through residential community includes no more than one lane in each direction with possibly a REVERSE LANE for BUS TRANSIT ONLY.</p> <p>Current and foreseeable future vehicular use does not warrant an expansion based on new commuter trends driven by Covid-19 pandemic, which includes virtual offices, incentives for workers to live near where they work, projected housing growth focused on the west and central valley, and a projected new business center located at the south/central valley area replacing previous prison space.</p> <p>More analysis is needed for: Pedestrian traffic across Wasatch Blvd. The effect of fracturing the approximately 10,000 Cottonwood Heights residents directly affected by a high-speed highway bisection their community. The egress/ingress lane design and associated roadway width on the additional six residential streets excluded from the LCC EIS.</p> <p>The solution to what is primarily a ski season problem, should include discouraging the use of private vehicles thru the use of tolls and/or increased parking fees and encouraging the use of free buses (subsidized by tolls/parking fees/resort participation and UTA).</p> <p>Of the three proposals described in the LCC EIS, I would prefer option 1 (enhanced bus/ no additional LCC roadway), then option 2 (enhanced bus/ widening LCC roadway - preferably a single reversible lane), and lastly option 3 (gondola)</p> <p>The only reasonable option for LCC is the enhanced bus service with no roadway expansion.</p>	robert jacobs	Website
5605	<p>It is asinine to believe that a gondola is actually a realistic way to move thousands of skiers. People will only use it at first because it is a trendy gimmick. Thereafter they will realize that it is a ridiculously inefficient way to transport people.</p> <p>The roadway expansion will negatively impact watershed and dispersed user groups like hikers, runners, bikers, and primarily rock climbers.</p> <p>Both options - gondola and roadway expansion will continue the decades old dismantling of wilderness quality in Little Cottonwood Canyon.</p> <p>Furthermore this EIS in general is frustrating to me. I have been studying and been involved with Wasatch land management and planning for a decade and it is really disheartening to see that this EIS just came down to three (only two of which are based in reality. The gondola is a pie in the sky joke) transit options for one 10 mile stretch of road.</p> <p>And not only that - the question you are asking is how can we move more people up the canyon? Why is that the question? We need to be thinking about this in a holistic manner - like watershed, wilderness quality, habitat, backcountry recreation. Transit for affluent humans in one canyon is really shortsighted.</p> <p>We must at some point realize that this canyon, and the Wasatch in general has a carrying capacity. Perhaps that means a lottery system or permits. But it is unreal to think we need to break it down to "travel time minutes" and traffic jams. These are mountains, not an LA commute.</p> <p>Add electric busses and stops at all trailheads/ parking lots. Incentivize people to park in the city or at the mouths of the canyons. Monetize resort parking for single and double occupancy vehicles. Limit development. Prioritize the forest, mountains, and watershed/ ecosystems. The future of the mountains is at stake.</p> <p>Thank you.</p>	Jack Stauss	Website
5606	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on the environment (according to information provided by UDOT). Once you remove this habitat, it cannot be restored. I dont think a faster 20 minutes is worth irreparably destroying the environment.	Joshua Pace	Website
5607	I support the gondola option with a base station at La Camille as the best transportation solution for Little Cottonwood Canyon.	Emmye Smith	Website
5608	<p>I personally would support the gondola option to keep traffic down and for a more Scenic relaxing way to get up the canyon</p> <p>I do not think enhancing the bus system without road side improvement will do anything. People will not use the bus if there is no advantage as it is time consuming, costs more, and is uncomfortable.</p>	Todd Keakey	Website
5609	<p>Enhancing the bus system with road side widening will incentivise people to use the bus system as it will provide a benefit, time saving. Match this with a toll for car uses or person count and i think we are headed in the correct direction. I also think reducing the cost per trip will increase usage and not limit the winter sports to high income earning families.</p> <p>Eliminating road side parking will be detrimental to non ski resort users such as back country skiers, snow showers, mountaineers and climbers. Trail head parking lots are often full by 7am on the weekends in the winter months. In the summer road side parking is sometimes the only option. Road side parking provides additional parking for the small trail head parking lots. If we do not have more bus stops or larger parking lots we will be limiting the use of the lands to many users.</p> <p>The Gondola seems like a good idea except the time it takes to get up the mountain and the fact there are not more stops at the trail heads. not to mention time spent getting on to the gondola. Doubling the time spent traveling will be detrimental to the use of this system. This seems very directed to only help the ski reports and not general mountain uses.</p> <p>I think a mono rail would be much more efficient in moving mass amounts of people in a shorter amount of time. Can we learn from Europe?</p>	Steven Senft	Website
5610	Do the gondola! Keep car traffic on the canyon to a minimum!	Matthew Chipman	Website
5611	As an Alta Ski Area employee who commutes up Little Cottonwood Canyon 5 days a week, I am very excited at the prospect of new transportation options. In my opinion a gondola is the best option in terms of minimizing vehicle traffic up the canyon. I am in favor of a gondola base complex at the LaCaile area. Any changes we make will be for the better, but let's do it right the first time and build a gondola.	Joe Amarante	Website
5612	Don't build a gondola or widen the road, it will literally destroy famous climbing areas in little cottonwood. You should just create a more efficient bus service.	Max Smart	Website
5613	Prefer the enhanced bus option 1	Jill Stephenson	Website
5614	Please do not build a gondola or widen the road. IT WILL DESTROY CLIMBING AREAS THAT I AND HUNDREDS OF SALT LAKE CITIZENS LOVE AND NEED. Just make the bus service or effective, that's probably way less expensive too.	Max Smart	Website
5615	I support the Alternative of Enhanced Bus and no additional roadside capacity with caveats as presented by the Salt Lake Climbers Alliance (SLCA). As a skier and a climbers, this presents the best alternative to getting skiers to the top with the least impact in the winter, and preserving access for a dispersed recreational use for climbers.	Hilary Silberman	Website
5616	I really like the tram from quarry plan. Good place to park and have some restaurants at the same time protecting our beautiful canyon and wildlife.	Paul Winter	Website
5617	Less is more. Moving more people up the canyons via gondolas will hurt the environment and pollute our watershed. More buses (unless they are natural gas or electric) means more pollution. Why not do something simpler such as fees for vehicle use (to encourage carpooling)? Widening Wasatch is also a disaster since drivers already go much too fast, plus it only benefits the road and construction industry. Look at what is best for our watershed.	Linnea Charnholm	Website
5618	we don't need any more people up in the Cayons this only destroys the fauna and forest in the Cayons	Berly Pena	Website
5619	I vote no in making any changes on the roads in fact the should regulate the# of people the we get up here and closed any trails behind our houses	Alfie Moralez	Website
5620	<p>My spouse and I stumbled over here coming from a different web address and thought I should check things out. I like what I see so now i'm following you. Look forward to looking over your web page again.</p> <p>MANDATORY Traction Control Rules should be in effect for all vehicles from November 1 to May 31. This might help prevent visitors from going up in a 2 wheel drive car, staying at a hotel, then driving down several days later in a snow event.....this has been a big problem.</p> <p>Also, to implement a toll tag system for both Little and Big Cottonwood Canyons,, which might encourage more carpooling. Thank you</p>	Andi Wieser	Website
5621	More Analysis needs to be don't on the impact on climbing in the canyon. How many climbing areas will be impacted for each of the plan. How many boulders will need to be destroyed if the lanes are widened. How much longer will hikes be if road side parking is eliminated. What about summer access how will hikers get to trail heads how many trail heads will be impacted by the creation of snow burns or snow sheds. Theses are all questions that have not even been considered or studied. What is the environmental impact of all of these options / having more people in the canyon in the first place. What is the impact on the back county's skiing access with the new plans. Why are the resorts not helping pay for something that is designed to solely benefit Them. Why is Wasatch widened from the north and not the south? What is the impact of noise to the houses on Wasatch with the widening ?	Marisa Cones	Website
5622	I want the enhanced bus service with no additional lane capacity. I am disgusted that an extra lane is on the table with the simple fact that half a million people get their water from the canyon, and it will endanger the watershed. I do not think the gondola is a good option either. The gondola will not solve the traffic problem, as traffic is going to be the exact same with a gondola.	Megan Sieverts	Website
5623	I strongly believe the Gondola is the best solution for Little Cottonwood Canyon. Please do not widen the canyon road. The gondola will provide visitors a scenic and much more enjoyable way to access the canyon, plus it won't add to air pollution. Gondola makes all the sense in the world!	Stephen Alfandre	Website
5624	I am in favor of the enhanced bus service with no additional lane capacity. I do not want an extra lane or a gondola to deface the canyon, and put the watershed in danger. I hate that a road building entity was tasked with the future of the canyon. I do not want an additional 100 parking stalls at Red Pine. Save the natural space we have please.	Molly Sieverts	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5625	<p>My name is Martin Ritter. I am the CEO of Stadler US Inc., a passenger rail manufacturing company located in Salt Lake City. I noticed with great concern that a train was not part of the proposed draft alternatives for Little Cottonwood Canyon. Passenger trains have many benefits over the proposed options, especially for mountain transit. Therefore, I hereby urge you to reconsider the draft alternatives to include passenger rail as an option. Below my concerns and suggestions:</p> <ul style="list-style-type: none"> • All alternatives should be treated equally with similar O & D's • Rail is the best long-term, year-round, environmentally conscience solution • Rail is the most cost effective alternative to road traffic and has best Life Cycle Cost of all proposed solutions • Life Cycle Costs should be included and considered in the report • Envision 1 train every 15 min vs a bus 2.5 min vs a gondola 25 sec • Train is most consistent with core canyon values • Rail has the greatest potential for a one seat ride from Airport/Downtown • Rail has highest carrying capacity per hour with multiple stops • Buses and trains can more easily adjust to demand • Evacuation of aerial gondola is dangerous and complicated, slow evacuation in case of emergencies • Gondola may be crossing over wilderness boundaries • Buses and trains are able to easily stop mid-canyon for other uses • A Cog Train can be built adjacent to existing road 	Martin Ritter	Website
5626	<p>Thank you for re-considering passenger rail in the draft alternatives for Little Cottonwood Canyon. More bussing would be the solution given the cost, including negative visual and environmental impacts.</p>	Carie Johnson	Website
5627	<p>I am in favor of enhanced bus service with no additional lane capacity. I do not want the road widened or the gondola. I want to protect the watershed and the natural spaces we have. I want the canyon to still be here for my children. I do not want it to become nothing more than a means to get to the ski resorts. Please buses only. I also do not want extended parking at Red Pine because it is by the watershed. I am okay with the additional parking at Lisa Falls IF it is on the opposite side of the road from the watershed.</p>	Megan Anderson	Website
5628	<p>It seems clear that all of the alternatives favor continued growth and expansion of LCC usage. I believe all of these alternatives should be shelved until serious options that consider limiting canyon use and puts preservation of the LCC environment and natural condition to the forefront. ALL of the presented alternatives add significantly to the cumulative effects that urbanization and unrestrained growth continue to place upon Wasatch Front canyons. It appears that this decision process is being driven by forces that care little about the intrinsic value of LCC and instead favor politics and non-sustainable growth.</p>	Rodger Renstrom	Website
5629	<p>I REALLY like the idea of a Gondola, makes total sense.</p>	Murray Gardner	Website
5630	<p>I strongly support the Gondola option because it will preserve the beauty and serenity of the canyon, in my opinion. I strongly support this Gondola option!</p>	Callie Alandre	Website
5631	<p>As a climber, skier and recreationalist in Little Cottonwood Canyon, unfortunately the only proposed plan that makes sense is enhanced buses with NO roadway extension. The ability to disperse in the lower and middle areas of the canyon are necessary for climbers and hikers alike. Additional road capacity will destroy some on the iconic climbs in LCC. Skiers need to have the ability to backcountry ski which the gondola gives no access to. Thank you.</p>	Galen Graham	Website
5632	<p>It is difficult to make an educated decision based on the small amount of information provided here. I support the proposal which has the greatest ROI in the sense of moving the most people up the canyon with the smallest environmental impact.</p>	Kyler Booth	Website
5633	<p>As someone who frequents the canyons for both backcountry skiing and rock climbing, I support the initiative with bus service that does not include widening the roads--key rock climbing would be eliminated and this accounts for a substantial amount of recreation in the canyons and needs to be taken into consideration. There are other ways to maximize efficiency without expanding the road. One possibility is to limit canyon traffic to buses only on weekends with relevant stops throughout the canyon and expanded park-n-rides. None of the options currently proposed by the department will solve the canyons traffic issue unless car traffic is restricted during peak hours in some capacity. If people have the option to drive, they will.</p>	Sarah Garcia	Website
5634	<p>I think a gondola makes the most sense for our community! I would use it every time. Enhanced locker areas at the resorts would also help with usage.</p>	Guinn Ellen Dunn	Website
5635	<p>I choose the gondola option.</p>	Kay Kelly	Website
5636	<p>go with the gondola and parking in LaCaille</p>	Sally Oneill	Website
5637	<p>I oppose all of the draft alternatives in this EIS. The massive expenditures of government resources to benefit the private owners of Alta and Snowbird ski resorts is wrong. There is no valid economic justification for it, while also they all would result in degradation of the water quality, air quality, visual experience and overall enjoyment by the public of LCC. Although UDOT currently spends tax payer monies to build and maintain SR 210 as a year round road whose main beneficiary is Alta and Snowbird, the total amount of economic benefit they produce to the state is a small fraction of the total ski industry in Utah, and none of the draft alternatives will change that. The major ski industry economic benefits are produced in Park City due to the expansive lodging, restaurant/bars, entertainment and other associated businesses located there driven by out of state destination visitors. That will never exist in LCC. These draft alternatives amount to an unjust enrichment of the owners of Alta and Snowbird by the taxpayers and will not enhance their economic contribution to the State of Utah, while causing ecological and environmental damage to LCC.</p>	Dave Barry	Website
5638	<p>I support the Gondola option - do not make the road wider, add more buses, etc.!</p>	Rick Nemeroff	Website
5639	<p>I support enhanced bus services without roadway widening. Shoulder parking is valuable to year round users of LCC when official parking lots quickly fill up. I frequently use it both in the summer for climbing and in the winter for backcountry skiing. I would be receptive to paying a toll during peak hours, but it should be better implemented than the Millcreek toll (this one sees far less traffic and already gets backed up). To be frank, I think the gondola will be an eyesore in the canyon, and does not address the concerns of non-resort or summer users.</p>	Cheryl Liu	Website
5640	<p>I support the comments submitted by the Salt Lake Climbers Alliance in that any actions taken should take steps to mitigate impacts to the rock climbing areas in LCC. I believe the road widening option seems the best to alleviate winter traffic, but I am very concerned about the potential impacts to the Gate Buttress area. The gondola alternative seems to have the most impact on climbing areas, so I would advise against choosing that option.</p>	Mike Heinz	Website
5641	<p>As an Alta Season Pass holder - I support the plan to build a high-speed, high-capacity gondola eliminating the need for road widening, buses and the tunnels, and including a toll for private vehicles traveling up the canyon. I understand an option to go to a garage near Le Caille - this is even better - let's do it!</p>	Corey Freeze	Website
5642	<p>As long as the gondola option is being changed to include parking at the gondola base station and that there are provisions to limit the number of skiers each day at Snowbird and Alta to prevent over crowding of the slopes I am in favor of the gondola. If these changes are not made then I am in favor of the bus option with bus lane.</p>	Tom Finley	Website
5643	<p>I would prefer the enhanced bus alternative - as a hiker and rock climber, access to roadside parking and climbing is essential to my family's enjoyment of the canyon. No matter the ultimate decision, please consider access for rock climbers.</p>	Devan Romano	Website
5644	<p>I support the gondola option. To address more issues, I think an extension to BCC and PC should be considered as well</p>	Christopher Hall	Website
5645	<p>I'd like to advocate for the gondola option.</p>	Emilia Wint	Website
5646	<p>Although more expensive, I feel a gondola system will be more environmentally friendly and it will draw more tourists to enjoy our future forward community.</p>	Sarah West	Website
5647	<p>100%, without question, the gondola is the best option or we'll be having this same debate again in 10 years.</p>	Greg Lentine	Website
5648	<p>Hello! I think that none of these three solutions will successfully alleviate the very real issue that is traffic congestion in LCC during the winter. While that is certainly a problem that merits investigating, I think this study has not gone deep enough into the impacts that any of these solutions will have on LCC as a whole. As an employee of Alta Lifts Co. I deal with and recognize the traffic on a daily basis. That being said, I also use LCC extensively as a climber. With all three of these proposed solutions, I am most worried about how this will affect access to the world-class granite climbing. I would like to see a deeper study on which climbing areas would be impacted by road-widening and/or lift towers for a gondola. Please investigate further and don't rush to a solution that will maybe help in one way (winter traffic) but hurt in others (by affecting the climbing and hiking that LCC has to offer also). Thank you for your time. With concern, Adrian</p>	Adrian Martino	Website
5649	<p>Dear Utah Department of Transportation,</p> <p>I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. 5650	<p>I moved to Utah for the central wasatch range and all it has to offer. I have been a season pass holder to multiple resorts, now exclusively backcountry ski/ski mountaineer, run and climb every summer, and now have 3 children who are growing up with the wasatch as their backyard. I/we are in the major canyons weekly. My comment is this: People over profit. To all of us who are submitting heartfelt and thoughtful comments, the Cottonwood Canyons and beyond are HOME. The real magic of this place is the land and snow itself, that it is so accessible, AND that you know the lifie and see friends at the trailheads. My kids will not have the same great experiences I have had. IKON has destroyed what was good, let's not make it worse. We reject the gondola and especially the potential for resort interconnect. To many reasons to list here. We support snow sheds, enhanced (and incentivized!) bus service. As a family with small kids, at this point in time need the car but will take alternative forms of transport as soon as feasible. Road widening and flex lanes while not desirable, are better than the alternative. We need access for non-resort users. We reject the notion of a toll. We can barely afford it as it is.</p> <p>Sincerely, Parker, Carly, William, Gwen, Solomon</p>	parker chapple	Website

5651	While I appreciate the need to change the situation in Little Cottonwood, this proposal has only marginally-effective options, and one of these is ridiculous. The concept of a Gondola is absolutely out of the question. You've taken the bus ideas and made something even less effective as the option to consider. Let's take that off the table. It's ineffective, will forever blight the view of the canyon, and the crowding will be virtually unaffected due to the extremely limited capacity of the Gondola. The bus options are at least not going to have a "forever" impact on the canyon view. How about expanded bus pickups for the ski buses along the I-15 corridor along with the bus options, including building a parking structure there? Also, none of these options will be effective without a plan to motivate their use (including enforcement of carpooling, proper vehicles, etc.). Again, it's good to see UDOT considering options to lessen the congestion issues on the road to Snowbird and Alta, but the options presented in this proposal definitely seem to be lacking, and in one case outright ludicrous. Please, no gondola.	Vincent Romney	Website
5652	The gondola sounds like a really stupid idea. Its a ploy to get the one wasatch thing started. Next thing we know alta will be building a lift through grizzly glutch to solitude. While widening the road also seems like a bad idea. Maybe serge pricing toll and closing the road to one way at key times so the bus has its own lane. Or getting rid ofvthe ikon pass	Cade Nielson	Website
5653	I am 76 years old and have never skied nor at my age do I ever intend to. We moved to Utah 25 years ago from Oregon which is known for it's coast and mountains. It didn't take me long to determine the real treasures of Utah are it's National parks and it's canyons, in particular it's ski resorts. Even though I don't ski, I have numerous friends and family visit for the specific reason to ski. Little Cottonwood canyon has been their favorite destination. I am aware of the traffic problem that has existed for years and am happy that it is finally being addressed. I have reviewed the three proposals to solve the traffic problem in the canyon and am in favor of creating a gondola base station at the bottom of the canyon to transport those wishing to ski or just experience the majesty of our mountains. I think it is the option that makes the most sense to reduce the traffic and promote the most safety. I think the costs should be born by a private and public participation which would be the least expensive of the options for the tax payers. Thank you for your the opportunity to express my opinion.	clair price	Website
5654	While traffic and reducing it should be paramount, and allowing access to everyone to these amazing lands, these changes do nothing to benefit the Wasatch except these two ski resorts. When will enough be enough, the resorts have already expanded beyond what they should have, and are already putting our water shed, our recreation abilities (unless you can afford to pay their prices), and the health and vitality of our forests and eco systems at risk. This more, more, more and more greedy development approach is killing this state, the planet, and us. The alternative that should be enforced is no more development, period! Appreciate what you already have! and take care of it! The resorts should be concerned with quality, not quantity!	Carla Tuke	Website
5655	Expanding a traXlight rail to the base of the canyons would be of greater benefit to the visitors of the canyons as well as to the rest of the public at large, encouraging less car traffic all around the valley while increasing availability and access, no need for more parking lots. That is a win win for everyone - reduced pollution valley wide. IT is obvious that the Gondola is just a ploy to begin to push forward the interconnect of the resorts, it will not solve the traffic problem in any way, but will increase it. The only benefit I can see is it will allow the resorts to charge more money for people to be able to enjoy the beauty of the canyon, with this new RIDE, which is really all the resorts seems to be concerned with - increasing their profits! Everyone else and the environment be damned!	AJ Anderson	Website
5656	I am in favor of the enhanced bus service with no additional lane capacity. As a rock climber I am very opposed to the additional lane and the gondola. #1 Choice: Building a high-speed, high-capacity gondola eliminating the need for road widening, buses and the tunnels, and including a toll for private vehicles traveling up the canyon.	Matt deRosier	Website
5657	Allowing for add'l ski resorts along the Wasatch Front could also help alleviate congestion up BCC & LCC. Our state continues to grow but we have the same number of ski resorts. After studying the 3 transportation options for LCC, I feel the choice of the Gondola is the best!! Thank you for considering the options to alleviate congestion and preserve Little Cottonwood Canyon. There are few places in the world as beautiful. We in Utah are so fortunate to have this gem in our backyard. The memories of spending time recreating in LCC are very special. The Gondola will be spectacular and will add to those memories while reducing harm to the natural environment. Please put the Toll Booth in immediately. The privilege of experiencing the canyon will be with every penny.	Jamie Peters	Website
5658	Hello. Are we evaluating the possibility of a rail/train solution to help decrease congestion in the canyon? Having spent over 10 years living in mountainous parts of Europe I have seen how efficient and convenient the trains can be to move passengers up and down the mountains. Utah is now my home, and I sincerely hope we can find the right way to allow people to enjoy this beautiful region. It is also important to me that the solution be minimally invasive to the nature in the canyon. I do think this could be feasible with a rail solution and I also would venture to guess that the carbon footprint would be comparatively low. Therefore I ask that at the very least we evaluate a rail/train solution as a viable option.	Brett Huras	Website
5659	My vote is for the Gondola Option	Richard Willis	Website
5660	The Gondala seems to provide the minimum disruption to nature. Should only charge on the weekends to drive up	Thomas Keeler	Website
5661	I am in favor of the enhanced bus service with no additional lane capacity. I do not want the road widened. I am concerned with the watershed already being so close to the road, and I do not want to carve away the little natural land we have left. I also do not want a gondola up the canyon. The gondola could also threaten the watershed and leave a large environmental footprint.	Alex Anderson	Website
5662	Heavily support the gondola option. Would also support gondola from Park City area.	Lee Porfer	Website
5663	Gondola seems like best long term option for offering access responsibly.	Elizabeth Finlinson	Website
5664	I support the option of more buses plus adding flex lanes for buses (which could be used by cyclists in the summer). I think this is the best option to reduce the traffic long term. I would gladly ride the bus more often if I could be assured it would not get caught in traffic. I think increased busing, if not mandatory busing, is the best option for improving traffic in the canyons. The alternatives strike me as too disruptive to the beauty and ecology of our canyons.	Robert Scott	Website
5665	With increased busing, we need a dramatic increase in service, as well as new and or expanded park and ride locations. The limited park and ride locations increases the sense that the buses are crowded and unpleasant experiences. I can speak first hand that it's really frustrating to have waited a long time only for there to not be enough room on the bus for all those waiting or for the bus to arrive already full. Additionally, steps should be taken to ensure that the buses have better options for gear storage than the current buses. The current buses themselves are part of the problem.	Eleanor Gilmore-Szott	Website
5666	Train transport is the most clear solution to both environmental and convenience solutions. Why has this not made. Comeback asbthings have evolved? This is the one mode that is the most inexpensive, green and convenient for consumers. Please look into it.	Susan Paskett	Website
5667	I'm in favor of Gondola and La Calle base station for Little Cottonwood Canyon. Widening roads is not a long term solution. Thank you for considering options to improve the reliability and safety of transportation on SR 210. I am writing in favor of the alternative to enhance bus service with no additional road capacity. Increased bus service is a change that can be made immediately and with minimal impact to reduce the number of cars in Little Cottonwood Canyon. In addition to increased bus service, I strongly support tolling of cars driving into LCC, with incentives to carpool or use public transit.	Brynn Perkins	Website
5668	Road widening is an option that could potentially be considered in the future but should not be implemented ahead of proper environmental impact studies. Similarly, I oppose the development of snow sheds due to the destruction of natural beauty that will occur. However, should this option be pursued, environmental impacts including erosion risk and water quality should be analyzed ahead of moving the project forward. I strongly oppose the development of a gondola under any circumstances given the destruction it will cause to the natural beauty and environment of Little Cottonwood Canyon. However, if UDOT is ultimately chooses to pander to Ski Utah and put the gondola in, please be smart enough to put the parking right at the gondola base. Having to ride a bus to the gondola is the silliest idea I've ever heard. Finally, I think it is important to highlight the limited scope of this EIS. Changes made to LCC will have rippling effects throughout the Wasatch and it is vital to take these downstream effects into consideration before moving ahead with any plans specific to SR 210. Thank you for the opportunity to comment.	Colleen Rock	Website
5669	The bus option with no road widening and no gondola is the best of the options for sure. Dear Utah Department of Transportation, I am a backcountry skier who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.	Isaac Acosta	Website
5670	As you know, LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.	Clayton & Sherry Wilkinson	Email
5671	As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution). Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. Sincerely, Mr Clayton and Sherry Wilkinson	Peter Floodman	Website
5672	I am a regular user of the Cottonwood Cyns and frequent Season Ticket holder at Snowbird and Alta since 1972. I believe the best option is the GONDOLA. It makes the most sense given the tourism we accommodate from around the world. Salt Lake is an international destination year around and this 8 mile Gondola through the majestic granite walls of Little Cottonwood Canyon will only add to the world class environment Utah has created for everyone to enjoy.	Zachery Robarge	Website
5673	Please do not put in a gondola and please do not widen the road. Run more busses if that's your prerogative bit please don't defile the canyon	Kevin Brower	Website
5674	I vote no for a gondola. Why is a 3 lane road not being discussed?! During peak hours have 2 lanes up and during peak hours 2 lanes down. Or how about a test season doubling the amount of busses and see how that goes. If everybody is on a bus then by definition there will be less cars and less need for any of these changes. Let's see some data of actual completed projects that have solved the problem else where. For example the unused Draper traX line.	Sheryl Ipsen	Website
5675	More Buses only please, no widening of roads. Small amount of the year that sees intense backups!! Thank you!!! Increased environmental impact for the benefit of two ski resorts and their continued increase in profits doesn't make sense. Do away with the ideas of a gondola or widening the road. We climbers use the area year round while skiers only use it for a few months out of the year.	Mateo Weisgal	Website
5676	I think expanded buses are the best answer provided. I absolutely do not want to expand the roads as I feel it is unnecessary and further reduces our wild spaces and the habitat available for a variety of species. Gondolas are an abhorrent idea and waste of resources. If we want to spend money on something, lets get more buses and make them electric.	Andrea Parrish	Website
5677	Go with the gondola subsidized by tolls on private vehicles.	Jeff Gaufin	Website
5678	Why not put a train to and from the resorts?	Jesse Timmerman	Website
5679	I support the high speed, high capacity solution to traffic mitigation in LLC. Having traveled extensively in the mountain ranges of Europe, I have seen first hand the efficiency and traffic reducing effects of lifts like this.	Barry Woods	Website
5680	Kudos for all the work on a difficult project! Should have had snow sheds decades ago. Should include snow sheds with the gondola option. I'm concerned the enclosed gondola will be stigmatized for years even though covid will pass some day. A normal flu/cold season is deterrent enough for riding the Snowbird tram. Based on these options I'd go with road widening and enhanced bus. Also, anyone that held any government position for the past or future five years (Elected or paid) that worked on any of these proposals in any way must be banned from profiting financially, in any way, from any land or development transactions associated with the final project selected. If conflicts arise those individuals must donate any profit, in excess of audited/competitive labor & materials towards reducing the tax payer portion of the project.	Robert O'Neill	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5681	I am very concerned that the EIS does not adequately analyze the impacts of the transportation proposals on dispersed recreation, especially in the lower portion of LCC. I'd argue for more analyses of the buses/shuttles and NO roadway widening. Why can't we have huge parking garages at the bottom and great shuttle systems up and down? Buses would have the least impact on the lower cottonwood canyon and on climbing--a growing sport! This proposal would have the least impact on the climbing resource with the information currently provided by UDOT.	Stacy Bare	Website
5682	Please spend some time with the Salt Lake Climbers Alliance who continue to advocate for year-round dispersed recreation access to climbing resources with transit solutions that accommodate appropriately for traffic safety as well as current and future access to climbing resources. Growth trends in climbing as a sport are increasing as is the use of outdoor climbing resources in LCC. This use needs to be appropriately considered in UDOT's Alternatives. I would love to see the gondola option and make traveling in the mountains more efficient.	Allison Aafedt	Website
5683	As a climber, skier and year-around user of LCC, I support the Salt Lake Climbers Alliance comments on the draft alternative plans for Little Cottonwood Canyon. Enhanced service, without roadway widening, would be the least impactful proposal. However, there are still lots of analysis needed to consider dispersed recreation in this area.	Eric Wynn	Website
5684	Thank you, Eric Wynn		
5685	Gondola option looks like the best option visually, impact-wise, and presents the lowest COVID-impact. I believe the best way moving forward is to increase both bus services and provide more and better strategic parking lots. My interest is to see the least environmental impact in the mountains. Please do not make money the motivating factor for decisions that will impact generations to come. The natural environment is one of our greats assists in the west. Protect it!	Garrett Long	Website
5686	I echo the comments from the Salt Lake Climbers Alliance: I support the Alternative of Enhanced Bus and no additional roadside capacity, with caveats (#1-14 below), as this Alternative would have the least impact on the climbing resource with the information currently provided by UDOT. Overall, any Alternative needs to carefully consider dispersed recreation, especially in the lower part of Little Cottonwood Canyon. The climbing areas in the lower portion of the canyon are heavily used throughout the year and the Alternatives will potentially negatively affect the user opportunities, user experience, and environment.	Anne Wolfer	Website
5687	A rail line would be the best multi passenger/multi stop option. It would also be a good year round option.	Hayden Bove	Website
5688	I support the Alternative Enhanced Bus - no additional roadside capacity option. Capital costs are low and it has the least impact to the climbing areas in Little Cottonwood Canyon. The Gondola would be an eyesore while being outdoors in the canyon. High winds could impact the gondola's frequency and any rescue efforts to the gondola (if it were to breakdown) could be logistically difficult.	Joe Kennard	Website
5689	I am very concerned about your proposed expansion of Wasatch Blvd. As a resident of the top of the world neighborhood, I live 1 block in from Wasatch. Increasing the number of traffic lanes for cars will increase noise and air pollution and make leaving my neighborhood very difficult. I leave from kings hill drive and turning left will be dangerous and impossible if additional car lanes are added. Straightening Wasatch will encourage commuters to travel at higher speeds which is the opposite goal for our area. Reducing speeds, providing ample opportunities to encourage bus use and safe areas for walkers, joggers and bikers are top priorities for the residents of our community. Widening roads through our area will not improve ski traffic because the road eventually narrows to a one lane road going up each canyon. This will only serve to allow more commuters to idle right outside of our neighborhoods on high ski traffic days. What we need to do is only add a bus lane, safe bike lanes and a multiuse lane for pedestrian use. I strongly oppose the adding of additional car lanes. I moved to this area 5 years ago. The homes in our neighborhood will greatly suffer a loss in home value by putting such a large freeway through our neighborhood. The widening is unnecessary and harmful. Please reconsider instead of bulldozing your idea forward. Please stop for a moment and consider how you would feel if this was your home. Also ask yourself why you are doing this and why do you think this is needed. We need to focus on walkability and preservation of our neighborhoods. Cottonwood heights is about nature, outdoor recreation and community. Putting a giant freeway through town is divisive, dangerous and harmful and the opposite of what our community needs.	Tullivan Begay	Website
5690	I was surprised to see a rail system was not considered as a proposal. A rail line would allow greater flexibility on stops compared to a gondola and may eventually allow for a connection into the rest of Utah's light rail system allowing for seamless travel across the Wasatch area.	jennifer nazzaro	Website
5691	I support Enhanced bus with no additional roadside capacity. This would have the least impact on the canyon, and on other canyon users. It must be combined with limiting the number of cars allowed up the canyon during peak ski days. No point having the bus service if personal cars are not limited on peak days	Anne Weaver	Website
5692	I'm in favor of the second option. Widening the canyon road, adding dozens of buses, constructing over half-a-mile of concrete tunnel "snow sheds" and adding a toll for private vehicles. I think there sheds should be fast tracked.	Wendy Jenkin	Website
5693	In reviewing the three proposed alternatives, the Enhanced Bus without additional road capacity seems to provide the most benefit for least cost and environmental disruption. - allows for a step-wise process through incrementally growing bus capacity - increased capacity can start now rather than years from now - bus stops can be flexible, serving other canyon uses besides the two ski resorts - provides year-round service, rather than winter only gondola - lower visual impact vs adding gondola towers - peak period shoulder lanes can be added in the future as needed	Nick Stearns	Website
5694	My over all comments about the LCC transportation project. - should serve all canyon users not just the ski resorts - should provide capacity year round (the canyon is heavily used in the Summer) - buses should be electric (zero emissions, adding capacity shouldn't come at the expenses of adding emissions) - users should pay, including out of state visitors (resort fees, tolls, etc) - questions about how snow sheds will impact backcountry ski access in the winter and biking, and hiking in the summer As a resident and frequent user of the Cottonwood Canyons, I am in support of enhanced bus service without roadway widening. However, I have not seen any options that fully address the problem.	Brock LeBaron	Website
5695	The gondola and road widening proposals represent a HUGE expenditure of taxpayer money, before we have implemented simple, low hanging fruit solutions. Reducing cars/ traffic in the canyon will require a) additional parking near the mouth of the canyon b) enhanced bus service throughout neighborhoods and hotels that connects to the ski bus and/or c) tolls for cars that use the canyon roads. Given that it is currently free to drive and costs money to ride the bus, it is amazing that demand for the bus STILL far outstrips supply, and people are left waiting for several buses to go by before they can get on during rush hour. If we provided adequate bus service, and incentivized people to use the buses rather than drive, that demand would continue to increase.	Jen Wulf	Website
5696	This is a huge mistake and will ruin the character of the neighborhoods and only increase traffic in the surrounding areas and bring MORE people into the Canyon. The reality is the canyon is finite - and so should the number of people be that are in it. You businesses and associated trade groups that think you can expand indefinitely or grow revenue indefinitely should have thought of that before you chose a business that isn't scalable and this is on in a finite area. You are not Walmart or Amazon. Deal with it and leave the canyons find their equilibrium and stop trying to shoe horn things in. You and your bullshit are putting the putting the last straw on that will ruin this precious wilderness but you don't give a damn.	Ed Jones	Website
5697	I prefer the Gondola option I am a lifelong resident of Utah - born here in 1950 I am FOR : MORE BUSES and NO lane widening. I am AGAINST - gondola (NO WAY) - lane widening	Nancy Sefakis	Website
5698	If we simply invested less than a quarter than is being proposed in some of these options, \$50 million to \$100 million in buses, transitioning 50-70% of the people out of their vehicles and onto transit well before the mouths of the canyons; if we altered behaviors by not allowing cars to line up, implemented a toll that encouraged 4 people per vehicle, ticketed vehicles for having ill equipped tires, and enforced no roadside parking as should have been done years ago -- we could make a bigger dent in the dreadful traffic woes caused by cars and would have to build nothing more in our canyons. Give it an earnest 5 -10 years, actually funding it like you want to solve the problem. We can continue to investigate long term solutions in the interim. All we know for sure is that the options before us right now, completely fail the users and the environments in the Wasatch, destroying the values that make this place special. Your truly, Harold Carr Ph.D.	Harold Carr	Email/Website
5699	I support the Gondola Plus La Caille Base Station alternative as the most fiscally sound, forward-thinking, long-term and innovative solution to the traffic challenges presented in Little Cottonwood Canyon. The La Caille Base Station will further enhance the benefit of less congestion, pollution and overall traffic within Little Cottonwood Canyon and further mitigate the need to widen roads. The other alternatives that include wider roads, more cars and more busses will only serve to enhance the same problems we have today. On snowy days we will still have traffic jams, but with more cars, more busses and more pollution. In 10 years, as our population increases, we will all be engaged in this same discussion again if we don't look further ahead and make the best, long-term decision today. Utah should be a state that embraces transportation innovation. Any state or country can blow up canyon walls to lay more concrete. Any state or country can widen roadways and accept increased noise and air pollution as the new status quo. Any state or country can choose to ignore the fact that roads will never be wide enough. Utah, with its silicon slopes nearby, should lead the world in transportation innovation, beginning with access to its world-renown Wasatch Mountains. I support the Gondola Plus La Caille Base Station because it's the only plan that looks beyond the next decade. It embraces transportation innovation and looks 50 years ahead, allowing for fiscally sound and environmentally safe continued growth.	Matthew Irwin	Website
5700	The enhanced bus with NO additional roadway capacity is the clear winner for the best ROI. It provides a relatively equal capacity to the other options, while being the least expensive for capital costs. This option also does not sacrifice accessibility to summer activities in LCC. Expanding the road would take away side of the road parking which is helpful for accessing various parts of the canyon. My only hope is that the summer/fall recreation activities are also considered when deciding on the plan.	Wolfgang Morlock	Website
5701	Please do not widen or work on the road do not destroy our nature!	Elizabeth Tronstein	Website
5702	I support the enhanced bus with road widening option. This makes the most sense for avalanche control, the local community and the ski areas. Support Enhanced bus with no additional roadside capacity. The other options are too expensive and too damaging to the canyon. During peak periods the LCC road could be run like a toll road, with the cost per vehicle high enough to discourage driving personal vehicles up the canyon. The bus should be free or minimal cost, financed by the toll road.	Stewart Middlemiss	Website

5703	Please protect recreational opportunities by pursuing expanded bus service, BUT do NOT expand Wasatch or LCC.	Mark Shah	Website
5704	After reviewing and as a resident of big cottonwood canyon, I like the gondola option. Might be more expensive in the short run but perhaps less expensive on the long run	Dan Schlehube	Website
5705	<p>Hello,</p> <p>I am writing in reference to the three options outlined in the Little Cottonwood Environmental Impact Statement. I have spent 30+ years going up and down the Cottonwood Canyons, both in winter and summer and am in total agreement that something needs to be done to reduce the congestion, especially during tricky winter conditions.</p> <p>Of the three options, I prefer Alternative 1 (Enhanced Bus Service) the most and Alternative 2 (Enhanced Bus with shoulder lanes) as a back-up. I think that Alternative 3, the gondola, is a very poor option for numerous reasons. Gondolas have worked well in places like Verbier and Courchevel in France, but the Wasatch is a much different situation. In these two areas, the gondolas are free, run almost all day long, year around and connect lower and upper civic centers. In both cases, it is faster and easier to take the gondola as it is a direct, straight line up the mountain verses a narrow twisty road with many tight switchbacks. In the case of the proposed LCC gondola, it would run parallel to the road and be slower than a car at best and much slower when you factor in the parking and transfers, especially if you have a family with all of their ski gear. I didn't see any ridership cost estimates, but if it is anything like ski area gondolas, a ride of that length will be expense and unlike packing more riders into a car, there will be no economy with a larger group size.</p> <p>Thanks for all of your thoughts and efforts, Andrew McLean</p>	Andrew MacLean	Email
5706	Please choose alternative 1. People still want to be able to enjoy the canyon who aren't going skiing.	Melanie Brun	Website
5707	I support enhanced bus service, with or without additional lanes. I oppose gondola is it will impact the scenic nature of the canyon. Please consider access to boulders and climbing areas in considering proposals	Greg Radin	Website
5708	<p>Hello my name is Dan Barrell, I really appreciate the opportunity for taking public comments and for your hard work on this process.</p> <p>Having reviewed the transportation alternatives and after putting a lot of thought into the feasibility, cost/benefit and environmental considerations I am pleased to share my thoughts with you.</p> <p>The only feasible options are the alternatives involving additional buses / enhanced buses. I am EXTREMELY OPPOSED to the gondola option on several grounds.</p> <p>The Gondola is extremely limited in its functionality as it can only serve the two resorts, thus completely eliminating the possibility to serve the entirety of the canyon (including hiking trails). It also is EXTREMELY SLOW. The only rare occurrence when it would be faster is on the very few mornings of avalanche control, which the avalanche sheds could mitigate against. Because it involves multiple steps (bus to gondola station) and due to the long travel time, very few people will take it in the winter or summer and would favor cars. It thus would not solve the problem of traffic for its staggeringly high cost. Because it can't stop at trails it would do nothing to minimize traffic in other areas of the canyon. The gondola would destroy the character of the canyon, by forcing a large obtrusive infrastructure in the middle of the canyon and ruin the natural character. This infrastructure with its staggering price would only serve the ski resorts and would be a handout to them. If this option is selected Alta / Snowbird should be required to pay for 100% of the cost, NO PUBLIC FUNDS SHOULD BE SPENT ON A GONDOLA!!!! As Alta is publically lobbying for a Gondola, if this option is selected, there needs to be a comprehensive audit of UDOT to determine whether Alta exercised undue influence on the process.</p> <p>The bus service can be nimble and ramped up and down for future needs and provides greater optionality. I think the bus travel time could be even more reduced if each resort just had one bus stop on the side of the road, where passengers disembark the UTA bus and are driven by the resort bus / outdoor shuttle to the front of the resort. This would minimize the cycle time and allow for fewer buses to serve more passengers. It would also offer the possibility of regular buses (every 10 minutes).</p> <p>All the public I've talked to are extremely opposed to it and I am confident UDOT will arrive at the conclusion that enhanced bus service is the only alternative that should proceed (unless undue influence from business interests was prioritized over citizens who will pay for it).</p> <p>Thank you so much for your hard work and for engaging the public.</p> <p>-Dan Barrell Salt Lake City</p>	Daniel Barrell	Website
5709	I really agree with the enhanced bus idea. However, I am skeptical of widening the roads in and around the canyons. If the idea is to have less cars in the canyons, bigger roads are the antithesis of that! Let's invest in public transportation infrastructure so that all of this construction nonsense IN THE CANYONS is not necessary. These canyons are also the home of many species besides our own, and to not take that into consideration is a huge mistake.	Patti Hobfoll	Website
5710	I really agree with the enhanced bus idea. However, I am skeptical of widening the roads in and around the canyons. If the idea is to have less cars in the canyons, bigger roads are the antithesis of that! Let's invest in public transportation infrastructure so that all of this construction nonsense IN THE CANYONS is not necessary. These canyons are also the home of many species besides our own, and to not take that into consideration is a huge mistake. What about building out the Trax system to travel up Wasatch Blvd?	Ari Hobfoll	Website
5711	The high capital cost of these alternatives raises the question of whether the cost / benefit of these alternatives is sufficient to justify their construction. We are talking \$0.5Billion over 10 years, especially considering the likely cost overruns. Are there not already enough people up at Alta and Snowbird?Where are the cars going to be parked? For these reasons, and the overall impact, I would support the lowest capital cost (buses) because these are most easily expanded, and give greatest scheduling flexibility. The key is to limit use of private cars, and encourage the use of buses from further away than the immediate base of the canyon.	Miranda Menzies	Website
5712	After reviewing the options, I would prefer the Enhanced Bus Route without widening the road. I believe this will have the least environmental impact on the land. Additionally it would be not contribute to the poor air quality, if the buses could run on natural gas, electricity, or some sort of hybrid. Thank you!	Angela Mason	Website
5713	Gondola is by far the superior option	Kyler Roush	Website
5714	Gondola 100%	Tim Shaw	Website
5715	I would like to see a tram/gondola system along with road widening/improvements including the tunnels. I do not agree with a toll system, especially for those of us who own properties and timeshares at Alta and Snowbird. There needs to be some system in place that allows those who are paying a substantial amount of money to stay in the canyon for weeks at a time to have a pass that allows access, without having to pay even more money if we travel up and down the canyon for various reasons.	B. Ririe	Website
5716	An immediate transportation solution for LCC is needed. The enhanced bus service with increased parking lot capacity seems like an obvious solution as it could be implemented as soon as this winter. Another consideration could be: One way uphill traffic in the peak morning hours on weekends, holidays, and powder days (7-8 or 8:30am perhaps). Also, snow sheds must be part of any bus option solutions. Finally, a gondola option should ALSO be considered for the near future. It seems silly to have an all or nothing proposal-buses vs. gondola. We should have BOTH as the popularity of skiing and hiking in the Wasatch is growing and will continue to increase as the local population and tourist traffic continues to grow.	Victoria Gorman	Website
5717	<p>Thank you for taking the time to consider my opinions!</p> <p>I've spent the past 13 seasons working in Little Cottonwood Canyon. I've lived in the Canyon, and have also utilized public transportation throughout much of that period (specifically for two years when I didn't own a vehicle). Even then...10+ years ago, the traffic was bad and there would be a red snake on a lot of busy snow days. But it has significantly worsened over the past 5 years...to where now, there are almost daily backups, and on every storm day you are most certainly forced to either beat the road closures, or to not ski at all...in my opinion. I mean there's no way I'm going to spend 3 hours waiting in a car. I simply don't have the time, but most importantly, it's morally unjustifiable given the current conditions of our environment.</p> <p>I believe immediate action is needed, and needed on a few different fronts. Minimizing the delays due to road closures is absolutely imperative. Snow Sheds need to be installed as soon as possible, period. It will decrease the amount of road closures... and man, shit is going to get a lot worse with the road in the next decade. Action needs to be taken immediately...and this I believe to be an important first step.</p> <p>The only logical move in my opinion is the Gondola, the main issue here is cars on the road and parking at the resorts. However I think alternatives would have to be discussed for those individuals that live closer to the canyon...when the thought of driving past Big Cottonwood...to then hop on a bus and head right back to the mouth where you live...simply might be too much to consider for most folks. Would there still be regular bus stops along the way...or is it only at the hub?</p> <p>Also, I think it's important to understand that many more individuals would take public transportation currently, but the thought of getting stuck on a bus standing up, awkwardly holding your gear for 3 hours...is absolutely terrifying, and more so probable. Throughout my 13 seasons in the LCC, I have opted out on taking the bus many times just because the latest bus departs Alta at 5:35... or 5:55pm (which doesn't even allow most employees of the Ski Area and the Town of Alta to complete their shift). We need to find a way to take care of the daily commuters that are working in the canyon at the very least...if there were a few late evening bus options...it would definitely make a difference in the parking situation up Canyon.</p> <p>Another plan should be devised for those who beat road closures. Some mornings they don't open the gate to the Gold Miners café until after interlodge has begun. Therefore during a short window, everyone is crammed into the entry way. This issue will only get much worse in years to come, and it's going to come with many voices bashing Alta. It's most certainly not Gold Miners issue, however something needs to be done to accommodate those beating the road closure...car pooling, and limiting congestion on those early mornings (aka...1/3 mornings throughout the season J). Perhaps looking into the construction of a new lodge (located west of the Buckhorn where the snow is pushed from the parkinglot)...that would eventually turn into the Gondola hub station at Alta in future years...a big spacious building where you could gather before the lifts open, and also grab a bite to eat mid-day, or hop on some wifi while you wait to ride the Gondola down.</p> <p>The PPSL is a unique idea, however for it to be effective it will require a ton of buses, and it will require constant road service... as the road won't have the snow compaction of all the other vehicles on days where it's accumulating quickly. Also, I think the only way for an extra lane to be effective as a bus only lane...it would also have to be monitored via a gate...allowing it to open to all traffic and or close during busy times to bus only traffic.</p> <p>Perhaps a swing lane could be an option. An extra lane that allowed up-traffic only in the AM's, and down traffic only in the afternoons and evenings. However, when the road is greasy...I think it would be hard to be comfortable driving next to someone in another lane, therefore medians on all lanes might have to be used, or something of the sort.</p> <p>Ok, that's all I have. Thank you for taking the time to consider my opinions on the travel situation in Little Cottonwood. For me...it's something that has to be addressed quickly, because many days I choose not to ski just because I don't want to add to the mess. It's a turn off that will eventually push many locals out of this area and onto more quiet and simple pastures.</p> <p>Skiing should be simple, it shouldn't require 3-7 hours of driving each day!</p> <p>Thank you!</p>	Noah Wetzel	Website
5718	As an outdoor enthusiast who has been fortunate enough to recreate in LCC for 43 years, I would like to lend my support to the Enhanced Bus Service alternative with no additional roadside capacity. My activities including hiking, snow shoeing, rock/ice climbing and back country skiing, I have seen year round increases in the numbers of people and cars utilizing this beautiful canyon, not only at the ski areas in the winter, but also all 4 seasons and dispersed the entire distance of the canyon. Anyone driving up the canyon recently, particularly during the COVID 19 pandemic, has seen that a gondola could not feasibly address the current uses. Also it would be an expensive proposition, at a time when government, business and private individuals are all compelled to tighten our belts.	Karen Kelley	Website
5719	Adding a new lane would have a very significant environmental impact in the canyon, one that cannot be reversed, as well as adding a tax burden for all citizens. The advantage of simple Enhanced Bus Service is that it is a cost effective way to assess how any change can improve traffic flow and congestion. Combining it with a toll or user fee to drive one's own vehicle up the canyon may enhance positive results. Simple cost effective measures such as these should be tried first, and their impacts given a genuine trial, before more expensive, access limiting and irreversible alternatives entertained. Thank you for your consideration and hard work on this challenging problem.		
	I support the gondola idea above the others	Travis Isaacson	Website

5720	<p>Although I favor Alternative 1 because of transit time and minimal environmental impact on the canyon, we believe the gondola alternative should be considered as an alternative. However, UDOT's Alternative 3 — Gondola does not go far enough to make it something that should be implemented. We do know of a proposal by CW which would offer the following improvements that would make the Gondola a much better option:</p> <ol style="list-style-type: none"> 1. The demand for a Kiss and Ride and public access and parking will occur once people understand that they can not access UDOT Alternative 3 gondola as proposed. Even if UDOT's long term intentions are otherwise, eventually citizens will demand easier access to board the gondola in a more direct manner. We believe the political will to restrict this will eventually fail. 2. Moving the gondola out of the mouth of the canyon only makes sense since it will require 1500+ parking stalls. Locating parking at the quarry trail is not acceptable under any condition. Moving the gondola 1 mile or further west will keep traffic out of the narrow choke point at the mouth of the canyon. UDOT should find a more acceptable location for the Gondola that will take into account the long term use and benefit by the public. It must also be compatible with the neighborhood surrounding the area. 3. Gondola capacity is critical, I believe that UDOT should increase what is in their proposal to what is being suggested by the alternate proposal. The alternate proposal proposes more than doubling the capacity and will further reduce auto traffic up the canyon. <p>My comments should not be taken as suggesting that I am in favor of the CW proposal, in fact there are many things about their proposal that needs work. However on the points that I have listed incorporating these would go a long way to make UDOT Proposal #3 more acceptable for the long run.</p>	David Hart	Website
5721	the gondolas are the best option to preserve the integrity and environment in the canyon. LOVE it.	Adrian Jay	Website
5722	Enhanced bus service with road widening is the best solution given the added utility of bike lanes in the summer. Adding a gondola would be too large of a change to the character of the canyon.	Ryan Bender	Website
5723	The gondola solution to transportation issues in the Canyon would be idea when augmented by the La Caille Base Station concept. Please consider this addition to an already excellent plan with gondola transportation to preserve the canyon, improve the air quality, eliminate traffic congestion, and make the entire experience better for all. Thank you	Tess Miner-Farra	Website
5724	I would leave it as it is and not disturb the canyon any more than we already do. No changes please.	Harry Sullivan	Website
5725	I am a lover and avid user of little cottonwood canyon and consider it a second home. To me there is only one option to really consider and that is the increased bus use in the canyon. Both widening the road and building a gondola will destroy some of the beauty that the canyon has to offer and with it destroying some of the recreation as well. Little Cottonwood canyon is a world renowned rock climbing mecha because of Utah's and Salt Lake Cities ties to the outdoor industry and building a wider road would destroy some of the most iconic and classic climbing spots. I realize that the city wants to try and make more money getting more people up the canyon to ski in the winter but a canyon alone shouldn't just be about making money. You also have to think about off peak season. Another thing to consider is the environmental aspect of the project you are about to indulge on. If it is true that you want to make more money off the canyon in the next 50 years wouldn't it be smarter to be part of the solution of climate change and try to prevent it with every action we take. Using a bus system might seem like it would hurt more than a gondola but with all of the larger machinery building the gondola and widening the road would not only make a mess of the canyon but would reap repercussions in the long term if there was shorter ski seasons or no skiing at all because of no snow. I am not an expert in any field but it seems to me that for the good of the canyon and the people who use it maybe being able to drive the canyon and even being stuck in traffic in the canyon might give people more time to see the canyon and fall in love with the canyon just as I have.	Kyle Combe	
5726	I support the Gondola and La Caille base station. It's hard to see the future but quite easy to see the that widening the road for more cars is simply a bandaid to an already problem. Too many cars. This canyon was not meant for 7,000 cars a day which will only grow. It's easy to predict the system doesn't work now and making it bigger won't make it better. Shelly Filgo	Shelly Filgo	Website
5727	<p>I support Alternative 1: Enhanced bus service.</p> <p>Overall, I am dismayed and discouraged with these options. There is no consideration of general usage needs of both Big and Little Cottonwood Canyons, nor Millcreek Canyon. The focus on Little Cottonwood Canyon is relevant only for resort users during the winter season. Year-round dispersed canyon users will experience no advantages, and will remain dependent on personal automobiles. The gondola and bus with roadway widening create environmental disruption and blight, and potentially erosion/run-off concerns, with huge costs.</p> <p>Our canyons and wild areas are our most prized assets. Wilderness, wildlife, and watershed preservation and protection should be the goal and highest priority. To consider a transportation system and infrastructure to benefit the resorts only is unfair, unwise, and ignores a huge user group of the Central Wasatch.</p> <p>UDOT really needs to go back to the drawing board, and collaborate with other groups studying broad canyon issues, including transportation. However, given the options, the least disruptive alternative is Alternative 1.</p>	Nancy Hanson	Website
5728	<p>Hello team, Please find attached the Wasatch Mountain Club comment.</p> <p>Thank you, Dennis Goreham WMC Conservation Director</p>	Dennis Goreham	Email
5729	I think the road should not be widened. Climbing is constantly road side, and will be affected, and I the road is widened there is no way around it, it will affect 50+ climbs, maybe more. A gondola is a decent idea, but also affects roadside landmarks and boulders. Bus is the best route, if climbers are expected to use it, boulders will have large crash pads, and trad climbers will have large packs. The bus would need to accommodate these if they are expected to use this. If the roadside parking is limited this is a must	Samantha Johnson	Website
5730	The gondola idea would be a great option, no pollution and less traffic. Gondolas!!!!!!	Larsen Jay	Website
5731	Please consider the "Enhanced Bus with roadway widening" and the "Gondola with bus from mobility hub" options. Thanks!	Jay Tee	Website
5732	I would like to see environmental impacts of each but based on the summary proposed I would support the gondola option so as to refuse the car pollutants coming up the canyon.	Lindsay Browning	Website
5733	I reviewed the EIS and I have serious concerns. The proposals are focused on getting people to and from the resorts. This ignores the needs of many people. The cottonwood canyons have huge visitation and should be preserved. Expanding the road or building a gondola will have a hugely negative impact on the environment (the main reason most people go into the canyon) with minimal benefit. I think improved bus service throughout the valley and improved parking at transit hubs (not solely at the mouth) are essential. Widening the road or building a gondola do not significantly ease congestion while they cause irreparable environmental damage. Until I read the report I felt building a gondola was a great idea, but it is focused on resorts only and does not stop in any of the areas I wish to visit. It also does little to ease congestion at great cost. Resorts should charge for parking. The parking fees should go to improved bus service from the entire valley. This would encourage resort users to take the bus. Parking for the canyon should not be at the mouth as this adds to the congestion. It is essential that bus service become extremely easy to use, while private cars become more costly. Improving existing bus services without widening the road and encouraging and facilitating ridership is the simplest, fastest, least expensive, and best option for the environment and the Wasatch Front community.	Janna Harrell	Website
5734	Awesomely	Kevin Kerchner	Website
5735	It's unfair to inextricably and permanently change the natural dynamics of LCC for one outdoor recreation industry but not others. Obviously ski traffic has the largest impact on winter traffic, and as a result this upper-class sport should bear the brunt of any responsibility. With that said, I am a proponent of genuinely giving the bus option a try by experimenting with a dedicated bus lane. Enforce often and via UDOT camera, issue a \$1000 ticket to any driver who tries to violate it's purpose, and keep LCC natural for those seeking free wilderness enjoyment. If the lane fails, the gondola is still an option. Make Snowbird and Alta pay for it if we must go that route.	William Kurek	Website
5736	I am a resident of Salt Lake City and an Alta skier. I support the proposal for the gondola. Over the past 19 years, I have seen that the implementation of buses has not been fulfilled. Without expanding the road, there will not be enough buses to get people up to the mountain without longer wait times. An expansion of the road is costly and environmentally degrading. While the gondola is a large upfront cost, it is the best solution.	Anika Heilweil	Website
5737	A gondola for little cottonwood canyon would take so much away from the beauty that is the canyon. Destroying areas to backcountry ski and climb in reality a better bus system with a large hub for parking makes much more sense. Allowing people still access up the canyon and not taking away anything from it. Enhancing a lane could be an alternative or having a toll For cars to incentivize the riding of buses. It would really do a disservice to later generations of lcc lovers to never see the canyon without a gondola in it.	Clinton Hoffar	Website
5738	I fully support the Gondola option. As a friend and frequent visitor to LCC and Alta/Snowbird, this option makes the most sense with little impact and many rewards. Sincerely, Chris Thoms	Chris Thoms	Website
5739	Gondola with more buses. One option isn't going to be enough. Will need multiple steps to improve traffic.	Keely Vandenberg	Website
5740	As a climber/backcountry skier/climber any limited or managed option for my use of the canyons would not be feasible-We oftenplan our adventure weather/conditions and public transit would be very difficult	Jackii Mudge	Website
5741	Your focus shpuld ne on viable public transit for reort skiers during the resort ski season		
5742	I would like to see the gondola option. Less ongoing costs and less impact. Additionally limit cars to residents and staff only and increase bus service without snow sheds. Lots of European ski towns do not have vehicle traffic	Jeff Vandenberg	Website
5743	As a long time skier, hiker, and Cottonwood Heights resident I strongly oppose the gondola plan and significant widening of Wasatch. The gondola would destroy the canyon experience and is useful only a few days a year. Road widening destroys a community and ruins the lovely access to the canyons. Why not start with enhanced bus service? It's not sexy but it's reasonably cheap and doesn't destroy the environment?	Nila Jane Haertel	Website
5743	Who benefits from adding more pavement, vehicles and carbon to this natural environment? NO ONE! Be an responsible steward and set a worthy example for others who watch over our natural resources. Choose the gondola project and protect the canyon's pristine beauty for future generations. EVERYONE Benefits from that!	Bill Weidner	Website
5744	<p>Hi:</p> <p>Let's start with the gondola alternative in any of its variations. It's vast overkill, akin to swatting flies with a bazooka. Traffic up (and down) LCC is only an issue on the small number of days each year when considerable snow has fallen and/or is falling, resulting in canyon closures or traffic jams caused by inadequately equipped vehicles. Why solve a problem that occurs on a small number of days each year with an inflexible solution that we taxpayers and area homeowners must endure year-round? And even the way that the UDOT has conceived the gondola alternative as presented here makes no sense. Those of us living in the mouth of LCC would be forced to drive in the opposite direction from the ski resorts to then take the gondola back in the direction from which we started? The gondola alternative is the worst of the three presented here (and the worst of other potential solutions not presented here), but at the very least, consider some additional gondola parking and loading across from (or at) the Quarry trailhead. (Not that it matters, but I believe this is Alta's take on this alternative as well). No need for the gondola to go any farther west than the Quarry trailhead and to magnify the negative aspects of this, the worst, solution.</p> <p>So by process of elimination, that leaves us with the two non-gondola alternatives presented here. I'm partial to alternative two, solely because bicyclists and pedestrians/joggers will get some benefit from the third lane in the vast majority of the days of any year in which snow traffic isn't an issue.</p> <p>But while I have this opportunity, both of the non-gondola alternatives could be vastly improved by, or maybe even made unnecessary by, levying tolls. The amount of the toll could be fine-tuned daily, or even hourly, to account for road conditions, seasonality, expected demand, vehicle origination (e.g. out-of-state or rental), etc. An app could alert potential canyon drivers of the cost in advance, and desired behavior (carpooling, public transport, alternative recreation or timing of that recreation) would thus be reinforced. UDOT or whoever should also consider enforcing that vehicles heading up the canyon during snow season must be certified as "storm-capable", including type of tire, adequate tread and of course 4WD or AWD. We drivers already must certify our vehicles as roadworthy and low-emission every year or so, too this would simply add another certification for those wishing to use the canyons that could be accomplished at the same time. And a toll booth scanner could check for this certification sticker in the process without using patrolmen at the canyon mouth to do it (which also slows down traffic). Putting signs in the parking lots at Snowbird and Alta to indicate driving time to the mouth of the canyon would also be a low-cost way to keep people from idling unnecessarily when there are unseen traffic issues at the end of the ski day. And I'll add a vote for avalanche sheds as well in combination with these solutions as a further way to keep snow off the roads and reduce transit times. They seem to work just fine in the Alps and Canada, where environmental concern runs more deeply than in the U.S. on the whole.</p>	Paul Winter	Website
5745	I am a resident of BCC and use both LCC and BCC to recreate in all seasons of the year. I believe it is important to preserve the canyons for current and future generations. I am against the gondola and lane widening options because I do not think they ultimately solve the problem and they impact the beauty of LCC. We only have one LCC. I think at this time, enhanced bus service is the best option. The ski resorts do have a maximum capacity unless people want to deal with constant traffic and lines, like ski resorts in Colorado. For the coming years, enhanced bus service is the best option.	Katie Erickson	Website
5746	Thank you for your work and consideration! Please do NOT build a gondola!	Caitrin Smith	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5747	There is plenty of unused parking in the Cottonwood Corporate Centet where Buckner, Galileo etc are tenants. Why can't we make arrangements with these building owners to use their parking stalls on the weekends for ski traffic vehicles. We could probably negotiate for weekday use as well given the current COVID situation and thg he fact that business models will be changing in the future with more people working from home. I DO NOT FAVOR A GONDOLA!! I'm in favor of the present traffic lanes and the addition of a bus lane that goes up the canyon in the morning and down canyon in the afternoon.	Andrea Orton	Website
5748	I support the Gondola! Traffic has gotten to be too congested.	Kajsa Marchetti	Website
5749	I fully support bus with roadway widening. I do not support the gondola.	Brett Karaus	Website
5750	We Highly favor the increased use of busses with mobility hubs at least at the gravel pit and 9400 South if not more locations. Residents have a right to be able to access their homes to take children to and from school and go to work themselves, so traffic control along with preservation of canyon are of utmost importance. No additional lanes for 210 or 209 or continuing up the canyon should be considered. If cars are restricted and/or tolled and only busses allowed during peak times, traffic should be manageable for all. And summer access should be treated in a similar manner. Under no circumstances does a gondola make any sense as it would only increase the traffic situation on Hwy210 which is already at an unacceptable point. We appreciate the work and time done for the alternatives and are grateful to be able to voice our concerns and suggestions. Thank you, Craig and Roberta Wardle	Craig and Roberta Wardle	Website
5751	No, no and heck no to changes to Little or Big Cottonwood Canyons. Improved bus service is all that is needed. I'm tired of the greedy new owners of Alta trying to squeeze the locals to line their pockets. First charging to go up Albion Basin Road under the guise of protecting the environment, when there has ALWAYS been the ability to limit cars & numbers. Yet they advertise "Wildflower Festival" in an effort to bring even more people up and make a buck. Then they put up that disgusting huge lift right up through the Albion Basin Campground along with the new hotel. Enough is enough!	Janice Noyce	Website
5752	To UDOT: I am a member of the Holladay City Council. My concern is that the Mobility Hub on SR-190, which is the only Mobility Hub to be constructed, would accommodate only 1,500 to 2,500 cars, whereas each of the three alternatives envisions moving more than 3,000 people per hour up Little Cottonwood Canyon. This would seem to induce thousands of drivers to find other parking areas near the Mobility Hub, including on North Wasatch Blvd and the residential neighborhoods in Holladay's Canyon Cove area, which is in close proximity to the proposed Mobility Hub. Thus, this improvement of access to Snowbird and Alta would have a disproportionate infrastructure impact upon Holladay City and the residents of Canyon Cove. Thank you, Dan Gibbons HOLLADAY CITY, COUNCIL	Dan Gibbons	Email
5753	Gondolas will be a great idea. This will cut down on traffic and pollution. Yes on gondola!	Stephen Jesse	Website
5754	The proposed alternatives fail to protect water quality, the flora and fauna, and the wildness of the Wasatch and focus almost exclusively on expensive and elaborate plans that serve the needs of wintertime ski resort users on a limited number of days. The gondola proposal is unduly expensive, is too slow, fails to address the needs of non-resort users. The alternative is also impractical as there is no reasonable proposal to provide parking, transit or otherwise get users to the bottom of the lift. The avalanche sheds, berms and road widening proposals have unacceptable environmental impacts without real benefit. On average, the LCC road is closed 10 days, while the best case plan only avoids closure on 4 days. Further, this benefit -- meager as it is -- only serves resort skiers, thereby further reducing its value. The mobility hubs also fail to resolve congestion and the analysis neglects to consider the cumulative impact of traffic and travel up Big Cottonwood Canyon. Widening Wasatch Blvd runs contrary to the public welfare and the public demand. People want walkable, bikeable streets, not semi-highways full of speeding cars. Wasatch is a popular destination for pedestrians. The proposal to widen this street would harm these users, homeowners and others all in the name again of providing questionable benefits to resort skiers to address harms that occur fairly rarely. In addition, more analysis must be dedicated to the interests of non-resort skiers and other users of the canyon not headed for the resorts. It is highly appropriate to consider running many more buses up LCC, but without the attendant proposal to widen the road. Parking lots associated with bus stops away from the mouths of the canyons must be established and improved and buses should run more often. Express buses headed only for Alta should be considered, along with buses that take skiers down canyon originating at Alta. Such an approach should be thoroughly considered as a less expensive, more beneficial and less environmentally damaging alternative.	Joro Walker	Website
5755	Please do NOT widen the road and accommodate more cars. I object to the building of a gondola to cut through the beauty of the wilderness. Instead of looking for mountain goats along the rocks, it will be gondola spotting. This sounds terrible. Encourage people to take the bus, add more busses, not more lanes.	Kirstin Forman	Website
5756	I support the gondola (with La Caille base station). In this model, I would also recommend Snowbird and Alta work with UDOT to ensure the pass includes free parking at the gondola base station. Likewise apply some pressure on Ikon issuers to get free parking at the gondola base station.	MATTHEW MOORE	Website
5757	Please, no gondola! It would totally junk up the canyon. I feel that more buses are the best bet, and restricting other vehicle travel during busy times. Road widening would also be fairly devastating. The canyon is so beautiful but has had such a brutal history with humans destroying the place, I'd hate to see it go further downhill.	Aden Parker	Website
5758	A native Utahn now living in another state. It's depressing to see how bad Salt Lake's urban planning is. The solution isn't wider roads. Public transportation and a gondola would add to the mystic of this canyon. Paving a freeway through the canyon would be a terrible idea. Tolls, trains, anything but a 4-5 lane road the whole way up. Wider roads would only increase the speed at which the box canyon reaches capacity... I really don't understand the logic.	Kameron Harper	Website
5759	The Gondola makes the most sense.	Mark Heinz	Website
5760	Prefer the Gondola option. I'm a full time Utah resident.	Susan Daniero	Website
5761	Gondola: safer, reduces all traffic and can be used off season as a way to generate revenue from tourists, hikers and mountain bikers I don't love the toll for vehicles. BUT if you do it you should have single use toll, multi use toll pass and season pass. As a ski instructor I would hate to see your ski instructors And other resort workers have to pay a single day toll each time they go to work.	Peter Shumsky	Website
5762	The MOST beautiful part of Wasatch Blvd and what you should replicate; South on Wasatch Blvd past 9800, Wasatch Blvd turns into the most exquisite road, shared by walkers, bikers, children, mom's with baby's, the cars are commuting to opposite sides of the city in a calm 35 mile an hour zone and its wonderful. The area looks amazing, the property values raise, there is no crazed passing and road rage, no noise pollution, the wonderful Wasatch Blvd that ALL Wasatch Blvd, including the 6200 south/ Wasatch Blvd corridor. There is even a large center lane that can be used for busses on heavy ski days which a few. This is the way ALL Wasatch Blvd should be.	Audrey Pines	Website
5763	I support Enhanced Bus Service - Option1 of the three alternatives. I believe this option with have the smallest environmental impact.	William Newmark	Email
5764	Bipolar speed limit. The speed limit changes so much on Wasatch Blvd it is so confusing, it encourages speeding and road rage beacuse people that drive on it thinks the entire thing is 50 miles per hour and of course that means they go 80. Wasatch Blvd has become quite dangerous. Just the fact you drop down to 35 in some areas shows you know that's the speed it should be	Audrey Pines	Website
5765	Thinks about the big picture; If you drive south on Wasatch Blvd past 9800 south the speed limit drops down to 35 miles er hour and it's wonderful. As the road winds around it is raised to 40 miles per hour for about 1 mile the drops back down, then raises up to 40 MPH for about a mile when you go left on 1700 East then back down to 35 all the way to the freeway. Why you go up and down causes confusion, you raise the speed limit up in residential areas, where people are coming in and out of roads, houses are on the street and people are using the street for recreation and exercise. Drop ALL of Wasatch Blvd to 35 MPH	Audrey Pines	Website
5766	Absolutely NO to more lanes on Wasatch Blvd. It is already a night and extremely dangerous to cross, adding more lanes in ludicrous. Not mention the environmental impact. You state on the main page of this site part of your goal is to keep in tact the integrity of the Wasatch Range. A gondola would be great. Widening Wasatch would be TERRIBLE. For everybody. Especially because it would not even solve your problem! Unless you also widen canyon roads, who's you can't, you will still have massive bottlenecks (even with a gondola because, yes, people will still be driving up also.). You will RUIN one of the most beautiful areas Utah has to offer. Widening Wasatch any amount, but especially but that many lanes (sevent! Insane!) will destroy the area environmentally, socially, and safety-wise. Getting out of my neighborhood (south of Big Cottonwood, East of Wasatch) is already near impossible and a complete FIRE AND CAR SAFETY HAZARD. If you continue with the proposed additional lanes along Wasatch, we will essentially be locked into our neighborhood. We have already contacted our lawyers to see what legal remedies we have should this proposal be approved. Expect law suits. We are absolutely opposed to the additional lanes on Wasatch and will fight them every way and at every turn. Please do not do this and ruin the community in such a way.	Brooke Bagley	Website
5767	Additionally, this is Terni Deihl's neighborhood. It seems he and UDOT still cannot untangle themselves, can they. Do more investigations need to happen? The development proposal expanding the Wasatch lane count is wrong for this area on so many levels.	Brooke Bagley	Website
5768	I strongly support option 1 for transportation up LLC. I believe it provides a long term solution with minimal impact on the canyon. I strongly disagree with alternative 2 as the widening of the road is not a good solution for many reasons. I also don't believe Alternative 3 will work in its currently planned deployment. If a gondola project is to occur I would recommend the CW Management Alternative referred to as La Caille Gondola. We live in the canyon and know the importance of snow sheds so if a gondola is every used we absolutely still need snow sheds. I also completely agree with charging a fee or toll for prime times to travel up the canyon by car.	Tamara Lazarev	Website
5769	I strongly support option 1 for transportation up LLC. I believe it provides a long term solution with minimal impact on the canyon. I strongly disagree with alternative 2 as the widening of the road is not a good solution for many reasons. I also don't believe Alternative 3 will work in its currently planned deployment. If a gondola project is to occur I would recommend the CW Management Alternative referred to as La Caille Gondola. We live in the canyon and know the importance of snow sheds so if a gondola is every used we absolutely still need snow sheds. I also completely agree with charging a fee or toll for prime times to travel up the canyon by car.	Ivan Lazarev	Website
5770	I, along with all other SLC climbers, urge you to perform a more in depth analysis on the possible negative impacts this will have on a highly trafficked 4-season climbing destination. The EIS does not currently have enough detail to make an informed decision with outdoor recreational usage in mind.	Andrew Acuff	Website
5771	Dear UDOT Wasatch Blvd is on the east side of the valley which is an older side of town and its got homes everywhere, and shops where people are trying to get in and out of the shops and shopping center. No where on the east side do you have a road that is 50 miles per hour that goes through neighborhoods and shopping areas. I'm not sure how you guys have gotten away with raising the speed limit to 50. Its quite dangerous. It makes no sense for the area between 6200 south and 4500 south. There is a freeway a mile away, if people are in a hurry they can get on the freeway. The old Wasatch Blvd is a road for sight seeing, biking, running, walking, there are hiking trails people are coming out of neighborhoods people are coming out from, people trying to pull over and enjoy the view, there are even houses on the street. But still you have the speed limit going up and down between 40 & 50 mph.. why? The entire Wasatch Blvd should be 35 MPH	Audrey Pines	Website
5772	My vote is for increased bus service with no additional road expansion. I live in the canyon and experience the canyon traffic in my own front yard. It can be frustrating and inconvenient, but it only affects us about 10 days a year. I don't believe a 10-15 day inconvenience should require a \$400 million dollar solution or road expansion that will damage the canyons natural beauty, poison our water shed and add noise and pollution to the canyon. Let's put money into making bus transit more convenient and desirable. Also... why was UDOT put in charge of the EIS? It makes no sense! This is a transit issue and UTA should have headed up this study.	Trina Sheranian	Website
5773	Call me what you will, but I feel like we deserve a gondola.	Nick Coletti	Website
5774	Please, don't destroy what we all live. NO Widening! No Gondola!	Jon Poulson	Website
5775	There really is no traffic problem except for a few days year, the commuter traffic is nothing, its not worth destroying such a beautiful area. We cannot get our beautiful area back if you destroy it. Cottonwood Heights has regulations against getting rid of the winds in the road and trees. Utah loves the road as it is., at the most add a center divider lane that can be used for busses & express busses in the AM, PM for commuters and for skiers. People would use the busses year round, allowing them to get off at hiking trails, the resorts. Especially if they leave early then have busses available for late return so you can stay for dinner. Just need some busses and a center busses only lane	Audrey Pines	Website

5776	<p>Hello,</p> <p>Thank you for your work in honoring public opinion and wishes regarding proposed improvements in LCC.</p> <p>I herein express my preference that Alternative 1, Improved Bus Service, be the route chosen by UDOT.</p> <p>Let's keep things simple. It also seem inappropriate for public interests to be merged with those of the for profit ski resorts (if that may be the case either expressed or implied).</p> <p>Thank you, Parker Williams</p>	Parker Williams	Email
5777	Our canyon is so magnificent! People LOVE to drive up into the canyon year round and enjoy the view, it's available for all ages. People love going for walks or hikes, looking up and out amazing mountains, the clouds, the trees, enjoying the birds, water, squirrel. A gondola would destroy this for ever more! This can never be undone or reversed, ever! A Bus is only there when needed, the huge towers of the gondola are there 24/7 350 days a year	Audrey Pines	Website
5778	Why is it even a discussion to tear down even more nature just so these ski resorts can make more money? It is absolutely abhorrent.	David Burford	Website
5779	No gondola and no road widening, without a doubt.	Jason Combes	Website
5780	Gondolas option would be best.	Matthew Tomczyk	Website
5781	The gondola is a no-brainer. The least amount of environmental impact out of any proposed projects. This can be enjoyed by more people than just skiers year round.	Matthew Pickup	Website
5782	Enhanced bussing is the answer. Widening the road and putting in a gondola both damage the nature that everyone is traveling up the canyon to enjoy, and the damage caused can never be undone.	Des Barker	Website
5783	The status quo has to change. For the environment and summer and winter recreation access to LCC, I am in favor of the LaCaille Base Station gondola option.		
5783	A gondola does not make sense. It would mostly be a tourist attraction but for those of us who backcountry ski and hike throughout the canyon it would offer nothing. It would serve the resorts interest almost exclusively and therefore they should fund it if it does occur. Hopefully it won't, it would be a monstrosity in an otherwise beautiful natural corridor. We do need a better solution than what's existing. Look at what aspen and many European resort towns do- they run frequent buses which are quick because the traffic is way down and you skip parking. There could be a bus line for the resorts with fewer stops and one for hikers backcountry skiers with frequent stops. Ride shares at the base. It doesn't have to be that complicated- we can look around and see what works for other similar resort town. Thank you for your time. Kelsey	Kelsey Barrell	Website
5784	Please consider not expanding the road or building a gondola as it will interfere with other recreation in the canyon	Dylan Cray-Kaden	Website
5785	The 5 to 7 lane highway doesn't make any sense. It will just move people up to the mouth of the canyon faster only to get bottle necked there. The danger multi-lane crossing at high speeds to get out of neighborhoods is not worth the risk. You need to rethink and make a better plan.	Dixie Brown	Website
5786	I think that the Gondola option is the least impactful to the canyon in both physical and sound impacts, and therefore the best. Any option that involves a continuous capacity addition / widening should be avoided because this will ravage the canyon, massively increase the road noise, and open the doorway to additional urbanization of a wilderness area much as has happened with Provo Canyon.	Justin Anderson	Website
5787	I vote gondola. I vote for an alternative form of transportation for the canyon.	Liz Rocco	Website
5788	<p>1. The alternatives summary states that the Enhanced Bus with Roadway Widening alternative will have lower O&M costs (\$6.2 million) than the Enhanced Bus with No Additional Roadway Capacity alternative (\$9.0 million). First, how is it possible that the roadway widening alternative, which requires an additional lane to be built, maintained, and plowed, would cost less than the alternative where only two lanes require maintenance and plowing? Second, how did you arrive at the figures \$9.0 million and \$6.2 million? I can't find data in the appendices to support those figures. Third, please also provide more information on what a revenue-hour is and how it compares to a cost per mile, specifically in terms of when it is appropriate to use one measure over the other.</p> <p>2. I don't think the capacity figures for the enhanced bus alternatives were calculated correctly. There is a difference between the capacity in terms of numbers of seats available, which is what these figures seem to be (number of buses * number of seats on those buses), and the functional number of people actually traveling up- and down-canyon, which varies by traffic volume. This is an important distinction because with the No Additional Roadway Capacity alternative, the buses will still mix with personal vehicles, and there may not be prohibitions on the number of personal vehicles in the canyons, meaning that those buses can still get stuck in traffic. The only way to reach the estimated capacity of 3,257 people per hour in the No Additional Roadway Capacity alternative is for there to be no traffic, which directly contradicts the known traffic problems in the canyon.</p> <p>3. Where in the analysis is the discussion of how it is possible to perform avalanche mitigation while the gondola runs?</p>	Julie Davenport	Website
5789	<p>The DEIS analyzes how climate change may impact snow levels and the ability to ski overall while extrapolating how that may affect traffic patterns in the canyon. Overall, it predicts that even with reduced snow and a shorter ski season that there would still be robust demand for skiing and by extension the canyon road. The DEIS cites evidence that the ski season will be shortened in the beginning and end of ski seasons, but this wouldn't affect traffic demands significantly since from December to March there would still be sufficient snow and wouldn't change traffic patterns. Snowbird and Alta are also higher in altitude and therefore are said to be more resilient to changes in climate.</p> <p>The DEIS should review the best available science that has a less optimistic perspective on how much precipitation will fall as snow instead of rain. NOAA data indicate that the CONUS snow-to-rain ratio of precipitation has trended sharply towards rain instead of snow between 1949 and 2016. One of the hydrologists from the study admitted, that by 2100 we'll just have rainfall in ski areas. The upper elevations of the Uinta Mountains may have snow, but the Wasatch Range will be snow free. The DEIS is too optimistic that people will still flock to ski resorts when there is little to no snow to ski or snowboard. It is extremely likely that by 2100 there will be basically no opportunities to ski, but well before this date the opportunities to ski will be significantly reduced. For this reason, the gondola option is wholly misguided as an alternative.</p> <p>We shouldn't be looking at a huge investment of resources where there will likely only be rain at the end of the century in the central Wasatch. This is particularly true when the U.S. has done very little to control carbon emitting sources of energy and move towards renewable sources of energy. The DEIS does not analyze various scenarios of warming based on high end or mid- range projections for warming. Currently trends should be based on high end projections since global emissions have not slowed and have in fact increased. The costs associated with in particular a gondola make no sense in light of what has been projected in terms of reduced snowfall in the near-term future.</p> <p>In addition, there are unique factors in Utah and the central Wasatch that was not mentioned in the DEIS but must be analyzed based on best available science. Based on recent studies it has become clear that lower lake levels of the Great Salt Lake contribute to increased dust and relatedly decreased snowpack that could be significant. These impacts must be analyzed given the unique geography and its impact on snowpack in the central Wasatch. Based on a study from the University of Utah in 2017 a dust storm on April 13, 2017, caused the fall of half of all dust for the season. When the sunlight was absorbed by the dust it caused the snow to darken and led to earlier snow melting. The near-term projections are that the lake levels will likely decrease another 3 feet due to climate change and thereby exacerbating this problem. It is also possible that lake levels could drop below the 4183 ft causing the south arm and north arm of Great Salt Lake to be unconnected in terms of hydrology. The effects of these trends in addition to the normal impacts of climate change could be catastrophic to the snowpack levels in the Wasatch. These impacts must be fully realized in the EIS and be considered when UDOT is considering the investment of irreplaceable resources in the form of options such as a very expensive gondola.</p> <p>The DEIS should project what the contribution to climate change the alternatives would present in terms of the construction of the various alternatives proposed. For instance, how much energy would be required to construct a gondola? What type of construction equipment would be utilized and which type of carbon contributing equipment would be utilized, for how long, and would be its impact on global climate change? What are the irreplaceable and irreversible commitment of resources for these alternatives? This is both for purposes of climate change and also in terms of monetary resources particularly with the more expensive gondola alternative.</p> <p>Joel Ban Salt Lake City</p>	Joel Ban	Website
5790	Pro for the buses... but regardless of what happens will there be a need to have people backcountry skiing at 6am on a Tuesday to take a gondola or bus? Or is this peak hours? Gondola scares me thinking about one Wasatch and all of the Backcountry in the central wasatch just becoming side country from gondolas... The solution needs to keep the naturalness of the area as a priority. I'd say I'm in favor of buses personally and keeping in mind whatever solution should happen during peak times. When the canyon is empty tourists and climbers should be able to drive up. Or maybe make gondola access resort only ...	Adam Rosenberg	Website
5791	I vote for gondola!	B. M. Simmons	Website
5792	I am personally in favor of the enhanced bus with no additional roadway capacity for LCC. I think increased bus with snow sheds and mobility hubs will help to alleviate the main "rush hour" challenges that are created with the morning and evening commutes combined with heavy snowfall.	Christianna Johnson	Website
5793	Although I see the benefits of the gondola to people participating in winter sports I feel like it does a disservice to people participating in other recreational activities such as hiking, climbing, biking, running, etc. It will obstruct the views and take away from the natural beauty of the canyon. Please consider what's best for everyone not just what is going to bring in the most money.	Bode Cary	Website
5794	This is a fantastic way to save the air quality, improve the canyon and open a whole new world with out damaging the canyons in our back yard! We are also for asking UDOT to implement a toll tag system for both Little and Big Cottonwood Canyons,, which might encourage more carpooling.....it would be great if you add that as well. The Canyon pass is a great idea and also worked well for us this pass season.	Michelle Greer	Website
5795	I visited Alta for the first time last winter and it instantly became my favorite ski resort. I've been telling my friends about it and I'm really excited about visiting again soon, but I'm also aware of the environmental impact of having new and more visitors. Although the car traffic was bearable on off-peak days, I became acutely aware of the traffic on on-peak days due to the uncertainty of the bus schedule and inaccessibility of the bus itself, leading to visitors like me relying on shuttles or personal transportation.	Elliot Chan	Website
5796	Therefore, I strongly support the gondola option.		
5796	It would be most convenient if the gondola base station itself had parking spots, but in lieu of that I would gladly take a bus from a closer base station (e.g. from La Caille as Gondola Works has proposed) in order to take the gondola. I would feel much safer taking the gondola than driving up the hill after a night of heavy snowfall.		
5797	Best idea ever. This makes so much sense. Great way to get people up the canyon and eliminate traffic.	Leslie Davies	Website
5797	I have been driving up little cottonwood canyon for over 40 years. The idea of being able to be transported up the canyon in a gondola would be a god send for me and future generations. Please make it happen.	Ed Davies	Website
5798	I do not think that you took into consideration the many uses of the canyon beyond ski resort and popular trail usage. But there is indeed a wide variety of uses in the canyon. There are roadside boulders that climbers use and are invaluable and are not near a major trailhead. These will likely be impacted by road widening and possibly the gondola. Restricting roadside parking also restricts access to the bouldering and other climbing and hiking areas. There are also numerous skiers that ski the backcountry that need access to parking in the canyon, these skiers often start before dawn or in the evening and so would not always be able to use the bus or gondola during operating hours. early morning hikers in the summer do this as well. I also notice proposed parking option at the gate buttress reduces the number of spots and then eliminates roadside parking?? That area is often overflowing as is and 21 spaces is not enough to accommodate.	Amelia Wilson	Website
5799	<p>This plan needs to be more thought out for the many uses of the canyon beyond ski resorts.</p> <p>The following comment is both my personal opinion as well as the opinion of my constituents. I am one of two District 4 representatives to the Granite Community Council which district lies at the mouth of Little Cottonwood Canyon and is directly impacted by these actions. In the last week, I have spoken to almost a dozen of the residents in my district and the comments that follows are the result:</p> <ul style="list-style-type: none"> - Of the three proposed alternative proposed in the Jun 2020 EIS Summary, only options 1 and 2 are reasonable. Of the screening criteria: safety, reliability, and mobility, only alternatives 1 and 2 sufficiently maintain or improve safety, reliability, and mobility for the proposed costs. - It seems clear that the conditions (inputs) for alternative #3, the gondola, have been purposely adjusted so that the cost has the appearance of being on par with the others. This was accomplished, in part, by removing one of the transit hubs making the comparison apples and oranges. The gondola will not offer sufficient improvements in speed to justify the proposed costs especially with one of the transit hubs removed. - Only alternatives 1 and 2 offer the most long term flexibility and keep our options open to adjust as needed. Only the improvements from options 1 and 2 justify the costs. My personal preference is option 2 but my constituents are open to both. They are ALL against the gondola and think it is a waste and does not represent good government nor wise stewardship of public funds under the current proposed option. 	Drew Weaver	Website

5800	I support the Gondola option for decreasing the traffic in Little Cottonwood Canyon. Best for the environment.	Dee Gardner	Website
5801	Of all the options I would want to see the gondola built. My next best choice would be to create a bus lane without widening the road. Above all I think that implementing the formerly proposed toll at the base of LCC should be implemented regardless.	James Dillon	Website
5802	Gondola or a tram would be ideal. The concern with gondola would be winds and capacity while the traM might be better For both. Parking is another concern.	Ken Downing	Website
5803	One of the plans is to run more buses during peak times? It is unfathomable that you would even consider ANY alternative that would forever alter the nature of LCC, like a gondola or widening the road, without first just simply running more buses. Think about it. You run more buses when you need to and don't run them when you don't need to. How is this even a problem? People are upset because they have to wait on Saturday morning to get a run on Big Emma? Please. The top of LCC has already been overdeveloped. Give the rest of the community a break.	Ron McKay	Website
5804	Gondola's would be a great way to reduce the congestion in the canyon. However, there would need to be a parking deck at the base of LCC. There would also need to be an expanded day lodge at Alta with storage lockers for gear storage.	Amelia Bednarczyk	Website
5805	I agree that something needs to be done about Canyon Transportation. In fact, traffic is one of the main things that sent me to the backcountry. I am concerned that your plans don't address backcountry access. I get up early to ski before work and I wouldn't be able to do that if I have to take a 62 minute gondola ride. Please consider keeping the Canyon open for us backcountry folk.	Brock Holt	Website
5806	As a resident of Salt Lake County, I would like to see an enhanced bus system with no road widening.	Megan Cota	Website
5807	I live near the base of Little Cottonwood Canyon and use the Canyon for skiing at the resorts, backcountry skiing and rock and ice climbing. We need to consider all users of the canyon and not just the resorts. The best option of the 3 proposed to maintain access to these activities is enhanced Bus (no widening of Hwy 210 in LCC). I currently don't like the bus as I have to often stand the whole time in ski boots- if you provide more buses and everyone sits, it would be a much more pleasant experience.	Jennifer Deans	Website
5808	Maintaining open recreation and the beauty of the canyon and is essential for the current generation and generations to come. Bus systems will do this and provide solutions to the traffic. Adding another lane or a gondola is a poor solution as it will diminish the natural beauty of the area, while enhanced bus will lay a foundation for fixing the traffic problem in big cottonwood canyon as well. This is clearly the better option as maintaining outdoor access for climbers and skiers outside of the ski resorts is what makes Utah and the greater Salt Lake City region special. A gondola will, at least in part, RUIN this beautiful canyon. Adding an additional lane will negatively impact climbing access. Please please please enhance bus service!!!!	Samuel Bloom	Website
5809	Both the Gondola and the Roadway expansion would be very costly and ruin some of the natural beauty of the canyon. The option that should be implemented in the expanded bus service without the expanded canyon road. This is the least expensive option, benefitting taxpayers, and also the least damaging to the natural canyon. Since it will be primarily the ski resorts that are getting the monetary benefits of more customers due to these expansions, the least expensive option should be used.	Caleb Grow	Website
5810	See attached letter of support.	Brad Wilson	Email
5811	Widening the road or constructing a gondola would eliminate access to hundreds of climbing routes in a world famous climbing destination. Either of those options would create a plethora of negative environmental impacts and would leave the canyon damaged beyond repair. Increasing bus routes up the canyon is the best option by far and would allow everyone who enjoys the canyon (not just skiers) continue to do so. Please do not widen the road.	John Schwarz	Website
5812	I am opposed to the proposal as each scenario involves widening Wasatch Blvd. I would like to see people who want to ski using public transportation to limit the amount of cars and crowding that exists on Wasatch and the Little Cottonwood Canyon Road. I favor using more buses that run more frequently to accommodate skiers during the winter. A system that restricts single car drivers headed up the mountain to ski would also be beneficial. I strongly oppose building a gondola. It would be inefficient, expensive, and an eyesore on the mountainside.	Alyssa Grow	Website
5813	I strongly agree that better and more efficient canyon access is necessary, but a road is NOT the answer. There is major impact on environment. The Gondola is the best option.	Kenna Moyer	Website
5814	Please consider expanding bus services. Please do NOT install a gondola up the canyon. Thanks	Carly Alleman	Website
5815	A gondola only serves the well-being of the resorts. It would damage the character and ecological resources of the canyon.	Andrew Alleman	Website
5816	I was surprised to see that the Gondola option was less expensive than the Enhanced Bus with road expansion option until I realized that it doesn't contain the snow shed structures for decreasing avalanche impact that the other 2 options contain. This seems like comparing apples and oranges. If there are still cars on the road, why wouldn't you address the avalanche problem in all 3 scenarios or none? My vote is for enhanced bus service, an additional lane and the structures to deal with avalanches. Also, since all of these changes primarily benefit the resorts, how much money will the resorts contribute to whichever plan is adopted? If the economy continues to tank, the cost of this infrastructure project may drop. Eventually, the canyons will need the capacity to move more people up and down. This could be the ideal time to build this infrastructure.	Nancy HALDEN	Website
5817	I am opposed to the proposals to build a gondola and to widen the road up the canyon. The gondola is the worst proposal. It will be very expensive (probably more expensive than the current estimates); it will exist to serve wealthy skiers going to very wealthy ski resorts rather than to serve the average resident of Utah; and it will be seen from all areas in the canyon, destroying the views of the natural beauty that currently exist. I favor the proposal to create a system of more frequent busing and to restrict the number of cars going up the canyon during the winter. Strong incentives should be created, or restrictions imposed, to strongly encourage or force skiers to abandon their cars and take the bus to the ski resorts. However, I do not like the current proposal to turn Wasatch Boulevard into a five-lane road. I have lived in that general area for most of my life. To create a five-lane road there would alter the character of the entire area, creating much more traffic, pollution, etc., which would be detrimental to local residents (many of whom can't afford to take up skiing) and would only be beneficial to wealthy skiers.	Matthew Grow	Website
5818	Have you considered only increasing bussing and slowing the speed down in the canyon? This will allow for fewer accidents in the summer when people park on the side of the road, make the canyon more user friendly, and still allow an increased number of people to reach the top of the canyon in the winter	Zach Niemeyer	Website
5819	Have you consulted with residents of cottonwood heights? A study should be done to understand what, if any, changes would be appropriate for wasatch boulevard. How are other master plans being considered?	Zach Niemeyer	Website
5820	As a backcountry skier, and a regular user of little cottonwood canyon year round, 2-3 times/month, I strongly oppose the gondola option (Alternative 3). Since the gondola only stops at ski resorts, it only benefits ski resorts and their patrons. Thus, our tax dollars would be paying to increase ski traffic at Snowbird and Alta, which is not how I wish to spend my money. Furthermore, the gondola would be an eyesore in the canyon year round, while at the same time serving very little purpose for the majority of the year. If ski resorts want to increase resort traffic they should pay for it themselves. I prefer Alternative 1, the option that enhances the current bus service without widening the roads. I value the natural beauty of the canyon, and I also am an avid rock climber enjoying the bouldering and routes that are adjacent to the road. Widening the roads would have the potential to permanently remove some of the world class rock climbing available in this canyon. Alternative 1 also includes snow sheds, which will improve the safety of winter canyon travel. This feature will benefit all winter users rather than focusing on ski resort patrons like Alternative 3. One final concern regarding Alternatives 3 and 2 is their potential environmental impact on the canyon. Choosing the most conservative environmental option at this time makes sense. We can always consider other more impactful plans in the future if this more conservative approach is not effective. But the impacts of Alternatives 3 and 2 are permanent and irreversible. In summary, our taxpayer dollars should support Alternative 1, which benefits all winter canyon recreationists and has the least environmental impact. Angela Presson Sandy, UT	Angela Presson	Email
5821	I don't think that the Gondola is a good idea. I believe it is a bad investment that will only solve part of the problem with traffic. It is not worth the damage that will be done to Little Cottonwood Canyon and the watershed. People will still drive anyways unless Snowbird and Alta incentivized customers to ride the gondola by making day tickets or season passes cheaper. Snowbird and Alta need to start charging for parking anyways and also have a toll fee for an annual canyon pass to motivate people to carpool or ride the bus. We should invest in better bus transportation and parking lot space to carpool.	Tyler Mifflin	Website
5822	I am concerned about environmental damage to the canyon and maintaining trails that are available now - quarry trail. I am most interested in increasing bus options and frequency. I am not interested in widening the road or a gondola for to environmental reasons. I think I'm addition to adding buses, the number of cars allowed up the canton should be significantly limited.	Cindy Solomon	Website
5823	I support the gondola option with the La Caille base station	John Foster	Website
5824	More buses please. No gondola please. Less cars allowed in the canyon period please.	Arie Leeftang	Website
5825	I would like to support Gondola option for Little Cottonwood Canyon project	Bob Vance	Website
5826	I appreciate the chance to participate and provide comments on the Draft Alternatives and Development Screening Report. These are my comments: 1. The screening criteria did not consider several impacts when assessing possible alternatives. These include impacts resulting from (1) the irreversible loss of existing recreation sites (bouldering areas along S.R. 210 or pullouts used to access popular backcountry skiing areas), (2) visual impacts from the gondola infrastructure to views from several scenic areas, (3) loss and take of migratory birds and raptors from collision with aerial structures, and (4) loss or degradation of important riparian habitats. These riparian habitats are distinct from the larger floodplain and provide unique functions and services. 2. Any changes to existing trailheads or roadside parking will affect summer recreational access and needs to be addressed in the Draft EIS. Summer mobility issues may not be a concern of this project, but any the proposed alternatives impacts on summer recreation do need to be considered. 3. The trailhead parking alternatives have largely been developed based on the Cottonwood Canyons Parking Studies conducted in 2012. These studies are almost 10 years old and do not accurately reflect the greatly expanded current parking needs. If the proposed parking areas are developed, access to several important trailheads will be reduced during both the winter and summer. Additionally, any parking options should consider meeting not just current parking needs, but accommodating future needs as well. 4. The restriction on roadside parking seems to be driven by a key and singular user group- road cyclists. Restricting public access to public lands based on a single user group seems inappropriate. 5. As written, the trailhead improvements and discussion of roadside parking alternatives is unclear about which alternatives are being considered. The discussion focuses entirely on eliminating roadside parking, which leads the reader to assume that elimination of roadside parking along the entirety of S.R. 210 is a forgone conclusion. Please expand this section by discussing all of the parking options proposed in the document. 6. It is unclear which areas and trailheads the buses will serve. Please add a detailed map showing existing bus stops and any new bus stops added as part of the plan. 7. I think any of the proposed transit concepts should consider how likely the public will be to use the alternative. If the intent of this plan is to increase mobility on S.R. 210 through reducing passenger cars and encouraging public transit use, the alternative that has the greatest public support and ridership should be considered the preferred alternative. Thank you for reading and the consideration.	Peter Goodwin	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	<p>I support the alternative of enhanced bus service without highway widening. I favor the bus alternative for several reasons. The EIS presumes that the three proposed alternatives will all reach fruition in 2050. Of the three the enhanced bus alternative is the most flexible and quickest to implement since it requires no additional infrastructure. The lead time for adding to the bus fleet is a matter of perhaps a year or two. Though diesel buses continue to be the best alternative currently available the technology for viable all electric or hybrid buses might be around the corner – making the bus alternative significantly more environmentally friendly. Unlike the tram buses are scalable. The alternative can be implemented almost immediately and increased as ridership increases and as other infrastructure necessary for its success comes on line. Buses rely on a dispersed technological solution, by which I mean every bus is a discrete component in the system, if one bus, for whatever reason, goes off line the entire system isn't incapacitated unlike what would be the case with a gondola. Enhanced bus service also represents the lowest capital cost of the three alternatives. Although mysteriously, not included anywhere in the EIS, buses also have the potential for serving backcountry trailheads.</p> <p>I'm also very concerned about the potential environmental impacts of the road construction were a bus lane and more particularly the damage a gondola alignment would inflict. The primary users of Little Cottonwood Canyon are mostly recreation seekers. The three transportation solutions proposed clearly have a bias towards winter use and specifically serving the needs of Alta and Snowbird resorts. As a watershed Little Cottonwood Canyon is a resource that is important to a much larger population along the Wasatch Front. With growing population inevitably demand will increase for water and with climate change, the quantity of quality water, which is after all a finite resource, becomes more important.</p>		
5827	<p>Aside from all of my other misgivings about the gondola, in particular its potential risk to watershed is uppermost among my concerns. I question that the greater good would ever be served by an alternative that benefits the few, but puts at risk the best interests of the many. The proposed right-of-way for the gondola, puts it adjacent to the creek and the requirements attendant to maintaining lifts requires roads. The alternative that minimizes potential damage to the watershed would likely be more important to the many Utah citizens whose water comes from the Cottonwoods watersheds.</p> <p>Although I do have concerns about the extent of impact that construction of the avalanche sheds might cause I do think the benefits for public safety outweigh the localized damage the project will cause. The road will remain an important component of the transportation mix for years to come. The reasons to continue to improve avalanche safety in Little Cottonwood Canyon will continue to be valid for years to come. Of the various alternative designs for the sheds I support the one that includes the berms. The linear structures will be shorter, cheaper, and possibly more effective for their intended purpose.</p> <p>A flaw in the overall concept of the plan is that it is centered on the individual automobile. For anyone, local or visitor alike, to easily avail themselves of whichever conveyance is ultimately chosen requires getting to the base of the canyon. The easiest means is and will remain for the near future individual automobile. None of the three transit alternatives will do more than partially relieve the problem of too many individual automobiles in Little Cottonwood Canyon. The plan does not consider that in thirty years the personal automobile on which so much of this concept is founded will likely no longer be an option.</p>	David Carroll	Website
	<p>I am strongly against the transition of Wasatch Blvd to five lanes, but I do however support some of the alternatives. It seems like the problems faced with increased commuter traffic versus ski traffic are mutually exclusive and rarely overlap but they can have some common solutions.</p> <p>As a Cottonwood Heights resident, the noise from Wasatch is already plentiful with the existing lanes and would only increase with an additional lane. The proximity to the mountains causes the noise to echo. Wildlife fatalities are already high enough along this segment of road and adding more cars isn't an appropriate response.</p> <p>I would propose a blended approach.</p> <ol style="list-style-type: none"> 1) Eliminate the gondola idea. It's an expensive novelty and still requires use of the transit hubs and increased bus services. 2) For the portions of Wasatch that are 2 lanes today, add ONE switchable lane based on time of day. In the mornings there can be 2 northbound lanes, transitioned in the middle of the day, and 2 southbound in the afternoon. This alleviates the peak rush hour traffic jams on work days. On weekends, these lanes can be dedicated bus only lanes to the resorts. Since significant uphill travel on snow days also corresponds to people working from home due to the weather, there should be minimal overlap in this multiple use scenario. <p>I've seen switchable lanes work well in other cities to accommodate commuters and Utahns will surely learn to adapt. Most have never driven the switchable lanes already in the valley. This helps us avoid over constructing to alleviate a problem that only exists a few hours of each day and on weekend mornings in the snow season.</p>		
5828	<p>The resorts are already at capacity during the ski season so there isn't much room for additional growth. Adding extra lanes to get people there faster makes no sense if they'll be unused shortly after when capacity is reached.</p> <p>For commuters, the east bench is approaching capacity for new development and the remaining open space is further south in Draper where residents would be more likely to take other surface streets or the interstate to drive north. Adding fulltime new "traffic lanes is a permanent solution to a periodic problem which can be solved with a more nuanced approach instead of paving over everything.</p> <ol style="list-style-type: none"> 3) The transit hubs for bus riders is a great idea. Given 60% are coming from the north, looking into an additional hub near I-80/I-15 with express service up the canyons could also help greatly. However, I believe existing fares contribute to the desire to drive a private vehicle because \$9 for a single round trip (per person) for a family is significantly more expensive than taking the minivan and a couple gallons of gas. Prices have to be lower to incentivize people to get out of their cars. Along with this, the increased bus service is an absolute must. Consideration should be given to express buses from the transit hubs to each resort instead of multiple stops to reduce turnover time. I live a mile from BCC and it takes over an hour on a bus to get to Brighton and there's a good chance I'll have to stand. In my personal vehicle it's 20 minutes. The rider fare has to come down along with the transit times to make buses the preferred option. 4) Regardless of the outcomes, I definitely support any extra lanes in the canyon being used for cycling/pedestrian traffic as this would go a long way to increase rider safety and alleviate traffic bottlenecks during the warmer months. 5) The snow berms are an excellent idea 6) While I support removing roadside parking near the resorts, dispersed parking should still remain elsewhere in the canyons. This reduces congestion at otherwise popular locations and allows people to spread out their hiking/climbing/snowshoeing/backcountry skiing which helps reduce environmental impact. <p>Thank you for your consideration.</p>	Matt Picard	Website
5829	<p>I am in support of expanding bus service with no road widening. I think this is most cost effective, does not require further development of canyon roadways or construction within the canyon that will disturb usability. This is environmentally friendlier than roadway expansion, which supports use of cars. It alleviates the issue of parking up canyon if more users can take the bus. It also makes the roadway safer when fewer cars are on the road on snowy days and more people can use the bus. In order for the bus option to be feasible, I would support expanded parking at the mouth of the canyons. I would also support continued police monitoring of cars driving up canyon on inclement days, checking for proper tire quality. Also I would support a toll implemented on weekends to further discourage driving up the canyon and to subsidize the bus program.</p>	Janel Scholine	Website
5830	<p>In addition to the gondola there needs to be stricter enforcement of onl vehicles with chains/4 wheel drive entering LCC.</p>	Nick Snyder	Website
5831	<p>Why not implement a carpool only policy for the canyon effective immediately before spending millions of dollars to support the leisure activities of rich people and tourists. The cost of public transportation in the city is prohibitively expensive for low-income families and students yet there is not talk of doing anything to spend some of the \$200 million on transporting residents to and from work/hospitals/schools.</p>	Amie Rosenberg	Website
5832	<p>I dont think the gondola is a good idea, i dont think the wider road is a good idea. I think the best option is to add more recourses so the bus system.</p> <p>Thank you for giving my comment due consideration and prioritizing little cottonwood canyon as a critical social determinant of health. With a growing population, now is the time to prioritize innovative transportation solutions and protect conservation efforts in the canyons along the wasatch front.</p> <p>LCC is a geological gem, a thriving natural space, and a critical source for water. The canyon provides an open space that positively benefits the physical and mental health of all that enter its granite walls. The congestion, and the pollution it brings along with it, disproportionately affects lower socioeconomic citizens. This group of people are also less likely to visit the canyon. It's important to decrease pollution, developed water conservation efforts, and make transportation more equitable and accessible right now.</p>	Conley Perry	Website
5833	<p>Increasing bus route timing, adding a lane for shared use, adding parking at the mouth of the canyon, and constructing a gondola are all critical to the future of LCC. Decreasing, or completely eliminating personal vehicles in the canyon will decrease pollution, and in turn keep the air and water cleaner! Having a robust bus system and the addition of the gondola will bring more people to the canyon to reap the benefits of time outside. I think the construction of a gondola is a creative solution and a statement that the citizens value innovation and conservation.</p> <p>My few concerns are with equitable winter access and how transportation changes may disproportionately affect black and brown communities and low socioeconomic status communities. *Will UTA fees increase for all riders to cover more bus routes and gondola construction? *What safety measures will be in place for winter hazards? *How will the additional shared use lane be protected from vehicular traffic in the summer months? *How will the gondola provide equitable access to the canyon for all users? *How can the addition of parking blend in with the landscape and also provide community space during underutilized times? (Shared bikes, picnic tables, bicycle skills course)</p> <p>Thanks again, good luck!</p>	Mary Walter	Website
5834	<p>I support the enhanced bus service without widening the road. Gondola is a terrible idea</p>	Adrienne Winter	Website
5835	<p>I am a resident of Utah for almost 4 years now and I am using a Little Cottonwood Canyon very frequently for skiing, snowboarding, mountain biking, hiking and snowshoeing as well as a simple recreation when I just want to gaze over the mountains. What I'm expecting from this canyon in the future is a Gondola transportation solution instead of widening a road. Gondola is the only reasonable option for a dead end road. Road widening and tunnels might make sense only for a through road. Thank You!</p>	Dmytro Sviridov	Website
5836	<p>I think the idea of building a Gondola and the base at La Caille is great; it would allow access even when the weather makes the road difficult.</p>	William Linke	Website
5837	<p>Alt 1 and 2 move the same amount of people, but Alt 2 is a lot more expensive. What is the additional benefit for Alt 2 and its additional cost? How big of an eyesore will the gondola be?</p>	Alan Peterson	Website
5838	<p>I am a Alta/Snowbird season passholder, and I am writing to support the development of the gondola system plus the base station at La Caille. The fact that a gondola has been proposed without providing parking at the base is intellectually reprehensible. How do you expect people to use a multimillion gondola system if you make it difficult to access? The goal for any public transportation system should be that it is as easy to access and use as possible.</p>	Pieter Kucharski	Website
5839	<p>The proposed La Caille base saves the gondola system from irrelevance. Build a massive parking ramp at the base station of the gondola. I will use it, and I guarantee you many others will.</p>	Daniel Harris	Website
5840	<p>I am a climber and I support the enhanced bus service without road widening. I am concerned that road widening would require the loss of many roadside bouldering and climbing areas. there should be a tram from park city or from midway, not from bottom of lcc. of the 4 options i think gondola is the best but would look for increased uphill capacity</p>	jeremy wenokur	Website
5841	<p>I'm both a skier and a climber, and I've had the chance to enjoy Little Cottonwood during both seasons. While some canyons/resorts can benefit from a Long tram system, Little Cottonwood is not one of them. With climbing being roadside, there would be no way not to destroy a significant amount of trees and rock. Little Cottonwood is too narrow, it is not a valley like so many European resorts are.</p>	Andrei Dan	Website
5842	<p>I support the enhanced bus.</p>	timothy choi	Website
5843	<p>I do not support the idea of a gondola or road widening. We have a very precious natural resource that should be protected at all cost.</p>	timothy choi	Website
5844	<p>Gondola with la Caille parking/base station. I have lived in Salt Lake County all my life and am a Alta/Snowbird season pass holder. I also ski the backcountry throughout LCC and hike/bike/climb in the canyon outside of winter. Please consider running the gondola year round, adding more stops for other users, allow bikes on the gondola, and last, I prefer more gondola cars with smaller occupancy per car. Thank you.</p>	David Bennett	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5845	I do not favor the most expensive option two where the main benefit to the user is just providing the shortest drive time. I like the least-expensive gondola option, but we haven't heard if it will require a fare and what it would cost to ride it. We also haven't heard if there is EIS info available for this option.	Tim Komlos	Website
5846	My vote would go with option number 1, with 24 buses and not road widening.	Nathan Perry	Website
5847	My family and I love Little Cottonwood Canyon and the entire Wasatch and we appreciate your work and outreach. We love to hike and we enjoy biking, downhill skiing, and snowshoeing. We are concerned about "loving to death" Little Cottonwood Canyon and the unsustainable usage of the canyon. LCC is a treasure that we must preserve for my daughters and future generations. We are also concerned about ski resorts taking priority over other uses and environmental protection of the watershed and the wilderness areas. We strongly oppose the gondola option. The gondola option does very little to alleviate traffic, is a precursor to an interconnect throughout the Wasatch with the accompanying development, is an inefficient use of limited taxpayer funds, and would price out many families. Additionally, a canyon-long gondola would forever scar the landscape. We should not build expensive infrastructure to accommodate a handful of users on a handful of peak traffic days. We have visited Switzerland and Austria and we used their gondola and cable car system. That system has its place, many of which are car-free valleys and not wilderness areas—but that place is not the length of LCC. We strongly support expanded bus service with mobility centers outside of LCC. However, the current bus alternatives need to consider more LCC users beyond ski resorts. Bus service must be year around to accommodate summer users and must access trail heads. Bus service could include BRT from the valley, direct shuttles from Park City to Snowbird/Alta, and van pools. Bus service is nimble and can upsize for peak times without needing year-round investment in an expensive and scarring gondola. If we brand it right and make it sufficiently convenient, people will use it. National parks successfully have transitioned visitors from cars to buses (Zion, Rocky Mtn., etc.) and LCC is easier because of the potential connections in the valley. Expanded bus service must be accompanied with a toll for single-occupancy vehicles or parking fees to incentivize more efficient travel. I recognize that Utah's growing population and the increased visitation to LCC likely will mean more parking needs. That said, if the goal is to reduce car traffic up the canyon, then let's first invest in sufficient bus service. Thanks again for your work and consideration.	Rachel Diehl	Website
5848	I am in favor of installing a Gondola in LCC. The traffic congestion in the canyon causes environmental hazards, as well as a frustrating and sometimes dangerous experience for motorists. As demand continues to grow, a gondola would allow efficient travel up the canyon with a minimal environmental impact.	Alanna Urie	Website
5849	Personally I think the Gondola has the most appeal. But the summary PDF does not answer a lot of questions. Can it run during winter storm/blizzard conditions? Will it need to stop for avalanche control work? etc. My biggest problem with all options is how narrowed the 'solutions' are. A target of 1,000 people per hour for public transportation is not enough. If the goal is to cap usage to 3,500 people per hour (and I think that is not enough as Salt Lake grows and the climate changes) than the ratio should be closer to 3,000 people per hour on public transport and only 500 people per hour in private vehicles. Allowing private vehicles and relying heavily on private vehicles is not going to solve the traffic issues in the canyon.	Mike Campanelli	Website
5850	it is incomprehensible to me that a concrete tunnel would even be considered.	viken kirian	Website
5851	I vote for the high speed, high capacity gondola + toll for private vehicles option. This is very clearly the best option all around—fewer cars, less pollution, less traffic, no widening of road or heavy construction of tunnels, more parking at base, beautiful, enjoyable ride for tourists and locals year-round. Thanks!	Sean Bingham	Website
5852	As long as there are good options for parking the gondola sounds good to me.	Brad Snyder	Website
5853	Enhanced busses/shuttles but no road widening. Otherwise climbing in LCC will be lessened and will ruin some of the amazing crags by widening the road or using other ways of transportation.	lily chisolm	Website
5854	I support the gondola	Gretchen Faucett	Website
5855	I am an Alta resident. I have lived here for over twenty years. Gilles Duranton of the University of Pennsylvania and Matthew Turner of Brown University posit a "fundamental law of road congestion": unless road space is priced appropriately, new capacity reduces the cost of driving, thereby inducing more of it, leading, eventually, to renewed congestion. -The Economist, May 11, 2019 Enhanced Bus with Roadway Widening is the current alternative that UDOT should select. It is the only alternative offering a meaningful improvement in travel time. Within the Canyon, the road should be three lanes: one uphill, one downhill, and a third lane separated with hard barriers. May through October, the third lane should be a two-lane dedicated bike path. Bike lanes could become an attraction instead of a hazard, and with the evolution of e-bikes, could become a viable summer transportation option for more people. November through April, the third lane should be a reversible lane for transit and emergency vehicles only. This will require significant tech. Passing lanes and pullouts should be added and improved. Slow vehicles delaying five or more cars should be required to pull out. The improvements should anticipate the coming changes in networked and autonomous vehicle tech. One thing that will not change is the need for pavement – the vehicles of the future will run on asphalt. Another thing that will not change is the need for avalanche protection on Highway 210. We should use the limited available money for road improvements and avalanche protection – which will be needed no matter what forms transportation takes – not on increasing the current vehicle capacity. As vehicles become more autonomous, they still are not smart. They need guidance, especially in hazardous terrain and adverse weather. Smart-road systems should be built into the roadway to guide vehicles. The hazard we are faced with is that we simply respond to roadway demand and thereby create more demand, in an ever-increasing cycle. True transportation vision requires breaking that cycle. The biggest problem in the canyon is too many vehicles. One clear solution is fewer vehicles per person. The path toward that solution is carpooling and new transit tech. Transit tech will evolve in ways that we do not yet fully understand. Carpooling, however, is something we can understand now. We should make carpooling incentives such as tolls, preferred parking, carpooling networks and apps, and easy carpooling pickup and drop off locations. Carpooling improvements are light on infrastructure and will offer a great return on investment. A gondola would be slow and ugly. The ski resorts are great, we love them, and we can see that a gondola would serve the ski resorts; however, that is not UDOT's mission. The mission is to serve the citizens and travelers. Cliff Curry, Alta, Utah July 10, 2020	Cliff Curry	Website
5856	I don't believe your study is doing anything but serving the ski resorts. You haven't taken into consideration the millions of people that come to hike, mountain bike, picnic, relax, bird watch, etc. What happened to the CCTAP? The Gondola is a ridiculous idea, not solving any congestion problems and again serving only the ski resorts, while ruining the beauty of the canyon! We need a capable transit system, not more roads and sheds. I believe this "EIS" is a total failure to address the transportation demands of all the people visiting these beautiful canyons of our year round. We don't need a ski resort interconnect to Park City!	Cathy Mullaly	Website
5857	I support a transport gondola for Little Cottonwood Canyon. If enhanced bus service is used I would suggest an express service that starts at the Uof U, has a stop on Foothill, a stop at 3900 & Wasatch, 6200 & Wasatch. I would encourage UDOT to build a transit center with lockers, restrooms & additional parking at 3900South	Patricia Thaxton	Website
5858	Please see the attached.	Stuart Adams	Email
5859	Thank you,		
5859	I support option 1 for enhanced bus service without road widening. We don't need a super highway in this canyon to serve the impatience of a few skiers. What we need is more far more parking at the base of the canyons, so that you can more easily catch a bus to ride up and down. The negative impacts on the environment are as a direct result of overuse. We do not need to make it more accessible to more people. A wider road would mean more people, faster. Faster means higher speeds and more dangerous.	Robert Phillips	Website
5860	The Gondola sounds great, but you need build a massive parking structure at the base of the Gondola.	Stuart Goldner	Website
5861	I would like to see a better solution to get to mountains instead of sitting in traffic.	Anatolijus Larosas	Website
5862	I am all the way for the gondola. Buses won't help since none of the people will be using them.	Anatolijus Karosas	Website
5863	To Whom It May Concern, I live along this corridor and find the speed people are driving very alarming. With the current speed limit set at 50 most people are driving 55. It is difficult and dangerous to pull in and out of the Kings Hill area into 50 MPH traffic. I travel along Wasatch extension down to Lehi for work. That road is 45 and 35 past La Caille and beyond. On my evening return sometimes when I pull onto Wasatch Blvd headed north people pass me in that short area where it turns into two lanes at the bottom of Golden Hills because they don't want to travel the speed limit and I am appearing to slow for them. I am keenly aware of people and wildlife so along this corridor of Wasatch extension I am driving the speed limit, plus I have taken it as a time in my day where I can slow down and enjoy the view. Wasatch Blvd has become a highway to the mountains. It is often congested. You have people from out of town not realizing this is residential because there is a 5 mile span with hardly any lights. By having high speeds I think it brings this thought process onto the mountain road as well and people are driving too fast up it as well. Also on the descent people are picking up speed so with the lack of many lights at the bottom drivers are ready to hit Wasatch Blvd in the valley like it's a race track. With an out of town mentality there is generally no regard for residents or wildlife. I know that something needs to be done with this road. I cannot imagine living past the High T towards Wasatch extension and trying to get home on powder days or busy ski weekends. I highly suggest that whatever action is taken on this road that the speed limit be lowered to allow a more safe passage for everyone and reduce the highway speed mentality for all. More info here - if you are interested.... http://www.savenotpave.org/ Thank you for your time, I hope that whatever action is done with this road it is good for the community and the mountains and not for the almighty dollar. We have to start thinking about what is good for the long haul and get out of our current short term financial gain way of thought with total disregard for the future and our children. Thanks again - Nancy Browne	Nancy Browne	Website
5864	Buses are the best option! Please dont widen the road! It would negatively affect many of the resources that bring people to lcc in the first place.	George Patten	Website
5865	Please, No GONDOLA!! It will ruin the beauty of the canyon! The obvious s most cost effective choice is more busses!!	Kristin Anderson	Website
5866	I have been recreating in LCC for 30+ years during all seasons. For many years I skied at the resorts but now I prefer backcountry touring in the winter. The option I support is Enhanced Bus Service with snow sheds. If buses are more convenient and less expensive than driving then people will use them. Buses need to be dedicated to each ski resort and trailheads to avoid multiple stops. If buses are the only vehicles allowed during peak hours this would also get people to realize the bus is a viable solution. The gondola is expensive and not a viable solution. The volume the gondola can handle does not match the number of visitors. You did not address if any of the \$400 million for the gondola would also improve the road for those that are still driving up LCC. Will there be an additional fee for riders using the gondola? Will there be a toll for driving? Neither of those were mentioned. The gondola will also have a very negative effect on the viewshed in LCC.	Christian Johnson	Website
5867	I support the first alternative. Please select the least intrusive solution.	Millie Fletcher	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	<p>I would like to start off by saying that I am an avid trail runner/peak bagger and am usually in the cottonwood canyons "little cottonwood included" multiple times a week. I go there because of LCC's amazing alpine terrain that is 15 minutes from my house. I can't speak on behalf of everyone but the drive up the canyon from the mouth with the giant towering granite walls is one of the most beautiful canyon entrances in the country. To place a gondola in this area would be an absolute letdown to current residents and all future recreators of LCC.</p> <p>The central wasatch is an extremely small mountain range compared to most other western states in general land mass when compared to its user count. I can't speak for everyone, but the cottonwood ridge and alpine ridge are something extremely unique and special that Utahns are able to hold dear to themselves. From rock climbers at the base of the canyon to hikers, bikers, motorcyclist's, scenic vehicle driving and winter recreation, I think I "can" vouch for most, a giant gondola system maybe one of the largest ever built would forever destroy the wildness that still remains in the untouched part of the canyon that the ski resorts don't currently reside in. From the canyon bottom all the way to the top where us "peakbaggers" spend most of our time this giant gondola system would take away one of the most special places that we have left in the central wasatch. Yes the resident of the salt lake valley are well aware that growth will continue to happen and the state will adapt, but a gondola is a massive intrusion into the mountain environment and an eyesore for most users, this is something that cannot be undone once initiated.</p>		
5868	<p>I regularly bring family and friends into the cottonwoods and they all exclaim in awe how beautiful of a canyon it is, and they also agree that a gondola would ruin what makes the first 3/4 of LCC so majestic and wild.</p> <p>Also as can be seen in essentially every single mountainous region that has become "commercialized" the wild of the landscape no longer exists. I realize that we cannot take away the ski resorts and that they serve their purpose, but the wasatch mountains in general are extremely small and once any of the local salt lake valley canyons are completely commercialized the wildness is gone forever and it becomes one giant resort for nothing for than monetary gain. I ask that UDOT consider how precious these canyons are to its residents and how special an untouched landscape is in a valley that is growing at unprecedented levels and with ever increasing backcountry users.</p> <p>My vote goes towards the bus system even though I believe that an electric rail line makes the most sense for both current users and future users. Either way the bus option with road widening will not drastically change the current environmental atmosphere of the canyon, and although there will be more traffic and buses, they will be hidden amongst the bottom of the canyon and not create the gigantic miles long eyesore of the gondola to all users throughout the canyon.</p> <p>In conclusion I ask UDOT to consider some of my points as a regular user of this canyon. Change is a part of our ever changing world, but consider the future users of these canyons and how your decisions today will effect how they get to enjoy the central wasatch with their own children some day. Keep some of utah wild and un-commercialized for the good of our community and to keep part of what makes utah- utah. Thank you for allowing me to comment and I hope that a decision can be made that helps the congestion, but that does not have an eternal loss on something the locals hold dear. Thank you.</p>	Daniel Barta	Website
5869	I support Alternative 1 - Enhanced Bus Service as it promotes the use of public transportation with limited environmental impact. I support the goal of reducing the number of private vehicles in the canyons.	Tony Zimmer	Website
5870	I am the Director of the Salt Lake Valley Trails Society, Salt Lake County's Mountain Bike trails group. We represent 80,000 enthusiast MTBers in the Salt Lake Valley, many who are LCC winter users, like members of our board of directors. Our group enthusiastically supports the gondola option as having fewer impacts on the LCC trail network and environment of LCC. In particular, the bus plus lane widening could have a major impact on the LCC/Quarry trail, especially in the Lisa Falls area where the trail sits in a narrow corridor between the present road and Little Cottonwood Creek. Additionally, while not examined in the EIS (this is a huge flaw), summer operations, including mountain biking, are much better served by a gondola, whose off-peak operations and operating costs would almost certainly be lower, while providing a better equipment accommodation for mountain bikes. Summer visitation to LCC now exceeds winter visitation, a disparity likely grow with a warming climate and the further build out of trails for hikers and MTBers, as planned by Alta, Snowbird and the USFS. Additionally, a gondola would likely have significantly fewer environmental impacts year-round, especially in the form of air pollution and noise which is creeping up the Canyon. Thanks for your good work.	KEVIN DWYER	Website
5871	I do NOT support any of the alternatives as presented!!!! Remove UDOT from the planning process of feasibility. They want to build things with concrete and asphalt, its what they do so their solutions default to something they build. Get a real transit study going. I believe a transit study should look at the feasibility of expanded express bus service increases from current transport hubs where there is already parking available. It is the stupidest idea ever to spend this kind of money on building new transit hubs right at the mouth of the canyons when we actually need transit hubs to focus on the rest of the valley. I don't support the tax payer boondoggle gondola!!!	Keith MOTLEY	Website
5872	<p>After reading over your proposals, the most non invasive and cost effective one would be to increase bus service and put in snow sheds. The canyon is a fragile resource and should not be made into a freeway which would damage the natural beauty and ecosystem. It appears that the best solution is to somehow reduce the amount of cars on the road. Increasing the number of lanes up the canyon would not only destroy some of the natural beauty and resources of the canyon but increase the amount of cars that could be stuffed up the canyon on any given day.</p> <p>Snow sheds help to keep the canyon open thereby keeping traffic flowing. Busses could help reduce the amount of cars driving up the canyon. Those going up the canyon to ski should be encouraged and rewarded for taking public transportation thus actually reducing the number of cars and increasing the number of people on the slopes. A win for both UDOT, the ski resorts, and all of us who think that LLC is one of the most beautiful places on the planet and should not be ruined by commercialism and greed. I would encourage you to consider all of the population, not just the ski resorts and their demands.</p> <p>If there must be a change then increased busses with snow sheds is the only reasonable option.</p>	An Anderson	Website
5873	I would support the enhanced busing system - with no roadway widening as my preferred option. If possible to widen the roadway with little to no minimal impact to the wildlife and canyon natural spaces at large, I would support that. But I hesitate to create a larger impact to the canyon.	Claire Gorton	Website
5874	I would prefer the enhanced busing option with no roadway widening as my preferred. If we were able to widen the roadway (for a bus system or a train) with minimal impact to wildlife and the canyon, I would support that but the proposed solution with widening would affect the canyon at large too much. I do NOT support the gondola.	Claire Gorton	Website
5875	<p>Hello - I have been a resident of SLC for 22 years and Little Cottonwood has been one of my primary reasons for living here. I frequent the area in the summer for hiking and rock climbing, and the winter for both in-area and backcountry skiing. I am strongly opposed to the Gondola option because of the ill effects construction will have in the watershed and in from industrial equipment permanently installed in areas that visitors use for hiking and climbing. I believe the enhanced bus option is the best choice for cost, ease of implementation, and environmental impact.</p> <p>Thank you Tommy Chandler</p>	Thomas Chandler	Website
5876	The gondola would be unique and effective. It also best preserves the canyon.	Troy Walker	Website
5877	Love the idea of an environmentally friendly way to get up the mountain. It would help with lines and decrease our pollution to keep our air clean in SLC. I wonder if a high speed train from downtown that goes up cottonwood would ever be feasible. I'm not sure the technology needed for that to do it in an environmentally friendly way. As a SLC resident I would support an environmentally friendly option to getting to the cottonwoods which I would use in both winter and fall- this would allow us to continue to enjoy the natural beauty of our area as we see our population grow.	Lauren Gimbel	Website
5878	<p>UDOT officers confirmed on July 1 and July 2, 2019 that a 35 mph speed design would be the focus of the LCC EIS. Now, in 2020, the EIS no longer resembles promises by project manager John Thomas nor the top executive of UDOT, Carlos Braceros. See Cottonwood Heights' City Council testimony by John Thomas and Mayor Michael Peterson Public Record July 2, 2019. Adopting a 35 mph design speed right for SR 210 through Cottonwood Heights' residential section now is a viable alternative supported by UDOT policy documents.</p> <p>According to 06C-25 "Establishment of Speed Limits On State Highways" shared by UDOT, there is a clear path for this project team to create the environment that would reduce the posted speed limit after a major reconstruction such as what is being proposed by the EIS:</p> <p>"A temporary Traffic Engineering Order (TEO) may be generated for a speed limit that matches the design speed when an existing roadway undergoes a substantial change such as a major widening such that the design speed of the new roadway is different than the posted speed limit prior to construction..."</p> <p>For the TEO to be generated for a speed limit of 35 mph, UDOT would adopt a Design Speed that corresponds to a 35 mph speed roadway. Currently UDOT is employing a design speed of 50 mph for its design patterns (i.e. 12' lanes, 14' medians, 20-22' clear zones on either side of shoulders).</p> <p>UDOT is defaulting to the existing 50 mph operational speed of a non-conforming roadway and using "standard designs" such as 12 feet lanes and 14 feet median. Instead, UDOT can pay keen attention to adjacent land use, culture, other traffic (pedestrian, cycling, and cross street patterns of traffic) when determining what the safest design speed is for the roadway.</p> <p>If the Reversible Lane alternative was eliminated based on detractive aesthetics of overhead signage & signals, why would a web of pedestrian bridges over WSB be put in UDOT's preferred alternatives?</p> <p>If pedestrian use along the two-miles of urban roadway will result in such a dangerous environment that pedestrian bridges are needed, shouldn't AASHTO's 1.5.2 Design in the Lower Speed Environment apply best?</p> <p>AASHTO's Engineer's green book spells out: "There are many situations in urban areas in which attempting to produce or design for lower speeds is appropriate. A low-speed environment is appropriate for residential streets, locations near schools and parks, and in downtown areas where there is considerable pedestrian traffic. Given the historic equating of design speed with design quality, the notion of designing a high-quality, low-speed road is counter-intuitive to some highway engineers. Yet it is in many cases the appropriate solution to a sensitive neighborhood or other street design problem. The severity of pedestrian crashes, a significant concern in urban areas, is greatly increased as speeds increase. Context-sensitive solutions for the urban environment often involve creating a safe roadway environment in which the driver is encouraged by the roadway's features and the surrounding area to operate at low speeds."</p> <p>The chart UDOT offers from AASHTO's clear zone requirements confirms UDOT's bias towards a high speed environment by matching the clear zones described within the EIS to those in the chart for 50 mph design speed. A 50 mph design speed requires wider lanes of travel, straightening of the road to provide a longer sight line, pedestrian bridges, etc. These expensive elements, would be unnecessary if using a 35 mph targeted design speed.</p>	Ellen Birrell	Website
5879	I like the idea of more busses and having them all be electric. Also, have certain busses have direct routes to the canyon. If you get picked up downtown Salt Lake, the bus goes straight up canyon with one stop at Snowbird and one stop at Alta, that's it. There should be other direct stops from larger parking areas throughout the Salt Lake Valley. Also, toll the road. Have a booth down at the bottom and toll cars coming up 24 hours a day. This person can then check for snow tires and 4x4 cars as well. Residents and owners in the canyon should not have to pay and maybe employers pay for employee passes. I feel if we make the busses more direct, have more of them, toll the road, or allow carpoolers to drive up at a discounted rate, it would help the canyon tremendously. Also, building a tunnel from Alta to Brighton would help with congestion.	Becky Hall	Website
5880	I am concerned about safety of pedestrian use along Wasatch Blvd. I understand that a pedestrian path along the east side of the Blvd has been added for this use. However, there has been no mention of traffic calming measures and speed reduction to address these concerns. Unfortunately simply adding a sidewalk along the Blvd won't encourage or sustain pedestrian use. Is it hard to send kids to school, parks, etc. alongside a multi lane high speed highway. Because the residents of Cottonwood Heights are such an active community, foot traffic and cyclist traffic must be better addressed. If I could offer a recommendation, it would be to add a park strip and green space as a traffic calming measure to break up the mass amount of asphalt that would only encourage higher speeds. (Similar to what has been done south of 9400 along Wasatch Blvd.)	Molly Sparks	Website
5881	As with Wasatch Backcountry Alliance and Save Our Canyons, I'm for option 1 (enhanced buses without road widening) until we can come up with the truly long lasting fix. We need trains and tunnels like central Switzerland despite the upfront cost.	Adam Blanchard	Website

5882	<p>I am glad to see that there is action being taken on the traffic issue. I see there are pros and cons of each option, but I most strongly support the enhanced bus access with road widening (or, secondary support for the enhanced service without road widening). The reasons for this are:</p> <ol style="list-style-type: none"> 1) Even just doing enhanced bus service would be good, but I don't see how it incentivizes anyone to use the bus instead of driving. Having a bus that has a priority lane that might travel up the canyon faster than a passenger car would give people a strong incentive to choose transit rather than private cars. I see this same problem with the gondola, although perhaps because people would use it because it is novel. 2) I would worry that a gondola might disturb the wilderness experience for backcountry users in a way that having additional traffic or a slightly wider road (in the same location where there is already a road) would do. As a backcountry user in both summer and winter (backcountry skiing, rock climbing, trail running), I am concerned about not disturbing the access or experience currently experienced in the backcountry. 3) Also, a gondola could not address offering transit options to backcountry users, whereas enhanced bus service (either with or without an exclusive lane) could easily add transit options for backcountry users at some point in the future (perhaps a non-express bus that left every 20 of 30 min and stopped at major trailheads). <p>A few areas of concern that I hope are considered with any of these options:</p> <ol style="list-style-type: none"> 1) Parking for backcountry/dispersed recreation (both summer and winter) might be affected if the road is widened – as a backcountry user, it is important to me to still have options for parking in all seasons (or a viable option to get to trailheads on public transit that stops frequently and reliably enough at all hours of the day). 2) Loading of either a bus or a gondola is a bottleneck. For current busses, there is sometimes a 2+ hour wait to get on one – even if busses/gondolas leave every 5-10 min, this may still be an issue on heavy use days, and if there is a long line it will discourage people from using the transit options (why would they when it is equivalent time to sit in their own vehicle?). This waiting time to board a bus/gondola – especially at peak resort-access times in the morning and afternoon – would need to be factored into the transit time up the canyon. <p>Please do not build a gondola. That will change the Wasatch Mountains forever. There is no ability to get the mountains back once they are destroyed.</p>	Cate Dolan Mitchell	Website
5883	<p>I would much rather see limitations placed on the number of people who can recreate in a day, rather than seeing more of our environment damaged to accommodate selfish humans.</p> <p>At the very least though, consider more buses. It would be less impactful on the environment, certainly less impactful than building a gondola.</p>	Kim Stanger	Website
5884	<p>UDOT should increase the number of UTA buses going up Little Cottonwood Canyon. The road should NOT be widened due to it being more costly, will have negative environmental impacts, and is not an effective measure to solve heavy traffic issues in the canyon immediately. The UTA should also consider adding more bus stops in the city on direct routes to the canyon to encourage people to ride the bus from their homes opposed to driving to the park and ride lots, which are vastly incapable of handling all the vehicles that drive up the canyon daily. Finally, UDOT should consider having a vehicle canyon pass. This pass would work similar to the Sun Pass or E-Z Pass (being attached to the windshield and providing an electronic signal to get scanned). People who prefer to drive up the canyon would have to pay for this pass pre-winter season. The amount of passes sold are determined on the number of day-lot parking spaces available at Alta and Snowbird. Those who drive up the canyon without this pass would be fined, similar to how electronic tolls work (picture of license plate taken and bill sent to address listed on vehicle registration). Employees who work in the canyon and commute from the city should receive a vehicle pass from their respective employer, but also be required to car-pool.</p>	Jacob Guden	Website
5885	<p>Increased emphasis on buses would be the least expensive and least impactful alternative.</p> <p>Dear Little Cottonwood EIS and UDOT,</p>	John Janson	Website
5886	<p>As a local Utah resident and avid backcountry skier and climber, I find myself enjoying the natural wonders of Little Cottonwood Canyon 2-3 times per week. It is a canyon full of incredible terrain and beauty. While access to the canyon is one of the major perks of living in the Salt Lake Valley, it comes with its own flaws as well. Specifically, access during the wintertime can be limited due to extreme weather and increasing tourism. There have been 3 main alternatives proposed for addressing the traffic and congestion. I believe that of the three options, the best option is to focus on enhanced bus service. This statement comes from a few different reasons: (1), all three options require better parking infrastructure at the base of the canyons, (2), the gondola proposal ruins the natural beauty of the canyon, and (3), the gondola has no capacity to support other winter trailheads and destinations.</p> <p>For many years, the ski resorts have been urging skiers and canyon users to carpool or take the bus to minimize wintertime congestion; however, this is not a sustainable means of transportation with the current parking infrastructure. There have been many times where I have had intentions of driving to a park-and-ride to bus up the canyon, only to find out that there are no available parking spots at the base. For any of the alternative transportation solutions to be feasible, there needs to be some type of parking garage or other parking infrastructure for us to utilize. Without it, we will continue to have a major problem as the number of parking spots at the base of the canyon limits the amount of people who can utilize the busses.</p> <p>Even with the parking issue addressed, I still believe that the gondola is a terrible idea. Personally, I love recreating in the canyon multiple times a week. One of the biggest reasons I enjoy LCC is its beauty year-round. By installing a Gondola, the entire canyon becomes a ski resort. After summiting a major climb lower down in the canyon, the last thing I want to see is an ugly Gondola waiting to be used by wintertime tourists. The gondola will absolutely degrade the serenity of the canyon.</p> <p>Lastly, the gondola only caters to resort skiers specifically in LCC. In the 2019-2020 season, I spent 47/53 of my ski dates in the backcountry. Although I was not having to reach the very top of the canyon, I still had to endure the same traffic that the resort skiers sat through. The proposed gondola will only stop at Snowbird and Alta, but there are many other trailheads along LCC that are huge access points for skiers. Additionally, the gondola will not service any ski trailheads in big cottonwood canyon either, where the traffic is just as bad. With the bus route, it would not be difficult to add stops at major trailheads along both canyons. This would make the bus option viable for backcountry skiers and resort skiers alike.</p> <p>Overall, there needs to be a plan to reduce the congestion in LCC. While three options have been proposed, there are still many other options out there. For example, during peak ski season months, a shuttle-only system could be implemented which would restrict the number of personal vehicles going up the canyon. Additionally, many regular users of the canyon would be willing to pay a small fee to access the canyon. This fee could be used to help support better parking infrastructure at the base.</p> <p>While each proposed option has its own pros and cons, none of them will be viable without enhanced parking availability at the base of the canyons. Additionally, the gondola should not be built because it only caters to a specific audience, as well as destroys the natural beauty of the canyon.</p>	Landon Crowther	Website
5887	<p>Thank you for the thoughtful plan. I want to comment that the gondola seems like a very poor option. It will limit the amount of the canyon that can be serviced by public transportation, is extremely expensive, slow, only serves the resorts, and opens the possibility for more lifts and would change the character of the canyon. Thanks, Adam de Havenon</p>	Adam de Havenon	Website
5888	<p>I am supportive of the gondola to Snowbird/Alta from the mouth of the canyon.</p>	Jim Oberweis	Website
5889	<p>Our beautiful resources need to be preserved and prioritized. Instead of adding a monstrous gondola, parking lots that draw more cars into the mouth of Little Cottonwood Canyon, and talk of "more" ... we need to figure out how to preserve, limit, and appreciate. The ski resorts should limit the number of visitors (online reservations/tickets only... similar to how theme parks are working with COVID-19 this summer) and bus transportation needs to be streamlined ("express" buses/vans that pick up at locations around the valley and then go directly up Little Cottonwood).</p> <p>It disappoints me (any many others) that UDOT, city leaders, and other "people of influence" feel that the above stated ideas are good for our community.</p>	Annette Marchant	Website
5890	<p>Let us step back and use common sense. Would it be not possible to utilize a mandatory bus transit to the resorts. Each bus eliminates 50 vehicles. This could resolve not needing to widen roads. Parking lots would need to be provided for to accommodate vehicles. Exceptions would be required for commercial and other necessary vehicles. This should be considered a 4th option.</p>	Gary Hadfield	Website
5891	<p>Do not add an extra lane or change the footprint of transportation at all up the canyon, thus preserving the watershed and natural environment.</p>	Sarah Schwieger	Website
5892	<p>I am in FULL support of the Gondola plan for a multitude of reasons including environment, congestion and ease of access. Please go forth with this plan!</p>	Arthur Castillo	Website
5893	<p>This is a very interesting project. I work for The Boring Company, a transportation company that builds and operates low-cost, zero emissions, underground infrastructure. I believe The Boring Company's Loop transportation system could provide a useful project alternative which may be worth UDOT's consideration.</p> <p>Please feel free to visit www.boringcompany.com for more information or contact tunnels@boringcompany.com if you are interested in discussing further.</p>	Michael Thompson	Website
5894	<p>I support the Enhanced Bus Service without roadway widening, with snow sheds to reduce powder-day road closure congestion and private vehicle tolling (at least in upper canyon) to encourage bus ridership.</p> <p>I am a frequent user of LCC, as both a backcountry and resort skier in the winter, and a climber, hiker and mountain biker in the summer.</p> <p>I am trying to keep an open mind about the gondola, since I have been to europe and I do ski the resorts... but if you have to take a bus to get to the gondola, that stinks. You should just stay on the bus at that point! I see that the La Callie Base promoted by the ski resorts could include parking at the base of LCC, but it seems like there is limited real estate for the parking garage there? Also a big garage at the base of LCC would be unsightly, and it would still push a lot of single occupancy cars through the cottonwood heights neighborhoods. I also think having a gondola AND a road in the bottom of LCC would be a big (visual) impact to the natural character of the canyon. Bouldering while a gondola cruises overhead? Ski resorts are so ugly in the summer already. Hiking, biking and climbing recreation at the base of the canyon with the gondola running through everything is not appealing.</p> <p>To speed up travel time I see that peak-season winter busses would not stop at trailheads, but I could see them being flexible in the summer by providing trailhead access whereas the gondola would ONLY go to the resorts, ever. Granted BCC has a lot more trailheads than LCC (which mainly has White Pine and Lisa Falls) so it's not as big of a deal, but the gondola would just be an extension of the resort and would not be able to alleviate summer congestion and parking in the rest of the canyon.</p> <p>Another point: the bus (or gondola) needs to be free to ride to work, otherwise people will just want to drive. Not because of the cost, but because figuring out how to pay is a hassle. You already have gas in your car so that's easy, but how do you pay to ride the bus? Do you need to fish out your credit card from your ski clothes while everyone waits behind you to get on the bus? Do you need exact change (the worst)? It's stressful. The transit needs to be free and the road needs to be tolled to get people on the transit.</p> <p>I am generally opposed to having 2 Peak Period Shoulder lanes, since that is a significant widening of the road and would impact the canyon (and the bouldering!), but I could see adding a single, directional peak use bus shoulder lane, maybe, since there is already a wide shoulder in some places. This would just keep the buses moving in the busy direction at peak-peak times (Saturday powder morning). But not 2 lanes - making it a 4 lane road - that seems unnecessary. And I would hope that with the snow sheds the 8am avalanche control road closures would be reduced, which is a big source of the winter congestion that backs up on Wasatch Boulevard.</p> <p>Lastly, all of the plans appear to re-configured Wasatch Boulevard through Cottonwood Heights to handle traffic growth, and I'm concerned about neighborhood impact of faster, wider road there. How do resident pedestrians cross the road?</p>	Evan Johnson	Website
5895	<p>I support the Gondola Plus La Caille Base Station proposal</p>	landon meier	Website
5896	<p>The gondola option only makes sense with the revision that would have parking directly next to the base station. People are not likely to take a gondola that requires taking a shuttle bus from a parking lot.</p>	Juliana Ma	Website
5897	<p>We live just off of Wasatch. I can see the street from my window. The ski park and ride is across the street from me. PLEASE DO NOT widen the road. What for? So that people can sit in front of my house, with the fumes from their cars making it even harder for an asthmatic to breath. This will do nothing to ease the traffic situation. It's flawed. It will devalue the cost of our home, which we paid a fair amount for. It will pollute the air. People will still be angry and frustrated as they wait for Little Cottonwood while it's closed for avalanche control. We ask you to please not do it. It doesn't seem to accomplish a thing.</p>	jill reid	Website
5898	<p>As a long term (20+ years) employee of Snowbird I know all to well of the challenges that face this stretch of highway and how those issues will only compound in the future. This is why I feel that the solution to these problems will not be solved by the same answers that created them such as more busses and more asphalt. This is a very short sided way and one that would only kick the can down the road. This is why I feel that the best solution to the traffic congestion in the Cottonwood Canyons is to do something different. Ropeways have a long history of use throughout the world and in Utah. Using a 3s that system that would be capable of not only the distance but also the capacity needed is in my opinion the best solution and the most cost effective in the long term. With this I wholeheartedly support the proposal put forth as Gondolaworks.</p>	Cory Cowan	Website
5899	<p>I think the best option will be the gondola. Lets have less cars and less pollution from fossil fuel.</p>	Timothy Wolfgram	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5900	<p>UDOT Planners, I appreciate the opportunity to provide input regarding UDOT's Little Cottonwood Canyon Environmental Impact Statement Draft Alternatives Development and Screening Report. I have been a recreational user of Little Cottonwood Canyon's (LCC) climbing resources for over 20 years and have experienced the increase traffic first hand, and understand the need for action. With an ever increasing population in the greater Salt Lake City area, it is becoming more and more difficult to find outdoor experiences that are not highly congested, and therefore the outdoor areas in the greater Salt Lake City area must be protected.</p> <p>I support the Alternative of Enhanced Bus and NO additional roadside capacity and NO roadway widening. Also, if proposed, I would support a user fee to enter LCC similar to what is in place in Millcreek Canyon or American Fork Canyon. Imposing a user fee would help mitigate congestion and create funds to be used for improvements to LCC.</p> <p>Regards, Steven Walters</p>	Steven Walters	Website
5901	I support the gondola option. I feel this would be better for the environment by reducing the number of vehicles in the canyon, and add to the experience of traveling up one of the most beautiful canyons in the world.	Jon Hansen	Website
5902	As an avid user of this precious resource I urge that more research be done on the impacts further development might have on the canyon and it's use. People who recreate in the canyon want to keep complete access. Please consider only further enhancements to bus travel during peak seasons. Thank you!	Hyrum Maynez	Website
5903	<p>Building a 3500 car parking structure that sits empty 8 months of the year (at the tax payers expense) is wrong.</p> <p>It's wrong on Wasatch Blvd, it's wrong at 9400 south, it's wrong anywhere.</p> <p>Such a structure is a magnet for graffiti, vandalism and crime. Please think responsibly for the beauty and sensible use of our community land. I agree we need to move skiers up the mountain quickly. The access and quick mobility is part of the lure of skiing here in Utah and it is an essential part of our economy. But 8 months out of the year (when skiers are not here) this area that contains this structure must be an asset to it's location.</p>	Diane Wells	Website
5904	As a recreator of LCC in the boulders existing on the shoulders of the canyon, I do not want the widening of roads. Please consider ONLY ENHANCED BUS SERVICE. NO gondola.	Jules Cho	Website
5905	supports the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	Jason Rasmussen	Website
5906	Please put more resources into the bus system. I want to ride the bus up the canyon but it is inefficient and a hassle. Busses don't run frequently enough and the park n ride lots fill very quickly. I would like to see a more central hub parking lot/structure with busses constantly coming and going. There should be an incentive to ride the bus also because right now there is no downside to driving by yourself and clogging the canyon. People need to question if driving up alone is the right call, right now, it's a no brainer because of how awful the experience of the ski bus often is	Pierce Whalen	Website
5907	supports the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.	Whitney Rasmussen	Website
5908	Regardless of which option you go with, I'd like to see the base area built up into something nice. Ample parking and restrooms are an absolute requirement. Maybe some of the cost could be offset by renting retail space. Ideally, a coffee/breakfast spot, a convenience store, a ski shop, and some local bars/restaurants. It would be great to get down the mountain and be able to sit down Red Iguana East or a branch of Red Rock or the Pie. Also, if one of the bus options is chosen, completely eliminate cars on heavy/slow traffic days. A bus with chains should be able to get down the canyon in 45 minutes on even the worst roads you're likely to see if there's no other traffic on the road. It's bad roads plus congestion that create 3 hour commutes and you can't get rid of bad roads, so remove the congestion instead. Once the hub area is built, you could even bus from there for a year or two, then upgrade to a gondola later to spread out costs. A pleasant base area with the amenities to keep people waiting comfortable is the key to the whole thing.	Bennett Wohlfeld	Website
5909	I like the idea of the gondola, but a bus to the gondola seems like people will just avoid it. Is the new gondola option with parking by La Caille even an option at this point? Also- will there be enough parking at the new mobility hub? I am afraid that with the time constraint and possible parking being too little, the gondola will be avoided. I like the enhanced bus the roadway enhancements second - I wish we could do both. I do feel we need more trailhead parking. Gate buttress needs a bathroom but it looks like the plan is for less parking than exists. The Great White Icicle parking needs to be created (not sure if that is what bridge trailhead is). White Pine needs expanding (make it huge) and police- too many cars getting broken into on a regular basis- it is known for this now. Lisa Falls also needs real parking.	Garth Tino	Website
5910	Strongly oppose the gondola. Favor enhanced bus with roadway extension. Gondola would be an eyesore and way too expensive and would further disrupt the canyon.	David Mangum	Website
5911	Gondola is my choice!	Trisha Breiling	Website
5912	My priorities are clean air, habitat preservation and long term solutions. I also believe we are at the time where doing nothing creates irreparable damage - so making a choice to do something now matters. I believe that the only solution that addresses my priorities is Gondola. Gondola is also the only option that address life and safety issues for users and first responders. The LaCaille station option is the only choice that hooks to regional transportation planning efforts, respects the canyon's beauty, includes preservation for the next generation and solves traffic issues at the mouth. Additionally takes down the barriers to using mass transit (time, ease and comfort) - which is a huge win in Utah to get more of us on public transportation and out of our SUVs	Maura Carabello	Website
5913	See attached comment	Zinnia Wilson	Email
5914	<p>I strongly support the recently proposed La Caille Gondola option. It is the best alternative because of its high capacity, low environmental impact, dedicated parking and transit center, and its ability to run in any weather or avalanche conditions. It will also get more vehicles off the highway than the bus options, lowering the in-canyon environmental footprint. Additionally, it will offer a one of a kind attraction for Utah residents and tourists alike. I hope that UDOT will consider the La Caille base area gondola option instead of its previously proposed gondola option, which did not have an on-site parking structure.</p> <p>Sincerely, Jonathan Lee</p>	Jonathan Lee	Website
5915	The Train Alternative: The Granite Community Council met on Wednesday July 8th and voted to request that UDOT not consider any requests to reopen or reconsider the alternative of a train up Little Cottonwood Canyon. The Council opposes the train alternative because of the negative environmental impact, the high cost, and the large number of homes that would be affected by along the train route. Thank You	The Granite Community Council	Website
5916	A Gondola on the Backside of the Ski Resorts: The Granite Community Council met on Wednesday July 8th and voted to request that UDOT reconsider the alternative of a gondola which would be built on the backside of the ski resorts. The gondola would have a base station beginning somewhere near I-80 in the Park City / Kimball Junction area and pass through the ski resorts in Park City and Big Cottonwood Canyon and terminate in Little Cottonwood Canyon. The benefits would include a reduction in the traffic from Park City to Alta and Brighton. It would also reduce ski traffic coming from the Salt Lake City area up both Big and Little Cottonwood Canyons as skiers choose to drive the alternate route up I-80 created by the backside gondola instead of driving up the canyons. This alternative would also help address the emergency egress issues in both Big and Little Cottonwood Canyons. Thank You	The Granite Community Council	Website
5917	I dont believe that creating additional bus traffic in little cottonwood canyon is a great solution. The gondola would likely be more skier friendly while minimizing actual vehicle traffic. A canyon road widening would likely be unnecessary with this option however minimal environmental impact would be necessary. The natural beauty of the canyon is what makes it such a popular destination and maintaining a quality environment should be the first concern of the project. I do not want more bus traffic but am in favor of the gondola.	Joseph Vigil	Website
5918	Do not add more traffic lanes to Little Cottonwood Canyon road. Please look at the gondola option and all other options.	Stacey Thomas-Keller	Website
5919	I write in support I'd option 3 the gondola system As the original and lead architect and planner of Snowbird I proposed a tram (gondola) 50 years ago. I anticipated the problem we are now facing . A gondola will have far less impact on the environment physically and visually. Avalanche and snow sheds and widening the road require Massive cut and fill having huge impact on the canyon. A gondola will also greatly reduce if not eliminate the large parking lots which could be reforested thus improving air and water quality. A gondola system is safer as well in that it would eliminate driving by car or bus in snow and ice conditions. Clearly a gondola system will serve the greater good in all aspects. Sincerely and respectfully, Jack Smith, FAIA, Architect	Smith Jack	Website
5920	Please preserve the canyon, use buses rather than a tram. Any changes that will impact my ability to access rock climbing or back country skiing at any point in the year will make me very upset at the chosen 'solution'.	Ingrid Niesen	Website
5921	I love living in slc because of the access please do not infringe on access of some of the smaller user groups in the canyons. That will end poorly.	Brandon Kupczyk	Website
5922	<p>This problem has been in part caused by the greed of the resorts to make more and more money. They should be in part liable for helping to offset the cost to locals.</p> <p>Balance between the resort visitors and other users of the Canyon: Your three alternatives provide possible solutions for the increased number of visitors to the ski resorts. All three alternatives facilitate more access to the canyons but they do nothing for those that use the other areas of the canyon. Your trailhead plan is to reduce the number of parking spaces but not to provide any other alternative for users to access the trailheads. YOUR PLAN IS NOT BALANCED! It addresses ski resort use issues but does not address any other traffic or transportation issues in the canyons. Please serve all the users of the canyon and not just the ski resort users.</p>	Vaughn Cox	Website
5923	Leave LLC alone!!! Do not ruin what is one of the most beautiful areas in Utah for the sake of the ski resorts. Increase the buses. That's it. Encourage more carpooling. Who wants to an ugly, piece of garbage like a gondola going through the canyon?!!! Quit trying to make an I-80 up the canyon and PRESERVE IT AS IT IS!!!!	Cameron Wilcox	Website
5924	I am supportive of giving buses priority access in the existing lanes. The gondola does not seem to solve the issues currently being faced and I am scared about further scarring such a beautiful area with ultimately unproductive construction.	Nicholas Danziger	Website
5925	The proposed PARKING lot chosen is at the bottom of BIG COTTONWOOD CANYON Where do you think BCC skiers and recreationalists are going to park? I live at the mouth of BCC and do not want this area to shuttle people to LCC. It is unnecessary to put strain on BCC and attempt to hold both canyon traffic and parking. Especially during rush hour when residents are trying to get to their own homes. I don't see this being a well thought out plan.	Erin Salazar	Website
5926	Enhanced bus service, wider lanes, AND limits or fees on cars is my stance. Additionally, large, safe, monitored parking garages with bathrooms also seems mandatory in order to incentivize bus traffic.	emilie drinkwater	Website
5927	<p>I have climbed in the Wasatch for over 20 years. LCC is a world class climbing area. I am ok with increased buses up the LCC. Here's what I do not want:</p> <ul style="list-style-type: none"> • I do not want the road widened. This may impact climbing areas or water quality. People already drive too fast on that road. Don't give them a reason to go faster. • I absolutely do not want a gondola. This is only useful for the ski resorts, not for the people who will be paying for any of these alterations. • The parking area at the base of LCC needs to remain. How will people access the newly built Alpenbock trail? It is an important access point for many popular climbing areas as well as for hikers. • Do not 'improve' Gateway Buttress' parking lot. Not only do climbers, boulderers, picnickers, and hikers use it, but it serves as an access point for those wanting to go to the stream. No way is 21 spots enough. Do not eliminate roadside parking in that area. • Do not eliminate roadside parking near the ski resorts. Many recreationists need access to Hellgate cliffs, and backcountry skiing. 	Gary Beil	Website
5928	Any transportation solution for the canyons has to be as low profile as possible. The Wasatch is a treasure and we have to preserve it in as a wild a state as possible. Further development (ie: a gondola) erodes its wild status and would attract more people and more development to a canyon that is already suffering from too much of both. We have to save these wild places because once they're gone, they're gone.	Munro Alley	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5929	If skiing at resorts was the only priority and the only thing people did in the canyons then a Gondola is a great idea. That's not the case though. The enhanced bus option makes the most sense both from a cost standpoint and a flexible solution standpoint. Wasatch boulevard should certainly be widened with a dedicated bus lane and more parking areas should be added. Roads in the canyons should not be widened however, they are beautiful and delicate wilderness areas and the less construction in them the better. Yes, there is already a road but we don't need increase our impact if we don't have to. Widening the road would make the bus rides shorter but it's not worth it. Thanks for hearing my comments!	Kellen Busby	Website
5930	No gondola. The gondola would be way too negatively impactful.	Joshua Judkins	Website
5931	I want additional busses without road widening. I feel like you are trying to solve a problem that doesn't super exist. And haven't taken into account all the other non pay to play recreation that the canyon provides to our residents.	Jill Gorringe	Website
5932	I am not in favor of widening Wasatch Blvd. Alternative options should be pursued. I live just off of Wasatch Blvd and have certainly experienced the traffic involved, but accept it as part of living next to the Cottonwood Canyons. I think widening it into a highway would have negative impacts on residents along Wasatch Blvd since wider roads typically lead to increased road use (which then leads to more traffic, more local pollution, etc.) Find another way.	Jami Ballantine	Website
5933	DO NOT INSTALL A GONDOLA. As an avid backcountry skier, none of these solutions are accommodating. I would vote for increased buses and the canyons should charge admission like millcreek and offer a season pass model. As a resident and home owner in the Wasatch Front and Salt Lake County, I would like to voice my support for the simpler public-transit alternative, i.e., Alternative #1, as described in the LLC EIS. My choice is based upon these considerations: Given that Little Cottonwood Canyon (LLC) is a unique natural resource within proximity of over 1 million residents, and receives millions of visits per year – preventing further development of large-scale structures within the canyon should be prioritized, thus another gondola-type development is in the wrong direction. Better planned, and more accessible, public transport from throughout the SL valley could also lower the impact on Wasatch Boulevard and the parking crisis which exists at the mouth of both LC and BC canyons. By some assessments only 10 days per year actually overwhelm the uphill capacity of current alternatives. Therefore greater volume of bus and public transport could greatly alleviate the vehicle congestion, if provided in an efficient manner. The gondola alternative would seem to create different traffic jams (at the access and transfer points) at enormous cost, and irreversible cost to the landscape and ecology of LLC, and may not even be used at all in the non-winter months. Any transportation solution should be flexible enough to serve the many destinations, and many activities in the canyon, beyond the two resorts. The resort traffic, which admittedly drives the worst traffic situations in the winter, is overall not the greatest public utilization of the canyon. All the many other activities documented in the EIS are important for an improved transport system to serve, all year long. It is also true that, from our vantage in 2020, we are not able to predict exactly how the transportation needs will evolve, so the most flexible alternative should be favored.	Sam Pelletier	Website
5934	A liability of the gondola alternative, I did not see discussed in the EIS, is the potential disaster in the event of a power outage in the canyon (which I suspect happen nearly every year for short periods). How could all the passengers on 30, or even 15, full gondola cars be evacuated, in event of a power outage? Not without an enormous, expensive, and potentially dangerous rescue operation. There are other objections I have to the breadth of the EIS, i.e., how can LLC's problem be addressed without considering all the Wasatch Front canyons? But for now, please consider my choice of the three options offered. A concerned citizen, Harold Sears	Harold Sears	Email
5935	As a skier and rock climber I think building additional lanes would be a total disaster and would completely ruin many of the most well known bouldering locations in lower LCC. Enhanced bus service with no lane widening would be the best outcome. Gondola would be a distant second but I think that would also have a large negative impact on most recreation areas close to the road (think of the amount of litter thrown out of gondolas). Please don't ruin LCC bouldering by destroying some of the best areas with widening the road. I strongly support the so called "GONDOLA PLUS LA CAILLE BASE STATION" option. Let's get this right for our kids.	Kirby McCoy	Website
5936	Thank you for all of your time and careful thought in this matter.	Cliff Doner	Website
5937	This cannot happen, it will drastically take away from the environment and areas where people climb year around not to mention the impact of how many more people will now be flooding in the canyon. Not only damaging the wildlife but also the land.	Joseph Bucher	Website
5938	I prefer enhanced bus service without widening SR-210.	Kris Nosack	Website
5939	As a outdoor enthusiast and professional mountain guide (ski and climbing), I believe the enhanced bus service with no roadway widening is the most attractive alternatives of the three presented. None of the alternatives presented do much to address the needs of the dispersed recreation users. These options seem to be expensive and will have a high impact on the community and the tax payers as well as the environmental well being of our National Forest and Wilderness areas. All these options seem to address the needs of the ski resorts and their desires to increase their profit and ease of access while neglecting the many other canyon users as well as the industry that this supports. Backcountry skiing is growing faster than resort skiing and rock climbing and dispersed recreation is a growing and a substantial industry in Utah and Salt Lake. Not addressing the future needs of this community in favor of addressing the current needs of the ski resorts is doing the Salt Lake community and the national and international outdoor industry a great disservice. Access throughout the canyon is imperative to not only the needs of the dispersed recreation users but also spreads out the impact on our lands to a greater area, thus preserving it for future generations. A better and more sustainable solution needs to be found that addresses the needs of all users and the natural environment that will be able to last the test of time. Planning for now and the very near future is a wasteful view that leads to obsolete infrastructure and lasting environmental and financial impact while not solving the problem.	Christopher Brown	Website
5940	A gondola is not the solution for congested roads in little cottonwood canyon. This solution would permanently damage the nature and the skyline of little cottonwood canyon. Expanding the roads will also damage the nature of little cottonwood canyon. Increased affordable UTA and public transit (perhaps electric buses) as well as toll roads seems like a better solution to combat environmental damage while preserving the natural grounds as much as possible.	Elizabeth Porter	Website
5941	10-20 days of traffic per year is not worth the environmental and financial costs of these solutions. I say this as both a skier and as someone who lives in an area effected by the traffic. Traffic on a POW day comes with the territory. We can live with that.	Derek Tillotson	Website
5942	As a life-long resident of Utah, the place I most dearly call home is Little Cottonwood Canyon (LCC). Like countless other people, I go to LCC to re-fill my spiritual cup, to enjoy the splendor of the canyon. We are blessed. The decisions regarding transportation in LCC are very important to me and I take very seriously. Unfortunately, upon review of this draft EIS, I do not support any of the alternatives proposed here. The options presented here fail the user, the community, and the environment and further impact the values that make the Wasatch so awe-inspiring. This plan fails to consider and network with the transportation needs throughout the Wasatch front and as such is inadequate. The EIS process for transportation solutions in Little Cottonwood Canyon has betrayed the community and the tax payers who will pay a significant portion of this decision. The outcomes of this decision will seriously impact the people and the place. As an interested community member and tax payer, I was eager to hear the proposal for LCC transportation and attended the virtual meeting about the EIS Draft Alternatives in late June. The proposed solutions are wildly insufficient, will have huge environmental costs and further degrade the watershed and air quality through increased road surfaces and exhaust. In addition, the alternatives do not accommodate the needs of enough of the user groups. During the meeting, UDOT representatives clearly misled the public to believe that trains are not a "reasonable alternative", claiming that trains are too expensive and that this alternative would displace more than 50 homes. All of this is simply not true. During the EIS meeting, the UDOT representatives communicated lies. They mentioned that the train could not go up such a steep grade. Not true. They said the train would need two tracks the entire length of the canyon. Not true. They said the only route would need to be upslope of the road, this is ludicrous and also is of course, NOT true. They also mentioned that connecting this train to the existing network of trains would require displacing more than 50 homes. Not at all necessary and not true. This blatant stream of lies is despicable and disrespectful of the community, playing on the idea that the general public does not know any better and therefore lying to the public would allow people to buy into the idea that trains are not a "reasonable solution". Meanwhile UDOT, a road company, determines that two of the three "reasonable solutions" include major road infrastructure and improvements to accommodate more cars and more buses. The need for improved transportation in LCC has been pursued since the 1970s. We can do better. After decades of work and an impossibly large sum of money spent, our sophisticated solution to this transportation challenge is buses...really??? What century are we living in? There needs to be better forward, innovative thinking. This is not rocket science, the residents and visitors to this state deserve better, not to mention the wildlife, water and air. As for the proposed "reasonable alternatives" the gondola seems like the best of the three options the public is given. That said, where will thousands of cars park right at the mouth of the canyon? There is no solution for that, so people will need to park cars at hubs far away and take a bus to the gondola. This is a deal breaker for most users to need to take a bus and then change to a gondola...too cumbersome to do with kids. The parking hub solutions do not seem to serve people from Granite, Sandy or Draper or consider the burgeoning needs of Big Cottonwood Canyon and mass transit in general. This alternative does not serve users that are not heading to the ski resorts and to me this seems like an unacceptable attribute. Basically, this means there will continue to be extraordinary pressure of cars in the canyon, one of the core goals to solve with this proposal. In addition, the long-term (40 plus years) maintenance of such a solution will be costly, likely well in excess of a long-term investment of a train. The worst part about the bus alternatives is the associated road widening and avalanche sheds. These actions will have serious impacts to the hydrology and erosion in the canyon with modest improvements in transportation. Likely road widening will result in an increase of annual car transport in the canyon. Of course, increasing bus service will help, why have we not implemented that to a greater degree yet? Likely because there is not sufficient parking infrastructure in place to accommodate the cars. Of course, parking hubs need to be created in multiple locations north, south and west of the canyon. Why does increasing buses require road widening?? Widening roads whether it is the canyon road or Wasatch boulevard only increases cars, idling and exhaust. Isn't the goal of this project to decrease car use and increase transportation alternatives? I feel strongly like we should be designing transportation solutions around the values we seek in the Wasatch, allowing people to enjoy the environment, views, wildlife, water and air quality. We should not be designing experiences that are dictated by transportation. Transportation is a tool that will help or hurt those values. I am entirely disheartened by this effort and hope none of these alternatives are put into place. As a tax payer, resident and lover of LCC, I do not support the expansion of roads proposed here.	Erica Allmen	Website
5943	Hello, I am against the gondola proposition due to the fact that it will alter the mountains forever and prevent use of certain areas. Not to mention it will be a huge blemish on what is such a beautiful area. There are only about 10-12 really bad congested days that cause worry to make a change as drastic as this. There has to be another alternative to the gondola that is in the best interest of the people and the environment.	Grant Kates	Website
5944	All these proposals require lane widening or significant development in the sensitive canyons which will kill the resource that has made them so popular. Please prioritize tolling and increased bussing without lane widening. Prioritize using private office parking garages near the base of the canyons that sit mostly empty on the weekends.	John Davis	Website
5945	Do the big gondola proposed from la Caille	Charles Von Stade	Website
5946	I use little cottonwood canyon, 60-70 times a year. The reason I come up there is to escape and snowboard ; building a gondola would spoil this area. For most of the snow season, I use the bus. I would like to see more buses, including in the off season of spring and summer. While the avalanche sheds sound like a good idea, I worry about how big they have to be as well as the problem of them getting filled and shutting down the road for days/weeks. We should be trying to add more buses with a frequency of every 5 minutes to see if it reduces traffic in the canyon. Tolling and charging for parking would be another way to reduce traffic and push vehicle occupancy up. Those should be considered BEFORE widening the road and building avalanche sheds. Giving buses priority on road closures would certainly get more people into buses, especially if the buses were free. Please consider adding more buses, including in the spring and summer for year round public transportation service in the canyons.	Joe Bateman	Website
5947	I would prefer enhanced bussing with more and improved park and lots lots in the valley. A gondola would only benefit the ski resorts and doesn't adress the the other uses people use the canyon for year round.	Shannon Esplin	Website
5948	Do not expand Wasatch Blvd. expanding will ruin this beautiful neighborhood I have lived in for 25 years. All political decisions are made from money but for once think of peoples lives. Do not expand! I would like to voice my support for the Enhanced Bus/No Additional Roadway Capacity in Little Cottonwood Canyon. I understand the dire need to solve the traffic solution, but I strongly disagree with altering the landscape of the entire canyon just to cater to skiers for Alta and Snowbird. As someone who recreates commonly in the lower canyon (for climbing and hiking), the roadway widening would create havoc on popular and historic climbing and bouldering areas. The gondola option would cause less damage but would be a massive eyesore on what is one of the most beautiful canyons in the world. A hiker atop the LCC ridge line shouldn't have to look down on a gondola making it's way up the entire canyon, turning pristine nature into one giant ski resort. Aside from voting for the enhanced bus/no roadway widening, I think that a payment toll should be introduced in the canyon. I know this has been discussed in the past, but having to pay to enter would deter people from driving alone in their cars and would encourage carpooling. Thank you for hearing my comments and I look forward to hearing your solution, and hope that you consider the long-term impact of our backyard.	Rachelle Hille	Website

5950	I support the gondola option and request consideration be given to make the base at the private La Caille lands.	Paul Mathews	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5951	<p>I wish to address the issue of how climate change will affect our ski industry. You cite a study in which the authors found that future snowpack would build up enough to support skiing 1 to 2 weeks later and snow could begin to melt at the base of the resorts 1 to 2 weeks earlier. Thanksgiving skiing would be gone and mid-winter snow depths could be 40% less than what has occurred historically. So by 2050, if the number of skiing visits would be similar or increased with population growth, they will all be jammed into the shorter ski season.</p> <p>The ski basins in the Park City are about 7,000 feet above sea level and, because of climate change, some local officials have wondered about the city's future prospects for hosting Winter Olympics without proper snow for Nordic events.</p> <p>As reported on NOAA's Climate.Gov, a hydrologist with the National Weather Service Forecast Office in Salt Lake City states that "the fraction of precipitation that used to be totally snow is changing to rain." NOAA data indicates that the snow-to-ratio has moved toward rainfall between 1949 and 2016 and the situation will evolve to just rainfall in 2100. The upper elevations of the Uinta Mountains may have snow, but the Wasatch Mountains will be snow free. In the meantime, I can envision where there would be times with snow in the mountains and rain at the mobility hub and I would be riding a gondola from the valley floor to the top of the lift while soaking wet from rain. Also, a gondola would permanently wreck the scenery of the Canyon on a year-round basis pretending to be a Disney attraction.</p> <p>The traffic problem is not full-time. It's only a part-time problem for commercial interests up the canyon. You have not included alternatives that offer flexibility and consideration of canyon users who do not (or cannot afford to) use resorts.</p> <p>Funding buses is a smart idea — UTA can be the fix, and an inexpensive and immediate solution, at that. It's also a sustainable investment, whereas pouring more asphalt and erecting cables up the canyon will only lead to more asphalt & contraptions in the long run.</p> <p>Your three alternatives are an overpriced subsidy to a private industry that is financially threatened not only by yearly seasonal snow pack but also by climate change. Carefully evaluate why you would want to monetarily reward special interests who are unable to accept limitations because of broader public human needs for clean water quality, shared wildlife habitat, and simple passive experiences with nature.</p>	Cheri Condie	Website
5952	I support the gondola option and request consideration be given to make the base at the private La Caille lands.	Paul Mathews	Website
5953	I think these alternatives need further consideration that take into account a much greater geographic scope. The problem doesn't begin with the mouth of LCC, it begins in neighborhoods with poor access to transit. Many of the alternatives don't consider backcountry users and are focused on road expansion, which only leads to induced demand and more congestion. I think a toll with equity concerns factored in should be considered, with an alternative free bus system to get people out of cars. None of these options solve the problem.	Nate Blouin	Website
5954	The gondola is the best option. Every other option still doesn't stop the amount of cars going up the canyon, and that is the problem. The solution should be focused on reducing how many cars drive up and impact the environment, not to increase the amount of people are getting up the canyon.	daniel demschar	Website
5955	I do not want a gondola or road widening in the canyon	Dana Strumbly	Website
5956	I support the "Enhanced Bus" option. The two other options have significant adverse impacts to the canyon, in particular resources in the lower part of the canyon. These two alternatives will also adversely affect access for dispersed users in the lower canyon, including hikers and technical rock climbers. As the current traffic problem is primarily associated with weekend ski resort traffic, it would be advisable to consider instituting parking restrictions at the resort on these days. E.g., limit parking to employee pass holders and a set number of prepaid visitors in order to redirect users to enhanced bus service. This seems more of a management problem than an infrastructure problem.	Robert Price	Website
5957	<p>The transportation decisions in Little Cottonwood Canyon are very import to ur family. We own property at the mouth of LCC (4118 Little Cottonwood Canyon Rd) that we are about to break ground on for our permanent home. This is 4 properties from the current park-n-ride lot. As climbers, backcountry skiers, and mountain runners, we deeply value and appreciate the natural resources of Little Cottonwood Canyon and look forward to living right in it.</p> <p>We are not interested in any alternative that involves a widening of the road. I believe any expansion of the road would only cater to increased motor-vehicle use in future decades and generations. The road is already a valuable artery for dispersed canyon recreation (hiking, climbing, running, mountain biking, etc.), and currently the only method for full canyon travel to Snowbird/Alta.</p> <p>I strongly support the Gondola alternative, as long dispersed canyon recreation access was still permitted via the road. I think the alternative requires the development of strong access definitions (ie. 8a-3p road only open to vehicles above White Pine for those lodging or residing in the canyon, 24/7 road open to private vehicles below White Pine for dispersed recreation, 8a-3p gondola open for travel above White Pine). I believe the gondola sets the best precedent for the future in protecting the natural beauty and resources of LCC. I believe this alternative would make LCC a unique place to experience, like the car free villages/canyons in Switzerland (Zermatt, Saas-Fee, Bettmeralp, Wengen, and Murren).</p> <p>I do think that Alta and Snowbird should directly bear some of the cost of any transportation alternative, as they will be primary benefactors of any solution.</p>	Brennan Crellin	Website
5958	Enhanced parking options, followed by more buses seems to be the best alternative. As someone who just moved to Utah I don't want to see one of my favorite parts of the Wasatch to be turned into a construction zone for who knows how long. This place is beautiful and theres a lot of people that want to use it, but UDOT owes it to the people of this state, who pay taxes, to not ruin the natural beautiful and essence of a place like Little Cottonwood Canyon. Imagine the NPS putting a gondola through the middle of the valley because it was a quick and easy instead of taking the time to figure out the right way to fix these issues.	Ian Dzilenski	Website
5959	Alt 1 more buses no road widening	RyLee Bradley	Website
5960	I live in Salt Lake City and snowboard on the weekends mainly at Brighton and Snowbird. The canyon traffic is horrible and the pollution is worsening. I waited in 3-4 hours of traffic to get from Salt Lake to Brighton this winter. I think the best solution is building a gondola. The gondola is more environmentally friendly and tourists will enjoy the scenic ride. Please do something to fight the congestion in our canyons!	Gretchen Quinlan	Website
5961	Gondola 100%	Christina Cummings	Website
5962	I believe a gondola would forever change the face of little cottonwood forever. It is the gateway to over developing the Wasatch.	Emily Draper	Website
5963	All of these options are based purely on getting people to the two private ski resorts. While I understand that this is the majority of canyon users in the winter months, you are neglecting to the see the hikers, backcountry skiers, and climbers. There definitely needs to be more options for us to park and use the rest of the canyon all year.	Nash Mader	Website
5964	Gondola 100%	Eliza Shaw	Website
5965	We don't need it, carpool, bus, repeat.	Jackson Boss	Website
5966	Additional bus service seems like the best option. This would ensure continued integrity and crowd management of Alta/Snowbird, and maintain the premise upon which these pristine resorts were built. Traffic serves as a deterrent to those not fully committed to the sport, and looking for a more generic experience. Traffic would continue to serve as such if additional bus lanes and gondola construction continues to be avoided in Little Cottonwood Canyon. While potential profitability aspects are important, the resorts have always been particularly unique, and as such remains appealing to skiers far and wide that are truly passionate about the sport. Alta/Snowbird should aspire to continually remain unique, and additional buses would align with this strategic vision.	Janet Fugarazzo	Website
5967	I have read the entire EIS report and definitely feel the gondola is the way to go. The first road option really doesn't solve the problem. The second one ruins the esthetics, solves only 3 out of 64 avalanche paths, has a bigger environmental impact, and there would still be busses getting stuck – for more money than a gondola. Snowbird supports the gondola idea too, and offered 1000 acres on the North side of LCC road as a conservation easement if that option is chosen. I totally agree that the LaCaille solution is necessary to support people coming from Sandy and areas South so they don't have to go all the way up to the gravel pit at BCC. Additionally, as an avid backcountry skier, I would love to see the angle station at Tanner flats allow loading and unloading to open up access for these activities. This stop would provide access to both Red Pine and white pine areas and also provide an opportunity for an additional source of revenue to the Gondola project.	John Henry	Website
5968	Gondola 100%	Frank Shaw	Website
5969	NO GONDOLA PLEASE!! ITS NOT THE RIGHT MOVE TO SAVE AND PRESERVE OUR WILD NATURAL CANYON. DONT TURN IT INTO AN AMUSEMENT PARK!	Cole Addison	Website
5970	We cant even get a bike lane or new trails on the canyon but we can subsidize a gondola to for private ski resorts that dont even pay market value for the land they lease from the National Forest. We are willing to put in a gondola with over a hundred towers that only stops at ski resorts without stops at trailheads thus having a road with traffic and a gondola on the canyon. Where is the solution with that. At least make the canyon car free like europe does. Also why the rush to opt for a gondola without at least trying to toll the road or increase bus transportation that doesnt impact the canyon forever. It just sucks as a resident of Cottonwood Heights to see the total lack of respect or consideration of the community that deals with ski resort transportation decisions. Worst of all this gondola is servicing a resort that discriminates against snowboarding and we are subsidizing their private country club. No gondola!!!	Forrest Gladding	Website
5971	None of the plans presented address impacts upon recreation year round in LCC, especially climbing access. Also, preserving the fragile alpine environments is in the best interest of all users as the water quality and environment in the mountains above directly impacts the valley below in the water supply. No gondolas, please.	Susan Sims	Website
5972	I submitted this electronically, but in case it helps her is the letter in word format. Thanks.	Del Draper	Email
5973	<p>Hello,</p> <p>My name is Kristin Gavin and I live in Salt Lake City and am an avid user of LCC--both in the winter and the summer. I appreciate the effort of UDOT to address the transportation issues up the canyon; however, I have serious concerns that the proposed options are not taking into account the numerous other user groups that reside in the canyon and only focus on private ski resorts. If taxpayer dollars are going to be used to pay for these changes, than I would hope that we consider the impact on other access areas of the canyon--specifically the climbing areas. Option 2 would directly affect the current climbing zones up the canyon. The Salt Lake Climbers Association has spent years contributing to the cleanliness, care and trail systems of these climbing areas and the canyon as a whole and have definitely earned a right to have a say in this decision. While I would currently vote for Option1, I don't feel strongly that this option would provide lasting change that we're looking for.</p> <p>I hope the conversation can continue until we find the right solution that addresses all user groups year round.</p> <p>Thank you, Kristin Gavin</p>	Kristin Gavin	Email
5974	Please do not put a gondola or a third-lane in LCC. Widening the road will alter the hydrological and geomorphological aspects of our watershed and landscapes. Increase, light, noise, and air pollution. Please keep our canyons pristine and reduce traffic by means of tolling and permitting.	Ronnie Button	Website
5975	I strongly support option 3 the gondola. It is clear to me that the gondola is a Very good long term solution to a critical problem. Snow sheds and widening the road are Short term and inadequate solutions and will only have a negative impact on the environment. I urge the commission to make a decision in favor of a gondola. Sincerely, Sarah Tresfort	Sarah Tresfort	Website
5976	<p>I am very much opposed to the building of gondola in either canyon. Reading through the proposal it strikes me how terribly resource heavy that solution would be. I am much more interested in building overpasses where avalanches are frequent and increasing bus services (from town, and not just from the base of the canyons). Not having to change three buses would certainly be a huge incentive to riding as opposed to driving. Buying the mine and building a hub is another move that would have multitude of positive environmental impacts. Gondola has none other than a mild convenience for a resource rich population. Please treat all of our community with respect.</p> <p>To sum it up: No to gondola!</p> <p>Best, Emina</p>	Emina Alibegovic	Website
5977	<p>Good morning. I write in support of the gondola proposal with the caveat that the stakeholders in the Canyon, Snowbird and Alta, need to help finance this project. Both resorts have accelerated traffic problems by choosing to join a multi-mountain pass program that has increased skier/riders numbers in the Canyon. If both wish to continue with that program than they need to pay for the impacts they create.</p> <p>Thanks,</p>	Michael Stahler	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
5978	I vote to add a gondola to the valley in order to prevent more pollution in our city and make it much less congested!	Adam Saucedo	Website
5979	I vote for a gondola! As a long time (1985) user of the recreational opportunities in Little Cottonwood, primarily hiking, climbing and skiing, I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing especially ice climbing and winter rock climbing. Thanks!	Brian Cabe	Website
5980	I would like to note that I support the Gondola with Mobility Hub. However, during construction, you must be very mindful of the impact that this construction will have on the local ecosystem. The Salt Lake Valley receives the vast majority of drinking water from snowmelt in the canyons, and any damage to the watershed for the sake of the ski industry will not be tolerated. I like this option because it gets cars off the road, also single-occupancy vehicles. Just proceed with caution.	Hunter Tuesday-Heathfield	Website
5981	I am for the Enhanced Bus Service Alternative, I am also for a canyon toll to incentivize personal drivers to use the bus system and to help fund the additional vehicles and maintenance.	Patrick Moore	Website
5982	No gondola, no extra lanes unless for buses in winter and bike lanes in summer. Yes to increased bus service. I still think tolling and paid parking are the best solutions to winter congestion.	Shaun Jacobsen	Website
5983	I use both Canyons in winter and summer. The plan for a Gondola is not feasible in Utah. I am from Europe and familiar with Gondolas. A Gondola with parking at the mouth of the Canyon does not take away the issue of traffic on Wasatch. There is also the length of time it would take to load. If everyone appeared at the same time there would be chaos. There are plenty of parking lots that are empty, especially on the weekend, around business hubs in Salt Lake County. It would be a service to businesses to identify parking hubs around the city where bus availability is frequent. This would take cars away from Wasatch and the mouth of the Canyon. Clean energy efficient buses that run on a regular rotating schedule to a bus depot at the mouth of the Canyon where there already is a parking lot is one solution. Transfers can then be made to Alta or Snowbird. This would take cars away from Wasatch and deliver skiers or hikers to their respective destination with little stress. Skiing bus hubs could take on a more winter recreation approach with restaurants available. The shopping center in Quarry Bend would make a perfect hub.	Janet Wade	Website
5984	The gondola has my vote with Alternatives 2, 3A, or 4A as well.	JASON HOLT	Website
5985	Enhanced bus with no additional roadway capacity seems to make the most sense to the most user groups. I do not support the Gondola and do not believe that it would bring a positive change for SLC, the community, and the canyons.	Joseph Jarrell	Website
5986	We vote for bus enhancement without additional lanes on Wasatch. Also, we like the snowshed construction with road realignment. What are you going to do to quickly remove gondola riders in a lightning storm or equipment breakdown? I would not like to ride the gondola or bus with my wife and several young kids and all the needed equipment and clothing. Buses need to add a way to carry skis/boards on the outside. Please do not ever allow Park City people to come to the Cottonwood Canyons via a short-cut road/tunnel/gondola; it would quickly add too much more congestion on the slopes.	Ron Helen Roberts	Website
5987	I have been a snowbird passholder for over 10 years and snowboard over 100 days a season. I believe improved bus service with CNG buses and better park and ride combined with more parking that gives best spots to 3 person+ carpools solves the problems far better than a massively expensive and environmentally damaging gondola in the water and viewshed. As we know, weather can impact trams and gondolas. Fix the current model as the upper canyon resorts can only handle so many people at once anyway. We were near a max last season in terms of reasonable user level.	Robert Macfarlane	Website
5988	I support the gondola plus La Caille Base Station.	Val Oveson	Website
5989	The best choice is the ENHANCED BUS WITH ROADWAY WIDENING FOR PEAK PERIOD (SHOULDER LANE) in LCC. The bus has to go faster than private cars. Its the only way people is going to stop driving their own cars up the canyon.	Joaquin Fischer	Website
5990	NO GONDOLA NO ONE WASATCH OR CONNECTING OF ANYMORE SKI RESORTS KEEP OUR BACKCOUNTRY FOR THE FUTURE GENERATIONS! WE NEED ELECTRIC BUSES OR NATURAL GAS HYBRID ELECTRIC BUSES MORE BUSES PER SINGLE STOP TIME FOR BOTH BIG AND LITTLE COTTONWOOD WE NEED TO ADDRESS BOTH CANYONS AT THE SAME TIME OR WE WILL ALL BE IN THE SAME MESS COME NEXT FALL DO YOUR PART AS COUNCIL AND COMMUNITY LEADERS TO MAKE THE RIGHT DECISION FOR THE PEOPLE AND NOT THE CORPORATE INTRESTS!	Zack Mortensen	Website
5991	I think the gondola option with the La Caille base is the best option. It is a one-seat ride up the canyon, no need to transfer. The existing gondola proposal is useless without sufficient parking at the base. Any bus option is a waste of money because no one likes busses and they're therefore underutilized and unused.	Michael G	Website
5992	Hello, I am in support of enhanced bussing and add my support to this plan. I favor this alternative over road widening and the gondola as it has the smallest environmental impact and an already strained canyon. Additionally, I believe this plan reduces the possibility of interconnect and development of prized backcountry areas by ski resorts. One main concern I have with bussing is setting up sufficient parking space to support the amount of bussing traffic. Currently the Wasatch lot fills up on a good powder day by 8:30 at the absolute latest. More infrastructure is likely needed to support enhanced bussing. Unfortunately I do not believe people will bus from centers near their home, but will still look to congregate near the mouth of the canyon. One last thought I have is adding tolls during peak hours to help fund the bussing system as well as discourage cars from driving up and overcrowding little cottonwood. Thank you for your work and taking the time to hear my thoughts! Cheers, Taylor Meadows	Taylor Meadows	Website
5993	I reviewed the plans for adding lanes to Wasatch Blvd from the mouth of Big Cottonwood Canyon heading toward Little Cottonwood. I do not approve of either plan of the two. It appears to widen Wasatch Blvd until it nears Giverny Development when it returns to a 2 lane road. It also widens Little Cottonwood Canyon Rd until just south of the split. Neither of these plans will help with commuters who are year round. It would only assist (somewhat) with ski traffic who travel these roads from Nov/Dec until March. All of this road work and change for a 4 month period of time? This makes no sense. I live near that split when Little Cottonwood splits from Wasatch. These plans would only increase air pollution and noise pollution near my residence. I believe other plans need to be investigated. Thank you.	Diane Forster-Burke	Website
5994	Just enhance the buss system please. A gondola would be slow, prone to malfunction, and a terrible eyesore. Thanks	Jason Taylor	Website
5995	All these options are crap and don't take into consideration climbing/biking/hiking and should be suspended until better alternative o options could be explored to take other outdoor communities into account. And for the love of God don't put in a gondola. I've never skied snowbird or Alta and don't plan on it, but this restricts my access to grizzly gulch and other Backcountry skiing areas.	Bryce Klinger	Website
5996	I support the enhanced bus option WITHOUT road widening. The road widening and the gondola options would be detrimental to the natural landscape in little cottonwood canyon. It is not just a road for skiers to get to/from the resorts; the road and the land surrounding it is utilized by many different user groups. It would negatively affect everyone from the residents to the day hikers to the climbers to the backcountry skiers that utilize that canyon. The road problem is not a taxpayer problem, it is a ski resort problem, and the impetus needs to be on them to come up with an environmentally friendly solution funded with their money, not tax dollars. Alta and Snowbird could invest in parking structures in the Valley and provide shuttle services to and from their resorts. They could charge for parking permits at the resorts or offer free parking to those who carpool to incentivise less traffic on the roads.	HALEY DAHLE	Website
5997	The traffic up the canyon is a problem, and I appreciate the effort that UDOT has put into solving it, but none of the options presented are feasible without severe negative effects. If UDOT must do something, a few other options to consider. 1. Charge a day use fee for any vehicle entering the canyon, excluding residents, employees that work in the canyon, and people that are carpooling. That would dramatically cut down on traffic. 2. Consider one way traffic using both lanes for certain hours of the day when traffic is heavy. IE, only upward traffic from 6-8 AM and downhill traffic from 4-6 PM. Thank you for your time and consideration.	Kathryn Fitzgerald	Website
5998	I prefer the aqua bus enhancement option as solving the most problems for the greatest number in of people. Thank you for the very clear chart. To Whom it may concern, First, the lack of identifying a carrying capacity is a serious flaw in the 'purpose and need' component of the EIS. An 'unlimited' capacity would therefore appear to be the desired outcome without ascertaining this value. This is harmful to our watershed and environment long term. Please reconsider. The gondola is a poor choice because it will not improve flow due to the subsequent attraction of visitation being offset by any efficiency. In short, more people will arrive for the amusement park atmosphere, and more congestion will ensue. It is also too environmentally impactful overall on the ecosystem. It does little for non-resort patrons, and will not run 24/7 to help with emergency egress. Besides, the worry of emergency egress is over blown, and primarily a tactic for economic gain of a few well positioned entities. Widening of the road has similar negative impacts on the environment, and never gets to the root of the problem - build it and more people will cluster into the canyon with no net improvement in function after a short time. I favor more busses and NO road widening. An electronic toll at the canyon entrance, coordinated with traffic flow in Big Cottonwood Canyon (and a toll for that canyon as well), would be the best option amongst the choices. The toll could help pay for more busses, valley parking, and road maintenance. Resorts operating in a environmentally sensitive watershed should realize they have intrinsic limitations on their business model, and should respect their chosen circumstance, instead of continuously trying to change the rules that govern their location. Watershed values need to be the priority, not private equity. Thank you.	George Vargyas	Website
5999	Please accept the attached letter as public comment from Cottonwood Heights for the EIS Draft Alternatives. Thank you, Mike Johnson Community & Economic Development Director Cottonwood Heights	Mike Johnson	Email

6000	Our canyons need to be preserved as much as they can be while accommodating for their growing popularity. Enhanced bus systems with a dedicated shoulder and a gondola would severely impact the already greatly impacted natural environment, they are unnecessary and would leave permanent detrimental consequences, more people from both the local areas and out of state would be invited to frequent the canyons if these options were pursued, consequently creating more traffic in the canyons, further destroying the natural beauty of the original Goshute, Ute and Eastern Shoshone lands. We need to be preserving these lands to the best of our ability, and not destroy them further, this is why I and many others I know, support solely an enhanced bus system, which will help reduce traffic congestion at the same time as conserving and preserving these natural lands.	Melissa Koch	Website
6001	I worry that a gondola will disrupt the natural beauty of the cottonwood canyons. I grew up frequenting the canyons in all seasons, and while the congestion and parking is definitely a problem, we need to find a way to solve it that does not involve destruction of natural areas.	Mimi Andrews	Website
6002	I care less about which option happens, and more about the fact that Alta and Snowbird are not covering these costs. Taxpayers should not be funding these as their direct purpose is bussing more tourists to spend money at those two private businesses.	Simon Fraser	Website
6003	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on disperse recreation in the canyon. I do not support the destruction of wildlife for tourism. To Whom It May Concern,	Reise Rasmussen	Website
6004	Attached is my letter of support for the gondola option at La Caille station in Little Cottonwood Canyon. Thank you, Deidre Henderson Utah State Senator District 7	Deirdre Henderson	Email
6005	I think they should cancel the ikon pass in the canyon and see if that works first. Due to covid we should not be encouraging people to come here from out of town to further spread the disease here. Maybe with no ikon we wouldn't even need to be exploring these other options. Too bad greed outweighs customer satisfaction. I've lived here my whole life and I feel like I'm getting ran out by out of towners. No ikon, no other options needed.	Mark Edlund	Website
6006	I support the enhanced bus option. It has the least environmental impact	Lee Rasmuson	Website
6007	GONDOLA WITH BUS FROM MOBILITY HUB NO ADDITIONAL ROADWAY CAPACITY IN LCC	Brian Stillman	Website
6008	Make sure we have access to all the beautiful hiking trails.	Brittany Hawkins	Website
6009	Please don't take the gondola option. These spaces need to remain in their natural state as much as possible.	Dan Moseson	Website
6010	Better bus service is the best solution. I used to take the bus from 3900 until the schedule changed. The 6200 lot was often full of people. This is clearly a solution that people would be willing and able to utilize. I met tourists who took the bus from downtown SLC, so it is a solution that can help businesses attract tourists. Better parking lots and better bus service would encourage people to take the bus. The bus should also be free from anywhere or perhaps free with a lift ticket purchase. A gondola would take forever, be expensive and might not accommodate back country skiers, sledgers, and snowshoes, who also deserve access. And there is no way the parking will work. The proposed mobility hub would hit traffic of people going up Big Cottonwood. Especially in the morning, everyone wants to go up around the same time. This also would benefit people north of the canyon, but what about all the people south and west? Buses allow parking to be more spread out around the Valley. Gondolas might seem cool because they're European, but buses would be better and cheaper.	Daji Landis	Website
6011	My support is with the enhanced bus and roadway extension.	Terry Huff	Website
6012	Without going into the past and what has put us in this position I think the enhanced bus service with road widening is the best option. The LCC road situation is what this is all about—snow sheds in the right places will change the game on snow days (prevent the madhouse at the bottom waiting for the road to open), and the extra lane flowing with traffic will be a remedy for big-crowd-clog-the-road days both heading up and coming down. Theoretically. When putting in that extra lane in LCC make room for an eventual train line that will not be an eye sore like a gondola and will provide opportunity down the road to evolve into better improvements in the future. Make room for it now so when it comes time to restrict the impact of vehicles and go a la Zermatt it doesn't become a go back to square one project. Make the room under the snow sheds for the eventuality of a train in a way so the snow sheds don't have to be reconfigured. I think looking forward to the next part of this is the only way to do it - this is all so woefully late and the longer it goes on the worse it is expense wise and impact wise. Since we are stuck playing catch up now let's try and be more prepared for what's coming.	Lee Cohen	Email
6013	Another issue all together, related more to the ski areas and the skier experience, not UDOT lift lines now are a function of parking. Since I ski most at Alta I'll use Alta as an example here. On big crowd days Alta has a clog early but lift lines almost always thin out after a two or three laps - it's because lift lines are a function of parking - the amount of cars parking is the main factor, and the way it is set up now it works like that. If there is more parking there will be more people. If off site parking becomes a factor it could get way more crowded. One thing will never change - a huge part of the quality of the ski experience is directly related to the amount of people skiing on the hill.	Sally Kaiser	Website
6014	None of these alternatives are good. Back to the drawing board.		
6015	I support the bus with road widening option, but the extra lanes should be limited to buses only in winter and to bikes/peds only in summer. We should not allow cars to access the widened lanes. We should be reducing the number of cars traveling in the canyon and increase the public transportation options.	Bridget Koza	Website
6016	I support the enhanced bus alternative without widening the roads As a Salt Lake City resident and frequenter of our local canyons and ski resorts, I am strongly in favor of simply adding more buses without any road widening in Little Cottonwood Canyon. Thousands upon thousands of people love LCC -- and it's OUR responsibility to take care of it. Rather than harm the canyon, add more infrastructure and development, and take away from the beauty of the canyon itself, we as humans should be the ones changing our behavior. We are the ones that should be adjusting the way we approach recreation, making small sacrifices and slightly inconveniencing ourselves. Taking a bus up LCC should be the norm. We should not put the burden onto the canyon itself. A gondola is a terrible thing to add to this beautiful canyon and will take so much away from the beauty the canyon offers us. Widening the road will do the same. Please, leave LCC alone and start a campaign to normalize bus riding. Use the methods of Social and Behavior Change Communication to get more locals and tourists to see riding the bus as part of the experience. If we can shift the way we view buses--and yes, if we can make it easier for us all to hop on a bus--that can do SO MUCH more than tearing up the canyon for more development.	Christopher Draper	Website
6017	I would like to build on my previous comment for support of the gondola, by further stating that I support the La Caille base station option.	Otto Lang	Website
6018	I support the gondola and La Caille base station option.	Peyton Valko	Website
6019	As a resident of Cottonwood Heights, I am deeply concerned with the proposed options that UDOT has for the Cottonwood Canyons, and ESPECIALLY Wasatch boulevard. I am sending formal comments on behalf of residents of the household (8822 S Blue Jay Ln, Cottonwood Heights, UT 84121) that we are all against all three proposals, specifically because each proposal requires widening of Wasatch Blvd. We do not believe widening Wasatch Blvd is an acceptable solution. We are for increased public transit options, including dedicated bus service and more transportation hubs with ample parking to access buses and carpool solutions. In the reading of each of the plans, each plan essentially includes a two component solution: Increase public transit options Infrastructure improvements to increase throughput. NOTE: All of the plans call for a widening of Wasatch as part of that, but this only serves to cause further congestion and problems in the neighborhood. Broadly I agree that some form of viable and reasonable public transportation solution must be part of the solution. However, in my own attempts to use public transportation to access the canyons, I found it difficult even with the free bus pass I receive with my ski pass. For example the bus was frequently late, there appear to be less bus stops as of 2019 than in previous years (elimination of the stop at the mouth of LCC). As a resident, it simply does not seem viable to use the public transportation available today in large part because it's inconvenient. Additionally, families are the LEAST likely constituent to use the current alternatives simply because they aren't family friendly. It's not clear to me that any of the plans under review today address this issue, despite their modest goals of a 30% increase in ridership. Each of the three proposals include plans to essentially INCREASE the throughput of traffic on Wasatch Blvd, but UDOT has stated that the goal is to reduce the traffic by offering public transportation alternatives. Increasing the throughput on Wasatch blvd will only invite more people to drive their own cars versus take some form of public transportation, especially those underserved families with children. My concern is the widening of Wasatch will only invite more cars to travel up the canyons, and cause more issues in winter and in summer. I personally cannot see how drastic proposals such as a gondola (which only serves one canyon, and has numerous externalities associated, such as parking for example) or widening Wasatch are an adequate solution. These plans are incredibly costly and contain externalities that are being glossed over (impact of a wider Wasatch blvd. to property values and quality of life in Cottonwood Heights for example). The traffic issue in Little Cottonwood canyon exists in the broader context of the Salt Lake Valley mobility issues. NONE of the proposals talk about how they fit into a broader plan to increase mobility in the valley with public transportation (likely why people view these plans as self-serving for the resorts). These proposed "fixes" will only create more issues that will need to be mitigated and managed in the future. I sincerely hope that representatives from UDOT, Cottonwood Heights, and the surrounding areas take a moment to reconsider these issues and the proposed options before bringing any of them, or any alternative proposals forward. These are not solutions. They are single-focus, ill-conceived notions that place an unwanted and significant burden on the communities they are seeking to serve without solving the problems that they intend to solve.	Christopher Mahoney	Website
6020	I supports the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on disperse recreation in the canyon.	Paula Despain	Website
6021	Please don't ruin the canyon for non ski resort recreationists. The widened road and gondola only seem to benefit the businesses in the canyon and not those bikers, skiers and climbers that also use the canyon. Please consider the enhanced bus plan without widening the roads.	Matt Jones	Website
6022	I prefer the gondola. The t-intersection at Wasatch needed to be looked at further. Please consider a protected style intersection to safely accommodate the people riding bikes in this area. By having a properly designed intersection, you will remove the amount of conflicts between different users, and make it safer for everyone. Safety for everyone needs to be your priority. People on bikes, in vehicles, and on foot will be there whether you provide a safe space for them or not. Just spending 10 minutes looking at this intersection, there is some obvious changes that can be made easily.	Blair Tomten	Website
6023	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on disperse recreation in the canyon.	Jean Rasmussen	Website
6024	I supports the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on disperse recreation in the canyon.	Emily Rasmussen	Website

6026	Please see the attached letter from Derek Miller, President & CEO of the Salt Lake Chamber. Please let me know if you have any questions or concerns. Thank you!	Derek Miller	Email

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6027	<p>I am submitting this official comment on behalf of Wasatch Backcountry Alliance and the thousands of members who we represent.</p> <p>In our comment regarding the original EIS Scope and Need process in May 2018, Wasatch Backcountry Alliance's comment began with this statement: "Wasatch Backcountry Alliance (WBA) envisions a low cost, low emission, energy efficient year-round multi-modal transportation scenario for improving the current traffic situation in Little Cottonwood Canyon (LCC). The system we envision must be capable of providing efficient and predictable service for travel to both developed locations (ski resorts) and to trailheads and other stopping points for dispersed use in LCC. Any improvements being made in LCC should be tied in to a larger transportation system that serves and benefits the entire Central Wasatch." To that end, with regard to the current LCC EIS, WBA supports enhanced busing with no widening of Highway 210.</p> <p>WBA firmly believes that before any transportation system is selected, there must be a thorough analysis of the carrying capacity of Little Cottonwood Canyon. This will help establish the volume of people that need to be moved up and down the canyon, which will invariably help determine which transportation system best fits that purpose and need. WBA strongly encourages UDOT to work with other stakeholders, including the US Forest Service and Salt Lake County, to undertake a carrying capacity analysis and to make that part of the current EIS.</p> <p>With regards to the two options that use more buses (extended bus service and widening of the LCC road to accommodate yet-more buses), WBA continues to support the same concept that we stated in our May 2018 Scope and Need comment: "The transportation system should use the best currently available technology to serve all user groups on a year-round basis. WBA believes that the best currently available technology that meets our criteria is a flexible and dynamic fleet of energy efficient buses and vans using a series of transportation hubs." At this point in time, we do not think that Highway 210 should be widened to accommodate more vehicles, but that having dedicated times for buses and cars with 4 people (ie. 7-9am and 3-5pm) should be more thoroughly explored.</p> <p>The most-recent EIS document clearly reflects a lot of work done on the part of UDOT, but it also generates many questions and we feel there are some important fundamental flaws that should be addressed. To that point, we have some comments about what we regard as key issues with this EIS:</p> <ul style="list-style-type: none"> > The current EIS does not address the concept of multiple Mobility Hubs other than the one on 9400 South and the one at the Gravel Pit. WBA thinks that the transit system needs to originate at locations around the valley (ie. U of U/Foothill, downtown, airport, WVC, Draper, West Jordan and points farther south, etc.) so that people can access the bus where they live, rather than drive their car to a mobility hub to catch the bus. When faced with this choice, we suspect many people will choose to remain in their cars rather than use the bus. > There is very little discussion of the needs of non-ski resort, dispersed users (in particular with regards to the White Pine trailhead, which has already increased in use to the point where it's dangerous due to on-highway parking in both summer and winter). > We do not see any financial life cycle analysis (capital and operation, maintenance) of any of the options presented over the projected timeframe. Given that the least-expensive option will come at a cost of ~\$100 for every single Utahn, this is relevant). > There is no mention of any interim solutions, and according to a UDOT spokesperson, UDOT has "no idea" what to do in the interim, nor are there any approximate timelines to actually identify what the "interim" is. LCC is facing an acute problem now that will only worsen, and the lack of timelines is a major missing component of the EIS. > There is only token consideration given to the effects of each of the options on the vital LCC watershed, either by construction or ongoing use. > There is very little/no mention of tolling on vehicles, though it is our understanding that the Utah state legislature specifically allocated considerable monies to UDOT to consider tolling, and as noted above, the Wasatch Backcountry Alliance is a proponent of tolling. > The EIS provides no rationale for UDOT's winnowing of 35 different options to these three. <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Brad Rutledge	Website
6028	<p>I support snow sheds and enhanced bus service WITH MANDATORY SKI AREA PARKING IN THE VALLEY. Improved Forest Service access/facilities/parking would be nice too.</p> <p>I recreate and work on the public land in Little Cottonwood Canyon so I will be directly affected by whatever ends up happening. Any solution that benefits the resorts at the expense of the tax-payer or does not address the needs of non-resort users should be taken off the table.</p> <p>Widening the road for anything other than public transit will only encourage more people to drive. An absurdly long gondola from the base of LCC to the ski resorts, with no stops at popular trailheads is a grave misuse of public funds and only opens the door to more ski area expansion, which we should all oppose. Driving to a transit center to get on a bus to ride to the gondola base station to take a gondola to one of two ski resorts is a ridiculous idea because nobody will ever do that.</p> <p>ALTA AND SNOWBIRD ARE THE PRIMARY DRIVERS OF CONGESTION IN LCC AND COTTONWOOD HEIGHTS. If the ski area profit centers at the top of the canyon insist on continuous growth, they should be heavily subsidizing whatever transportation solutions are necessary for that growth, not the tax-payer. While I'm not opposed to a toll at the base of the canyon to limit congestion and provide funds for PUBLIC ACCESS improvements, I find the idea of paying parking fees to a private entity so that I can access public lands morally and ethically reprehensible.</p> <p>We are long overdue for a solution. The growth along the Wasatch Front and Back requires that this solution be built for what the canyon will look like in 50 years, not for what it looks like today.</p> <p>Hello,</p> <p>As a resident of Cottonwood Heights, I am deeply concerned with the proposed options that UDOT has for the Cottonwood Canyons, and ESPECIALLY Wasatch boulevard. I am sending formal comments on behalf of residents of the household (8822 S Blue Jay Ln, Cottonwood Heights, UT 84121) that we are all against all three proposals, specifically because each proposal requires widening of Wasatch Blvd. We do not believe widening Wasatch Blvd is an acceptable solution. I am sending formal comments on behalf of residents of the household (8822 S Blue Jay Ln, Cottonwood Heights, UT 84121) that we are all against all three proposals, specifically because each proposal requires widening of Wasatch Blvd. We do not believe widening Wasatch Blvd is an acceptable solution. We are for increased public transit options, including dedicated bus service and more transportation hubs with ample parking to access buses and carpool solutions.</p> <p>In the reading of each of the plans, each plan essentially includes a two component solution:</p> <p>Increase public transit options</p> <p>Infrastructure improvements to increase throughput. NOTE: All of the plans call for a widening of Wasatch as part of that, but this only serves to cause further congestion and problems in the neighborhood.</p> <p>Broadly I agree that some form of viable and reasonable public transportation solution must be part of the solution. However, in my own attempts to use public transportation to access the canyons, I found it difficult even with the free bus pass I receive with my ski pass. For example the bus was frequently late, there appear to be less bus stops as of 2019 than in previous years (elimination of the stop at the mouth of LCC). As a resident, it simply does not seem viable to use the public transportation available today in large part because it's inconvenient. Any public transportation alternatives have to address convenience and ease of use (for example reducing or eliminating transfers, bus to gondola for example) and include consideration for the broader transportation and mobility issues that exist in the valley today. Additionally, families are the LEAST likely constituent to use the current alternatives simply because they aren't family friendly. It's not clear to me that any of the plans under review today address this issue, despite their modest goals of a 30% increase in ridership. The current transportation alternatives do not appear well thought out or considered.</p> <p>Each of the three proposals include plans to essentially INCREASE the throughput of traffic on Wasatch Blvd, but UDOT has stated that the goal is to reduce the traffic by offering public transportation alternatives. Increasing the throughput on Wasatch blvd will only invite more people to drive their own cars versus take some form of public transportation, especially those underserved families with children. My concern is the widening of Wasatch will only invite more cars to travel up the canyons, and cause more issues in winter and in summer.</p> <p>I personally cannot see how drastic proposals such as a gondola (which only serves one canyon, and has numerous externalities associated, such as parking for example) or widening Wasatch are an adequate solution. These plans are incredibly costly and contain externalities that are being glossed over (impact of a wider Wasatch blvd, to property values and quality of life in Cottonwood Heights for example). The traffic issue in Little Cottonwood canyon exists in the broader context of the Salt Lake Valley mobility issues, NONE of the proposals talk about how they fit into a broader plan to increase mobility in the valley with public transportation (likely why people view these plans as self-serving for the resorts). These proposed "fixes" will only create more issues that will need to be mitigated and managed in the future.</p> <p>I sincerely hope that representatives from UDOT, Cottonwood Heights, and the surrounding areas take a moment to reconsider these issues and the proposed options before bringing any of them, or any alternative proposals forward. These are not solutions. They are single-focus, ill-conceived notions that place an unwanted and significant burden on the communities they are seeking to serve without solving the problems that they intend to solve.</p> <p>Thank you</p> <p>Chris and Jessica</p>	Chris Mahoney	Email

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6031	<p>Draft Alternatives and concerns:</p> <p>Gondola – against.</p> <ul style="list-style-type: none"> • It would totally disturb the natural beauty of LCC. • It would be dripping lubricants from all the towers (sheaves, just look on the snow under regular lift towers, VERY evident), each and every gondola (a 3S has two fixed cables that support and steady (against winds) the gondola) and the slack carriers have sheaves which drip lubricants. These lubricants will adversely affect water quality and this drinking water is VITAL for the Salt Lake Valley. • The towers will be an environmental hazard in their construction phase (vehicles, erosion, disturbing of soils over both access roads, any temporary or permanent bridges needed over LCC Creek for all towers on the South side. • The towers will also be a source of noise and visual pollution. • It also would NOT provide either extended hours or four-season benefits. • It also has both labor and operational expenses (especially power) during all hours of operation. These large O&M costs that would need to be shouldered by Utah taxpayers, for little benefit. • It also provides no benefits to any LCC users except ski areas, anathema to the majority of Utah residents who don't ski in LCC. • Since it is impossible to increase the throughput of a 3S gondola beyond its designed limit, it would also be a major expense for a permanent structure (destined to be a relic) that would only temporarily lessen traffic. • It would also lead to many more buses permanently traversing Wasatch Boulevard leading to an inevitable decrease in quality of life and property values for residents near that road. • The Gravel Pit Mobility Hub and "express" bus service to the gondola base station has MAJOR time estimate errors. UDOT assumed "articulated buses with a capacity of about 60 people per bus." Articulated buses do not have under-floor luggage storage bins like coach buses do. Where would 60 pairs of skis be stowed for the trip? How about 60-120 gear bags? They would either be all over the floor or occupying seats or both. What does this do to the time to load 60 people and all their gear? UDOT assumes 12 minutes from your car to being on the bus and ready for the bus to start moving. 12 minutes is hardly enough to find a parking space and get your gear out of your car (possibly out of a roof rack or aero-box). To say nothing of walking to the elevator (do you really think older folks or younger folks with lots of stuff or parents with kids and all that stuff will take the stairs?), waiting for the elevator, walking over to the counter, getting a ticket (if needed), then loading into a bus with gear all over the place, arguing with someone who put their gear on one of only seats left, trying to find seats together with your kids? Try at least 30 minutes, probably more like 45 minutes. Since the UDOT estimate of gondola travel time not including the bus portion is 51 minutes, this becomes 81-96 minutes. Since the UDOT estimate for traveling a personal vehicle up the canyon is 42 minutes you can see why this will NOT be utilized by many people at all, except by (economic?) force which is odious. <p>See below for its inadequacy in meeting the Utah Central Wasatch Commission's (CWC) Staff Recommended Mountain Transportation System (MTS) Attributes and Objectives.</p> <p>Enhanced Bus Service – against, especially the Snow Sheds (treated in a separate section since both Enhanced Bus Service alternatives include them). This applies to both "more buses" alternatives; with and without S.R. 210 widening.</p> <ul style="list-style-type: none"> • "More buses" has never worked long-range. As population and use increases, they become less and less effective. • Diesel buses are slow, noisy, odious, and very inefficient when not filled to capacity. Their fuel is not sustainable. Their particulate emissions are hydrophobic and cannot act as snowflake nuclei, possibly adversely affecting snowfall. They add to air pollution, not as much as the autos they replace, but they do add to air pollution. • They have major maintenance and fuel costs as well as replacement costs. • They are not attractive. Have you ever ridden a ski bus? I did it once, yes ONCE back 30+ years ago. I would not recommend it except to experience how obnoxious it is. • Two minutes to load a 60 passenger bus with all 60 people and all their ski gear?!? That is TOTALLY out of touch with reality. More like 30-45 minutes (see above). • Where do these articulated buses turn around? It's tough enough for regular coach buses to navigate in the ski area parking lots. If more cornering room is needed, that would eliminate more of the parking spaces leading to more roadside parking. • They are shut down during road closures and during avalanche control. • They would not provide either extended hours or four-season benefits. • No support to any LCC users except skiers, snowboarders, and some resort employees. Employees that need to be in before service starts or leave after service ends could not use the buses. <p>Snow Sheds – dead set against.</p> <ul style="list-style-type: none"> • Major environmental issues. Eliminate wildlife access to water (LCC Creek) for almost the entire length. Increased erosion. Drainage issues. • Ugly, destroys scenic viewing of the canyon year-round for very little benefit (a few days a year of closures). • Permanent damage to canyon. If a true solution is implemented the snow sheds will be an obsolete relic. • Major negative impact on climbing and hiking access. • Open-side columns are a safety hazard to vehicles and especially cyclists. I am a cyclist. The bike path outside the columns will almost never be used uphill and NEVER be used going downhill! Frequent concrete posts on one side, an unguarded drop-off on the other? After a VERY short time it will be coated with debris, sand and gravel, especially after a winter. How will it be cleaned well enough to be safe to ride on? How often? What about broken glass, thorns, blown debris? Going downhill!?! A death trap. What unthoughtful non-cyclist thought this up? Take that portion of the bike path out of the design. • The roadway shoulders under the show sheds will soon be littered with debris, especially towards the Jersey barrier protecting the columns from vehicles. No effective way to clean it. Cyclists will have to avoid it in order to avoid frequent flat tires and dangerous (or even deadly) falls. Is frequent street sweeping included in the O&M cost estimate? Not that I saw. • The 4' overhang puts all the eroded sediment, debris and water right onto the bike path. Idiotic. • Subject to landslide damage. • Subject to extended closures if (when) avalanches or mudslides or landslides get into it. I have heard of weeks long closures. Murphy's Law says "if anything can go wrong, it will, and at the worst possible time". I think Murphy was an optimist. • The earthen berm is idiotic and unrealistic in this scenario. To funnel an avalanche they need to be funnel shaped, so they cannot be vertical up the canyon wall or horizontal either. Imagine attempting to construct them on a steep, eroded hillside that is steep enough for avalanches. Impossible. They will be subjected to landslides, mudslides, and massive erosion. They would be a maintenance and environmental nightmare and enormous expense. Don't do them, we all will regret them! <p>S.R. 210 road widening – very much against.</p> <ul style="list-style-type: none"> • Will create very deep cuts into the hillside bank, creating erosion problems. • Deep hillside cuts will affect climbing access over very long stretches of road. • Deep hillside cuts will affect roadside climbing adversely. • Deep cut and wider road increases the volume of avalanche material to be cleared, increasing expense and/or time to clear. • Increases the scenic disruption greatly. • Encourages more cars instead of reducing the auto traffic. • Increases the impact on Little Cottonwood Creek as the road is already close to the creek in several places. • Would encourage higher three-season traffic speeds, endangering cyclists more. <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	David Stein	Website
6032	PLEASE choose Option 1. Should the taxpayers really be spending 100s of millions for access to two private businesses?	Zach Perzan	Website
6033	Loving the canyon to death. Question, if the purpose is to bring more people up the canyon, and that will ultimately result in more \$ for the resorts and to the State via Taxes, then, will those resorts be turning over their parking lots to the State as well? Or converting their no longer needed parking lots to more hotels, thus resulting in even more traffic and causing a vicious circle. Follow the consequences before deciding.	Sheila White	Website
6034	<p>Hi! As a year round lcc user, I'm happy this is being looked into.</p> <p>With the 3 options on the table. I prefer enhances bus service with no road widening or snow sheds. We also need year round service and stops for backcountry uses. This makes our canyons more accessible to everyone in the valley and not just those with a car.</p> <p>I do support a canyon toll.</p> <p>I like the mobility hub. But we need to have more mobility hubs. Maybe one from each city that goes directly to a canyon and reduces transfers for rider.</p>	Madelyn Corey	Website
6035	No gondola or new road	Will Saunders	Website
6036	I support the gondola proposal. It seems to be the most effective and safe alternative to car traffic without adding car pollution through buses.	Claire Tempest	Website
6037	NO GONDOLA!	Gabriela Trmal	Website
6038	Please find other alternatives that are not so extremely invasive. Installing a gondola will alter the entire ecosystem. That has exponential consequences that cannot be predicted or fixed. The canyons are not just for making money...some things need to be left alone.	Abby White	Website
6039	I would like to mirror the comments of the SLCA (Salt Lake Climbers Alliance) in support for the enhanced bus service alternative, with no roadway widening. All other alternatives do not take into consideration the multitude of other users within LCC, and serve only to support resort skiers. Furthermore, the gondola would be an inefficient use of resources that could only be taken advantage of during the winter peak usage, along with being an eyesore. Expanded roadway options need to evaluate the impact to climbing access (especially in the winter) along with the potential to disrupt current climbing destinations. Public funds ought to serve the public interest, not just the interests of the resorts.	Rollin Grimmitt	Website
6040	I support the gondola alternative. I believe it will have less environmental impact in the construction and implementation phase. The gondola is a long-term solution, while the other options are helpful for flow/traffic they will only offer short-term support. That said, this entire EIS process is very short-sighted in that it is only doing an analysis for Little Cottonwood Canyon. For this EIS and mountain traffic planning to be successful and worthwhile, the EIS must be expanded to examine alternatives for both Big Cottonwood Canyon and Little Cottonwood Canyon. These canyons are connected in numerous ways and if we want to continue to have these Utah ski areas enjoyed by our local population and travelers far and wide (and reduce traffic and impacts to these 2 canyons)- we need a solid solution for both canyons and to include more of Wasatch drive. These 4 ski areas host national and international travelers (and the local community) and bring in important funds and business opportunities for Utah. If we want to be a world class ski and mountain destination, we should be looking at how Europe manages multiple areas with high densities of people/cars. That type of analysis necessitates having this EIS applied more broadly and include Big Cottonwood and the resorts in that area (Solitude and Brighton). Now is the time do this work... not after LCC work has begun.	Kate Novak	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6041	<p>Pretty much all of what I have been reading about this topic involves only how it affects the winter crowd. This is really small-minded. I know that of all of the use groups that occupy the canyons, resort skiers account for the great majority of the money that comes in. Money doesn't really matter to me, and it should not really be a primary consideration in making these decisions. The primary factors should be preservation of the natural resource that attracts so much attention and maintenance of the user experience.</p> <ul style="list-style-type: none"> - A gondola will inhabit the view of the canyons and permanently alter the aesthetic experience for everyone who goes into the canyon. - Gondolas and buses can both run on clean energy so as not to contribute to the already terrible air quality in the valley. - Widening the road places a clear priority on skiing at the resorts and ignores the value of the rest of the canyon. This will lead inevitably to an increase in attention to the resorts at the top and will result in increased bad traffic. More and larger roads has never been a logical, long term solution to traffic. <p>It may be that in the end a gondola will be needed. But even a fancy new gondola will not solve these problems without a corresponding change in behavior and attitude. This is happening slowly in Utah. To speed it up there needs to be better resources and facilities. Lockers or storage at logical places at the top and bottom of either bus or gondola lines are mandatory. If they are managed by the resorts, they will inevitably become a source of income (through fees or ad placement) for the company and a source of irritation for the users.</p> <p>The bus option without road widening is the only logical option. Widening the road does not work for the following reasons.</p> <ul style="list-style-type: none"> - The time saving is only enough during peak hours and the rest of the time the public transit will be empty. - If there is a car spin off then all bets are off. - As we have seen with the HOV lane, nobody respects the laws that keep people out. Not even the people that made the lanes. The lawmakers felt bad about being left out. So they made it so you can buy in. As long as this attitude persists change will be slow. <p>To conclude: Gondolas are a permanent negative change that is unnecessary and will not be used fully. Widening the road damages the canyon, focuses attention too much in one place and doesn't solve the problem without a corresponding behavior change. Buses and increased public facilities are the best first step and may be all that is needed. Have the resorts charge for parking and watch the traffic drop off. If we switch to a gondola later, the buses can be used somewhere else.</p>	Andrew Jones	Website
6042	<p>I am in support of the Gondola plan that will minimize environmental impacts of cars as well as ease congestion and offer better opportunities for those without cars to access ski areas</p> <p>First, a big THANK YOU for assembling a really well organized and clear site to cover all this information! Well done.</p>	Christian Paget	Website
6043	<p>As a resident of the area for 30+ years, I have many thoughts that I'll just blast through here. Thanks in advance for your objective consideration.</p> <ul style="list-style-type: none"> - What would the operating hours be for the gondola? Would it be subject to road closures the same way vehicle traffic is? The implications are significant here. Moving the 'waiting game' from the Tram plaza to the mouth of the canyon is far from ideal and de-incentivizes using that transit option. It creates a net-zero outcome in terms of the ski experience, possibly even a losing one since the rush of people arriving at the same time gets larger. For this option to be a big win, it needs to enable early access or increase the time window for getting to the resorts. This spreads out the traffic load and reduces the max capacity requirement across a larger time window. - What about trailhead access with the Gondola option and the Tolling/Vehicle Management practices? White Pine is not shown as a gondola stop and is a significant target for many canyon users, including outside the operating hours of the resorts. - How much parking capacity would be at the gondola base? Much of this whole scheme is predicated on improving traffic conditions for the local residents. But, it appears that all options push users into the funnel at the Quarry or Highland hubs. In that case, anyone living in between those hubs and the canyon get penalized and actually have to drive AWAY from the canyon to enter the system. They suffer both timing and logistic complications that undermine the huge reason for living in Cottonwood Heights. This could also be perceived as a negative impact on real estate values (think Inverse Condemnation). The widening of Wasatch already has implications around this (unless the speed is reduced). Locals definitely do not want to be penalized for being... well, locals. - There needs to be more clarity on what 'Tolling & Management of Vehicles' really means. Are we talking about a booth at the mouth? Season driving passes? Daily passes? Local exemptions? - A mid-canyon turn around for traffic management is a bad idea because people are already halfway up the potentially snowy and congested canyon by the time any filtering/enforcement is encountered. - The proposed Gate Buttress parking lot is a great move, except it shows only 21 parking spots, which is a significant reduction to the current capacity. There are frequently more than 21 cars parked there today, plus overflow onto the street. A parking lot there is a great idea but it needs to be refined for more spots than the current diagram shown on the EIS site - The "very expensive" notion of improving the road such that is seldom closed for control work is very appealing in many ways. Keeping the traffic flowing should alleviate most of the problems since traffic will not be at a standstill for hours in the morning. However, I think the practical reality of a bus lane next to a car lane while winding up a snowy/dangerous road would prove to be a messy situation. Excited skiers will not follow the rules and poor drivers will get stuck in it, blocking everyone in the middle of a tunnel/snow shed. Etc. etc... I think the proposal is idealized and the reality would not match the predictions here... People are inherently too chaotic in that canyon for it to work as well as is suggested. - The Gondola map shows a big pole right in the middle of the Gate Boulders. That will be a giant aesthetic foul... Suggest moving that a bit down canyon so it's not right in everyone's face when they begin walking that very heavily used access trail. <p>Again, thanks for your work tackling what is a very tough problem riddled with traps and dissent, especially from the uninformed :)</p> <p>Cheers, Scott Keller</p>	Scott Keller	Website
6044	<p>I am IN FAVOR of the Doppelmayr 3S gondola option for Little Cottonwood Canyon!</p>	Bradley Hardy	Website
6045	<p>First choice is the Gondola. This should be the most effective for reducing car pollution and protecting wildlife. Second choice is year round increased bus service, ideally in addition to a gondola. The Gondola will also allow the road to last longer, and decrease road maintenance. Either way, I think we need a system in place to limit the number of private cars up the canyon. For instance, allowing parking only in parking lots, no roadside parking. I do not support a dedicated bus lane, as this would widen the road and not deter private car usage.</p>	Josh Anderson	Website
6046	<p>As a home owner that is living with the current issues with Wasatch Blvd congestion on ski days, speeding noise and pollution. I could have not said this any better.</p> <p>As for the 2 alternatives for Wasatch, it is our opinion that: Both Wasatch alternatives fail to even meet local and regional plan criteria, and as such they should both be disqualified and a new alternative should be drawn up. Both options go well past the prescribed 5 lane configuration as presented by the Cottonwood Heights Wasatch Master Plan, and even surpass the WFRCC regional plan of 5 lanes for this segment for Wasatch. How is that? UDOT is pushing the envelope when they call their 5 lane alternative by the use of the number 5. In fact there are 7 lanes in the configuration they present and they themselves have stated publicly that they would not be shy to utilize the shoulders as a traffic lane if traffic conditions should make it necessary. By that statement, even the Imbalanced alternative goes beyond the 5 lane maximum prescribed by the regional plan by paving 6 lanes of travel.</p> <p>This is an abusive and hardly needed expansion of a road that will increase capacity to levels in the year 2050 in excess of what is called by even UDOT Standards. It will become a barrier for cross traffic between the east and west communities. It will be so bad, and UDOT knows this, that they will require pedestrian bridges because it will be so dangerous to be found in the presence of this environment without 4000 pounds of steel surrounding your personal space. The amount of pavement will almost double the amount of storm water it will collect in rain and snow events regardless of the alternative chosen, it will increase noise pollution that will not only make it a less desirable place to live, but also affects wildlife along the foothills. The width and speed prescribed on both alternatives will also make it more likely that wildlife will collide with cars along this route at similar levels than seen at the segment of Wasatch near the Gravel Pit. Because ultimately the geometric dimensions will be necessarily even wider than at that location.</p> <p>As for safety, There are 13 intersecting points into Wasatch along the 2.2 miles of urban space. About half of all traffic that uses Wasatch enters or exists through one of these 13 points, of which 7 of them are not signalized. A multi-lane environment at 50 mph will increase the likelihood of side-impact to local users of the road. Impacts so severe that statistical data shows that people will have less than a 15% chance of survival. This is data that UDOT is aware of and continues to ignore through their persistent use of a 50 mph design speed.</p> <p>UDOT needs to stop and just put in 35 mph speed limit as they said they would and leave the road alone!</p>	Leslie Kovach	Website
6047	<p>Hi. After researching the 3 propositions for improvements to LCC access I favor the alternative that includes expanding the Bus service without implementing road widening. Especially if this bus service can be expanded to include bus stops at key points throughout the valley to minimize congestion at the bottom of the canyons. I am concerned that the impact and cost associated with widening the road would be prohibitive, and further believe that before committing to this option the simpler expanded bus service should be explored and learned from. I believe the gondola option is prohibitively expensive, has a prohibitive environmental impact on the canyon, and in the end would be ineffective in alleviating the congestion on the road since realistically people will not use a gondola over a car.</p>	Eric Lindekugel	Website
6048	<p>Thank you</p> <p>I want to vote for alternative number 1. I think we could use more buses but I do not see a benefit in widening the roads because that will only lead to further development in the canyon.</p>	Justin Lambert	Website
6049	<p>As an outdoor enthusiast, I believe the enhanced bus service with no roadway widening is the most attractive alternatives of the three presented. None of the other options presented do much to address the needs of the dispersed recreation users. These options seem to be expensive and will have a high impact on the community and the taxpayers as well as the environmental well being of our National Forest and Wilderness areas. All these options seem to address the needs of the ski resorts and their desires to increase their profit and ease of access while neglecting the many other canyon users as well as the industry that supports. Backcountry skiing is growing faster than resort skiing, and rock climbing and dispersed recreation is a growing and substantial industry in Utah and Salt Lake. Not addressing the future needs of this community in favor of addressing the current needs of the ski resorts is doing the Salt Lake community, and the national and international outdoor industry a great disservice. Access throughout the canyon is imperative to not only the needs of the dispersed recreation users but also spreads out the impact on our lands to a greater area, thus preserving it for future generations. A better and more sustainable solution needs to be found that addresses the needs of all users and the natural environment that will be able to last the test of time. Planning for now and the very near future is a wasteful view that leads to obsolete infrastructure and lasting environmental and financial impact while not solving the problem.</p> <p>No matter what conclusion is reached, there are essential factors to consider.</p> <ol style="list-style-type: none"> 1. There must be increased parking for users to use the increased bus or any other transportation services. Building a large parking structure on an already existing park and ride lot is the most attractive answer. 2. Ski resorts should be paying for some or all of increased transportation. The resorts are generating revenue from people parking on their premises. The ski resorts need to share the responsibility of increases transportation. Increased public transportation up LCC, BCC, or Parley's Canyon should not fall on the shoulders of the taxpayers alone. 3. A more long term solution than a gondola is a train. Particularly an underground train using some of the existing mining tunnels. It would be impervious to avalanches and reduce surface traffic a lot. 	Ashley Brown	Website
6050	<p>Either way thinking about, taking action, and implementing increased public transportation are essential steps to decreasing air pollution and treacherous weekend hours spent idling in the red snake. Thanks for the effort!</p> <p>Please see attached comments on the Little Cottonwood Canyon EIS Alternatives and an attachment SCR10 (2012) as it pertains to cumulative impacts analysis on the state's pursuit of building phase 1 of a ski interconnect.</p> <p>Thank you in advance for your attention.</p> <p>Carl Fisher Executive Director Save Our Canyons</p>	Carl Fisher	Email

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6051	<p>As an avid climber and skier, I encourage the adoption of "Alternative of Enhanced Bus and no additional roadside capacity" with some considerations. I encourage the consideration and review of the Salt Lake Climbers Alliance's position, found here: https://static1.squarespace.com/static/58e52138ff7c50175cc0d2061/5f05079eadf9984d8a54ecd7/1594165152267/20200707__+SLCA%27s+Title+Cottonwood+EIS+Comments+%28Final%29.pdf</p> <p>I recognize the importance of increasing the transportation capacity of Little Cottonwood Canyon, particularly on 20-40 weekend days each winter. I encourage the commission to consider the source of the increased traffic which seems to be nearly entirely skiers and snowboarders accessing the LCC resorts. I would therefore expect the funding to largely come from the private entities which would be the primary economic beneficiaries of any transportation enhancements. Without the resorts in LCC, it's not clear that any major infrastructure work is necessitated. The beneficiaries of any major infrastructure work should cover most the costs associated with enhancing access to their resorts, not the general public. A resort tax could fund the majority of any required funding. Any fees to bus riders would deter usage.</p> <p>I'm also concerned with the visual and environmental impact associated with any gondolas traveling the length of the canyon. Such proposals do not address the needs of dispersed recreators, only the big resorts, and therefore meet the needs of only some of the canyon user groups.</p> <p>Thank you.</p>	Jason Hall	Website
6052	<p>Thank you for the opportunity to comment. Here are my comments</p> <ol style="list-style-type: none"> 1. Enhance bus service. This past ski year the bus service was much improved. I took the bus several times. As a part time employee of Brighton I have always attempted to carpool. I think that with enhanced bus service people would be more apt to take bus up Little Cottonwood canyon. 2. Widen road for a bus lane with strict fines for violators. We could use the bus lane for biking in summer months. 3. Encourage ski resorts to charge for parking. There could be discounts for car pooling. 4. Toll for Little and big Cottonwood canyon it would help to provide buses year round and provide maintenance to trail heads. Works well up Millcreek. We have to pay play and sometimes it takes a monetary incentive for people to do the correct thing. 4. No GONDOLA it will only serve ski resorts. What about all the snow shoeing folks for cross country skiers use the money for more buses of all size. Use the money for summer buses. No gondola. 5. Have ski resorts parking money pay for more buses 6. Have a ride share lane people pick up people at bus stop and get a pass to go in the bus lane. <p>Thanks Arleen Barrell</p>	Arleen Barrell	Website
6053	<p>I wrote most of the Wasatch Backcountry Alliance comment so i will post that below. But i have a few more comments beyond that from my personal perspective:</p> <ol style="list-style-type: none"> 1. I have been very disappointed that udot chose to exit the broader process; you missed The Opportunity to work closely with all stakeholders on a more comprehensive plan for the whole area. So it's hard for me to think that you have a broader picture in mind. <p>The fact that UDOT doesn't seem to have any interim solutions, ignores bcc and wasatch back issues as well, rejected other potential transit options such as rail, didn't work with any other stakeholders to identify potential a mobility hub closer to the mouth of LCC, and didn't work with UTA to clarify if they can even accommodate your ideas is indicative of the fact that UDOT is an unwilling partner when partnering is sorely needed. I am particularly annoyed that you aren't addressing summer use of your options, and no mention of tolling despite getting a mandate from the state to do so, which would provide funding as well as disincentivizing vehicles.</p> <p>In short, I think UDOT clearly did a lot of work to get to this point, but there are huge holes and problems with the plan (and why is the comment box so small!)</p> <p>The wasatch Backcountry Alliance comments (again, that I mostly wrote) are pasted below</p> <p>In our comment regarding the original EIS Scope and Need process in May 2018, Wasatch Backcountry Alliance's comment began with this statement: "Wasatch Backcountry Alliance (WBA) envisions a low cost, low emission, energy efficient year-round multi-modal transportation scenario for improving the current traffic situation in Little Cottonwood Canyon (LCC). The system we envision must be capable of providing efficient and predictable service for travel to both developed locations (ski resorts) and to trailheads and other stopping points for dispersed use in LCC. Any improvements being made in LCC should be tied in to a larger transportation system that serves and benefits the entire Central Wasatch." To that end, with regard to the current LCC EIS, WBA supports enhanced busing with no widening of Highway 210.</p> <p>WBA firmly believes that before any transportation system is selected, there must be a thorough analysis of the carrying capacity of Little Cottonwood Canyon. This will help establish the volume of people that need to be moved up and down the canyon, which will invariably help determine which transportation system best fits that purpose and need. WBA strongly encourages UDOT to work with other stakeholders, including the US Forest Service and Salt Lake County, to undertake a carrying capacity analysis and to make that part of the current EIS.</p> <p>With regards to the two options that use more buses (extended bus service and widening of the LCC road to accommodate yet-more buses), WBA continues to support the same concept that we stated in our May 2018 Scope and Need comment: "The transportation system should use the best currently available technology to serve all user groups on a year-round basis. WBA believes that the best currently available technology that meets our criteria is a flexible and dynamic fleet of energy efficient buses and vans using a series of transportation hubs." At this point in time, we do not think that Highway 210 should be widened to accommodate more vehicles, but that having dedicated times for buses and cars with 4 people (ie. 7-9am and 3-5pm) should be more thoroughly explored.</p> <p>The most-recent EIS document clearly reflects a lot of work done on the part of UDOT, but it also generates many questions and we feel there are some important fundamental flaws that should be addressed. To that point, we have some comments about what we regard as key issues with this EIS:</p> <p>The current EIS does not address the concept of multiple Mobility Hubs other than the one on 9400 South and the one at the Gravel Pit. WBA thinks that the transit system needs to originate at locations around the valley (ie. U of U/Foothill, downtown, airport, WVC, Draper, West Jordan and points farther south, etc.) so that people can access the bus where they live, rather than drive their car to a mobility hub to catch the bus. When faced with this choice, we suspect many people will choose to remain in their cars rather than use the bus. There is very little discussion of the needs of non-ski resort, dispersed users (in particular with regards to the White Pine trailhead, which has already increased in use to the point where it's dangerous due to on-highway parking in both summer and winter). We do not see any financial life cycle analysis (capital and operation, maintenance) of any of the options presented over the projected timeframe. Given that the least-expensive option will come at a cost of ~\$100 for every single Utahn, this is relevant). There is no mention of any interim solutions, and according to a UDOT spokesperson, UDOT has "no idea" what to do in the interim, nor are there any approximate timelines to actually identify what the "interim" is. LCC is facing an acute problem now that will only worsen, and the lack of timeliness is a major missing component of the EIS.</p> <p>There is only token consideration given to the effects of each of the options on the vital LCC watershed, either by construction or ongoing use.</p> <p>There is very little/no mention of tolling on vehicles, though it is our understanding that the Utah state legislature specifically allocated considerable monies to UDOT to consider tolling, and as noted above, the Wasatch Backcountry Alliance is a proponent of tolling.</p> <p>The EIS provides no rationale for UDOT's winnowing of 35 different options to these three.</p> <p>Based on our review of the EIS, the focus of the document and the tone of the online meetings on June 23-24, despite there being three alternatives in the EIS, it seems that the gondola option is being pushed as the preferred option. While we recognize that there may be potential benefits of a gondola operation, there are important components of it that we take issue with:</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Tom Diegel	Website
6054	<p>I see no reason to tear up LCC to accommodate 2 ski resorts and their patrons; therefore the only option I would support is the one for increasing the number of buses without widening the road. I would only support this option if (i) the buses stop on their way up and down the canyon in the winter at the White Pine trailhead so that backcountry users may also use the bus (after all, I assume that the general public including backcountry users of LCC will be funding the project), (ii) the buses are run up and down LCC year round so that hikers can use the buses in the summer (again, I assume that the general public, including hikers, will be funding the project), and (iii) not only winter buses, but also summer buses, stop at the White Pine trailhead.</p>	Susan Allen	Website
6055	<p>I am in favor of increasing the bus fleet and charging private vehicles an entrance fee.</p>	Kevin Box	Website
6056	<p>Look at Zermatt Switzerland. Replace the road with a train and make the canyon car free. Parking structure at the base train up with a couple whistle stops on the way the quality of the Wilderness would improve as you wouldn't be salting the road the train would be electric reducing point source emissions in the canyon from cars and the space used for parking at the top could be used for other more productive things.</p>	Jared Current	Website
6057	<p>All of these options are far too destructive, and far too beneficial to business looking to profit off the area.</p>	James Sprankle	Website
6058	<p>I just submitted my comment but want to send an addendum with 2 points: the ski resorts will be huge beneficiaries of any transit system, and I would like to see them kick in some for it.</p>	Tom Diegel	Website
6059	<p>And along those lines, while the concept of "enhanced tourism" was not specifically mentioned in the eis, it was brought up several times by UDOT representatives, and this had never been mentioned before as part of the purpose and need. If it continues to be used as such that is an abrogation of your responsibility to the EIS process.</p> <p>I support the enhanced bus alternative because it appears to have the least amount of impact on canyon foot print and is the most realistic in actually making a difference on canyon congestion.</p>	Tyler St. Clair	Website
6060	<p>As much as I would love to support a Gondola, (the kid in me would love it!), I can't for the sake of the environment, natural beauty, practicality and cost support it. The novelty of a gondola, the use of it as a marketing tool is tempting but I personally don't see any benefit aside from it's 'coolness'. We will still have the LONG travel time to get up the mountain, still have lines when going up the canyon and especially when going down (with everyone wanting to leave at the same time). I can see people riding it 'once'.</p> <p>The enhanced bus service with roadway widening appears to only save 18 minutes for arrival time yet costs almost \$200 million more...not, in my opinion a good value ratio. It is also taking away twice as many outdoor adventure (hiking) sites & facilities. Sadly the only option of the three offered that I would be compelled to select is the highly cost effective enhanced bus service without the road widening. I wish there was another alternative that could really solve this problem but construction of a 'gondola' or tearing apart the beauty of the canyon to widen roads is not that alternative.</p> <p>The best option is to enhance the bus service without widening the roads.</p> <p>thank you.... Thank you, E. Brown</p>	E. Brown	Website
6061	<p>I support increasing bus services in LCC, with transit hubs at the base of the canyon. I also support the use of tolls to reduce the incentive to drive and improved parking by trailheads.</p> <p>Expanding the road would negatively impact dispersed users. Hikers, snowshoes, and other dispersed users would lose parking. Climbers would lose access to bouldering.</p> <p>The gondola only serves the resorts and would still have a massive parking problem. Proponents of the gondola argue that it will pay for itself. I believe that if the cost of the gondola were too high, most people would still opt to drive, and this would not solve the problem.</p> <p>Expanding bus service with improved parking and transit hubs is in my opinion the solution that serves all users the best. The discussion should not be all about what is best for ski resorts and resort skiers. We need to include all users. Expanding bus service while NOT expanding the road and NOT building a gondola is the only solution that serves all users.</p>	Ben LaRiviere	Website

6062	<p>Hello my name is Christopher Powers. I am an architect in New York but grew up Sandy UT. My thesis project in college (2012) was regarding this very issue and focussed on transportation, watershed pollution and education. My project, titled "Cottonwood Canyon Conservation Center", entailed a transportation hub at the base of Little Cottonwood Canyon that served as a link between "valley public transportation" and "mountain public transportation". The structure double as a "conservation museum" and took advantage of the change in transportation to educate people on the invaluable importance of our mountains and canyons.</p> <p>In the end I found that increased bus service with increased amenities at drop off points was the best solution but the project I studied served as an important exercise as well as allowing me to create a piece of architecture.</p> <p>I have include a link below to download a visual sheet of my project. This area is the most important place in the world to me and would love the opportunity to be help and be involve in any way possible.</p> <p>https://www.dropbox.com/sh/s9ryyiemostxt6h/AAC7ecJxV4S4VDTq0EnnBcrnVa?dl=0</p>	Christopher Powers	Website
6063	<p>Hello UDOT Planners,</p> <p>Thanks for the opportunity to provide input to the UDOT Little Cottonwood Canyon draft EIS alternatives.</p> <p>Based on available information at this time I can only support the option for: Alternative of Enhanced Bus and no additional roadside capacity</p> <p>The canyon's serve a wide variety of user groups throughout the year (not just winter) and any solution needs to consider year round impacts and users beyond simply the Snowbird / Alta ski resorts at the top of the canyon. Impacts and accommodating the needs of these dispersed user groups is not clearly addressed in the proposed options and leaves much room for concern. Details matter here. I'd like to get clearer specifics of the impacts outlined below.</p> <p>Analysis of current and future dispersed recreation usage, transportation and parking needs in the whole of the canyon during all times of the year, spring, summer, fall, and winter. Dispersed recreation areas including, but not limited to the lower LCC Park & Ride, Grit Mill, Gate Butness, Coalpit, Y-Couloirs, Tanners,White Pine, Mt. Superior, and Helgate.</p> <p>Inclusive Transportation that Serves Dispersed Users - this includes ensuring parking at key trail heads and/or by ensuring bus service is available to these stops. How will this be addressed?</p> <p>Impacts to Roadside Climbing and Climbing Access - What areas specifically be impacted and what will mitigation options be to actually climbing areas and parking areas?</p> <p>Clarification of "reduction to roadside parking next to resorts" - especially as it relates to parking in the town of Alta near the Grizzly Gulch Trail Head and next to the Alta Lodge, Snowpine / Rustler Lodge, Alta Peruvian Lodge, etc</p> <p>Best, Ryan Collins</p>	Ryan Collins	Website
6064	No construction that would ruin hiking/ biking trails	Becky ross	Website
6065	<p>As an avid skier and Salt Lake City resident I would love to see a public transit option rather than expanding the lanes or more development. We should be able to enjoy the outdoors and protect it at the same time.</p> <p>I am in favor of the Enhanced Bus with Road Widening option for a number of reasons. Honestly, I would have been a bigger fan of simply adding a middle bus-only lane that serves uphill buses in the morning and downhill buses in the afternoon. It would avoid a full blown four lane road over the length of the canyon and would best utilize the space that's already been widened to three lanes for turning and passing lanes, minimizing road widening requirements. Since this is not an option, I support the four lane widening. My primary reasons for this choice are: 1) It leverages people's desire to minimize commute time instead of the supposed desire to reduce environmental impact and to be stewards to the planet, specifically the watershed. 2) It is the only option enhancing public health and safety year round, by giving the necessary space to safely travel the canyon by bike or on foot during the summer.</p>	Annie Francl	Website
6066	<p>First, excess traffic in the canyon during peak ski season demonstrates that people are simply not driven to use public transportation to decrease their environmental impact, the primary purpose of an "environmental impact study" as this one is called. If people cared about their environmental impact, they would already attempt to use buses closest to their home to commute to the canyon, and we wouldn't have this problem in the first place. Instead, people come to Utah to experience the greatest snow on earth, and the best experience comes to those who arrive first. A toll doesn't deter people either, as a cost increase of a commute does not have a significant impact over whether people drive. This was demonstrated by Solitude's paid, yet consistently full parking lot during peak season. People's primary reason for choosing private cars over public transportation is because it gets them there the fastest, and is the most comfortable. No looking for parking, no waiting for a bus, all from the comfort of their own cars. The other two options simply don't address this issue. It's safe to assume that public transportation is not going to be much more comfortable than it currently is with any option, so we can't fix that. What we can do is make public transportation more efficient than driving. By minimizing the time people spend on a bus they don't really want to be on, we also encourage them to use it since it will take about half the time sitting in gridlock canyon traffic would. If our effort really is to have the minimum impact on the canyon, we should implement a solution that encourages people to actually use it.</p> <p>The widened road also has public health and safety in mind, while specifically serving those paying for the project. Cyclists and pedestrians using a small shoulder on a winding mountain road are a hazard to cars, and vice versa. The safety hazard of using the canyon roads by any mode besides a car turns many people away limiting our use of this unique resource to promote public health. The public need to get to the outdoors has been highlighted in recent months as more people head to the outdoors as indoor recreation has been stunted. As a frequent user of LCCs trail system, I have seen a huge increase in the number of individuals making an effort to get outside and stay healthy. What I have not seen is a significant number of people cycling or walking along the roadways. While there may be other factors, I believe a primary deterrent is, in simple terms, that cars are big, fast, and heavy, and they seriously injure or kill people in a collision. The risk is not worth the reward. A wider, safer lane mitigates this issue by giving ample space to safely commute in the canyon by bike or on foot. No other option attempts to use tax dollars provided by Salt Lake residents to specifically serve Salt Lake residents, while a widened roadway allows them to safely use an available public resource for outdoor recreation that is currently too unsafe for many to appreciate.</p> <p>As such, I support enhanced buses with a widened roadway as it most effectively addresses the problem we are trying to solve while keeping SLC residents healthier, happier, and safer than any other option could try.</p> <p>Thank you for taking the time to read all of these comments. I know it's an onerous task, and I'd like to be more involved with it in the future. I sincerely appreciate it.</p> <p>The solution to the traffic problems in Little Cottonwood Canyon is more people in fewer vehicles. This includes more people using the bus system and incentivizing high occupancy in private vehicles.</p>	Daniel Nix	Website
6067	<p>Bus service need to be frequent, reliable and inexpensive.</p> <p>Reliable service includes service that can bypass the worst of the traffic jams on Wasatch and North Little Cottonwood Road and get to the head of the line at the mouth of Little Cottonwood Canyon. I fully support the fact that all three option include improving these to segments of the road to the resorts. This is critical to getting people into busses.</p> <p>The occupancy of cars can be increased by putting a toll on those who drive up the canyon. This also makes the bus look more attractive.</p> <p>Occupancy of cars will also increase if cars that are not carpools must pay to park. The pay-to- park scheme adopted by Solitude resort last year should in some form be adopted by Alta and Snowbird.</p> <p>Only after these steps have been taken and have been found to be wanting should UDOT consider an enhanced bus lane in the Canyon or an aerial tramway</p>	Joan Powers	Website
6068	Now is the time to act in a responsible matter that addresses the well-being of LCC and the concerns of stakeholders. Therefore, I would like to send my comments of support for the alternative La Caille-based gondola option. I feel as though it best addresses the long-term and short-term concerns of this precious resource. Thank you!	Jessica Chindgren	Website
6069	i am not in favor of the gondola. too much hardware on the hill and doesn't do enough. i wish we didn't have to, but the traffic problem is not going to go away, so i am in favor of the wider bus lanes. we need folks on buses. it is fast, and a reasonable travel alternative and in the summer, lets let the bikers use it.	dan senior barrell	Website
6070	<p>I do not support putting a gondola in either Cottonwood canyon. The Cottonwoods are not just for skiing and a gondola only benefits people going to the ski resorts. A gondola is a gateway to more development in our beautiful canyons. I'm worried about the negative environmental impact it would have on the canyon and our watershed because of the construction building a gondola requires. Plus, I don't want to see a massive gondola system in the canyon when I'm hiking there in the summer.</p> <p>An extra lane for just buses that turns into a bike lane in the summer in the best idea of the three. Enhancing bus service, but not having a bus lane is pointless. That doesn't give any incentive to take the bus instead of a car because you end up in the same traffic either way. Currently 60 people packed into a ski bus get the same priority as one person in a car. I took the bus a few times last year and will never forget one of the miserable rides I took up the canyon. The bus was stuck in traffic and I was standing in my ski boots, in a crowded bus, holding my skis, & getting car sick because of the winding canyon road. I'm a lot shorter than everyone else so to pack everyone in that tight made it hard to breathe. If I had just car pooled instead of taking the bus, I would have had a comfortable ride up the canyon. Either way I would have been in the same traffic.</p> <p>The real solution is a train. Or a Trax line going up and down the canyons that shares the road with cars. To stop cars from heading up the canyon, the only way up during peak hours (7 AM-10AM) Friday-Sunday in the winter would be the train. The only way down during peak hours (3PM-6PM) Friday-Sunday would be the train. Cars could still drive the road any other time of the day. This could also be implemented with buses. Only buses allowed up the canyon during peak hours. The buses could make short stops at a few different places in the canyon on the way up and down to satisfy backcountry skiers too.</p>	Eden Sloan	Website
6071	I support the snow sheds and lane alternatives. No to the gondola. Tolls should also be implemented for all users wanting to take a personal vehicle up the canyon. The goal should not be to maximize traffic up the canyons, it should be to create a model for sustainable canyon use. Currently, most canyon users contribute NOTHING to public land management in the canyons. As usage increases, management and maintenance needs increase. Ski resorts get sweetheart deals from the forest service to lease public land for their operations, the least people can do is pay to manage and minimize the impact of their use.	Andrew Wike	Website
6072	I believe that there are more efficient alternatives for transportation than biking a gondola. I say no to a gondola!	Nichole Peterson	Website
6073	I think the gondola system would be the best option not only for the environmental impact is less than busses but you can also expand the parking garage for the gondola at the base much easier. I grew up riding the buses and they are a terrible experience, crammed, hot and smelly, and not much room for all your gear. Where as the gondola it would be just like riding at a resort and it's a more pleasant experience and everyone will have a seat and won't have to stand. I haven't rode the buses since I was able to drive, about 15 years ago. Even since then they have added buses and it still doesn't seem to turn more people to buses.	Greg Snyder	Website
6074	The gondola will have a huge negative environmental impact and not help the congestion issues. There are only a few select days where traffic is a major problem in the winter and the gondola proposal does not make sense. Please work towards encouraging more busing to eliminate the traffic.	Andrea Krong	Website
6075	I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on diverse recreation in the canyon.	Antone Frandsen	Website
6076	The third option sounds like the best option to me.	Lamont Harris	Website
6077	With the increasing popularity of Little Cottonwood, coupled with the projected growth of Salt Lake's population, now is the time to act and act in a responsible manner that best addresses the concerns of the majority of stakeholders and the issues facing the well-being of LCC, not the least of which is the sheer amount of automobile traffic and its environmental impact. Therefore, I fully support the La Caille-based gondola option as I feel it best addresses the concerns, both short- and long-term, of this precious resource.	Victoria Loveless	Website
6078	I would support the additional bus service with no additional roadside capacity to protect the roadside climbing areas and parking needs along the road in Little Cottonwood Canyon.	Stephen Snell	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6079	I support additional buses and transportation hub the excludes the need for snow sheds or an inefficient gondola.	Mark Lehmkuhle	Website
6080	I stand with the side of bus system expansion. While the population continues to grow in the valley, I feel as though a gondola/roadway expansion may be over-the-top "solutions" financially, and from practicality standpoints. While I understand the inescapable need for expansion, one of the biggest characteristics of LCC's resorts is their incomparable personalities and their unique charm. Building a gondola would continue to transform these resorts into commercialized tourist attractions, and while, yes - this is the goal of capitalism (growth), this would further diminish that charm found in the canyon, hindering Alta's Magic and the Word that is Bird. Begin this environmental approach with a bus system expansion to save money and to help maintain what makes LCC special. This statement is not purposed to stereotype or exclude any party of human beings; however, expansion in the form of a gondola will draw a crowd that will not benefit our LCC = IKON x 10. To whom it may concern:	Anonymous Anonymous	Website
6081	Of all proposed plans to improve transportation in little cottonwood canyon, I believe strongly that an enhanced bus system without an accompanying road expansion is the best option. The primary reason for my stance is that this option will have the least environmental impact on recreational activities in the canyon, namely rock climbing. Little Cottonwood canyon is home to world class climbing in many forms, which draw people from all around the world. Many of these attractions are located nearby to the road itself. If an expansion of the road were to occur, I fear that we would lose many of these climbing destinations which the community holds very dear. I hold a similar fear in regards to the installation of a gondola. Improving transportation in LCC is of critical importance, but it should not come at the lose of so many other important attractions. thank you so much for your time and consideration.	Jesse Williams	Website
6082	With the increasing popularity of Little Cottonwood, coupled with the projected growth of Salt Lake's population, now is the time to act and act in a responsible manner that best addresses the concerns of the majority of stakeholders and the issues facing the well-being of LCC, not the least of which is the sheer amount of automobile traffic and its environmental impact. Therefore, I fully support the La Caille-based gondola option as I feel it best addresses the concerns, both short- and long-term, of this precious resource.	Marcie Falkner	Website
6083	I am an active user of the canyons year round, and not of the resorts. I support an enhanced bus option that caters to all canyon users year round and not just the ones that drive business for a few companies. I would gladly pay a reasonable annual fee to have better public transit options that allow me to access all recreation opportunities that the canyons offer.	Daniel Boettger	Website
	Thank you July 10, 2020 Comments on Little Cottonwood Canyon (LCC) Environmental Impact Statement (EIS) SR 210 – Wasatch Boulevard to Alta Alternatives Report, June 8, 2020 Utah Department of Transportation (UDOT) By Matt Sibul: resident, engineer, and canyon enthusiast Big Picture, High Level Comments 1. From a process perspective, UDOT has done a great job to get public feedback on the alternatives that will eventually go into the Draft EIS, due out next Spring (2021). 2. UDOT should not have eliminated the cog rail train from the alternatives report as a part of their EIS Alternatives Report. It was a fundamentally flawed analysis and needs to be re-visited. 3. The train is best overall long term, year-round and cost-effective solution. 4. The report is biased and does not have the Cog Railway on a level playing field with the other alternatives. 5. UDOT and their consultants chose one of the most expensive rail design options while grossly exaggerating the capital cost estimates and compared it to the simplest configuration and cheapest gondola solution. 6. It is not too late for UDOT to revise the alternatives that will go into the Draft EIS. 7. The lack of a level playing field in which the alternatives have been developed and analyzed to date would undermine the "tried and true" NEPA process and could be grounds for an environmental challenge. 8. It is bad public policy and completely absurd for the alternatives to be evaluated and presumed to only be operating during winter months. Any of the alternatives involve a large level of cost, and they should be utilized year-round. 9. The gondola is primarily a ski resort chair lift. There would be no ability for passengers to access hiking trailheads or backcountry ski entry points. Yes the ski industry is important to the economy of Utah, but this seems like an over-reaching public subsidy to private industry. 10. Not only should the Alternatives section of the EIS be re-evaluated, but the project's purpose and need is inadequate. Why would there not be a component of regional connectivity to the rest of the transit system? A gondola is a completely new and awkward form of transportation that has no nexus to the existing rail system along the Wasatch Front. A lot of thoughtful and strategic work has happened over the past 20 years by UTA and UDOT; this LCC EIS completely throws this out the window. Specific Technical Comments 1. A life cycle cost analysis is the best tool to compare a diverse set of modes and should have been prepared. 2. The alternatives are not equally addressed and evaluated. The report is clearly biased towards making some alternatives look better than others. In order for alternatives to be fairly compared, they need to have a similar basis. You cannot compare a rail line from 9400 S. and 2000 E (with urban traffic and residential/business issues) with a gondola at the base of Little Cottonwood Canyon fed by buses from 7200 S. and Wasatch Boulevard. 3. A 9-mile Cog Railway is being completely rebuilt in Pike's Peak, Colorado for a total cost of \$110 million or \$12 million per mile. This report uses \$138-\$169 million per mile. 4. A train can be built with minimal construction impacts as seen by the real-world experience in constructing the Pike's Peak Railway. 5. A train is the most environmentally friendly for air quality, watershed quality, energy consumption, congestion relief, economic development, land use management, pedestrian compatibility, and visual aesthetics, and is the most consistent with the Canyon's core values. The impacts to our wilderness areas and boundaries are unclear. FULL COMMENT AVAILABLE ON PAGE XXX

6085	FULL COMMENT AVAILABLE ON PAGE XXX It appears the best option is the gondola.	Jason Christensen	Website
6086	Greetings- I'd would like to share my support for building a gondola in Little Cottonwood Canyon. I feel that this would best address the goals of the project outlined by the stakeholders involved- improve reliability, mobility and safety while meeting the needs of community and preserving the value of the Wasatch Mountains. A gondola would transport enough people safely while also reducing CO2 emissions in the canyon, which is also an important initiative in Utah with the air quality issues. The Operating and Management costs would also be significantly lower than the other two options. I also think that it's important to preserve the personal property rights as much as possible and this option would only impact 9 properties (vs. 18 with widening the rd and 9 with the enhanced bus service). Additionally a gondola would be easier to shut down and re-open if interlodge was put in place. It would offer an alternative option for skiers and guests to exit the canyon when there are accidents and road closures. Expanding the road would result in more construction and run-off (oil, etc), possibly compromising the fragile watershed and I do not support widening the road or more bus service. I also do not recommend expanded bus service because it would cost the consumer more money to get up the canyon (with daily bus rates). Skiing is already a very expensive sport and it's important to make it more affordable when possible to create more diversity in the sport. The gondola is an absolute win for all stakeholders and would be the best option for the community. Thank you, Audrey	Audrey Powell	Website
6087	The solution to LCC's transportation fiasco must be based on decreasing emissions and lessening the environmental impact commuters have on the canyon/great sic valley. The gondola is a good alternative, although having to take a bus to the gondola will deter people from it. The solution must be easy for people to transition to, as people don't want to take multiple modes of transport with all their gear. Widening the road would only cause more disasters as people would assume the road is faster is larger (spoiler: its not lol). Creating a large parking lot with enhanced bus service is a good idea, but unless there are tangible rewards (incentives) the public will not be drawn towards it. People are motivated by real time reward, and while one can state that these changes are environmentally friendly, the transportation changes have to be easy to transition to and encouraging to the public. Whatever the solution, the more cars we keep out of LCC the better life will be :-)	Rachel Morse	Website
6088	With the increasing popularity of Little Cottonwood, coupled with the projected growth of Salt Lake's population, now is the time to act and act in a responsible manner that best addresses the concerns of the majority of stakeholders and the issues facing the well-being of LCC, not the least of which is the sheer amount of automobile traffic and its environmental impact. Therefore, I fully support the La Caille-based gondola option as I feel it best addresses the concerns, both short- and log-term, of this precious resource.	Chelsea Khan	Website
6089	If you do the gondola plan I will make a trip out just to ride it.	David Sjoberg	Website
6090	Please find attached a copy of a memo created for Chris McCandless of CW Management. He has asked that this memo be submitted on his behalf for his proposed project at the mouth of Little Cottonwood Canyon with a proposed gondola end station site, which is in accordance with the EIS study under review. It is CW Management's hope that consideration of this project, in the context of the overall LCC EIS process, might help with the alternatives solution and the ultimate selection of a preferred alternative. Let us know if you have any follow up questions in relation to this open comment period for the EIS. Thanks, Ryan	Ryan Hales	Email

6091	After much research it seems as though it will be necessary to do both widen the road and add the gondola. Although there needs to be parking for the gondola at the bottom of LCC. More importantly there should be a check point station at the bottom of little and big cottonwood canyons charging people to enter the canyon as mill creek does to help regulate and fund keeping the canyons clean and green. This check point station will also give UDOT more control of vehicles entering the canyon to ensure they have snow tires, 4x4 or chains. Another idea would be to let people carpooling enter the canyon for free like Jackson.	Eric Fabbri	Website
6092	I support the basic increased bus service with no enhanced road widening in LCC. I am against the gondola option for it's impact on the land, plus it's just cumbersome. To drive. Park at the mobility hub. Take a bus. Wait. Hop on the gondola. Then do it all again in the evening. Not gonna happen. This doesn't make it easier nor does it expedite people getting to the resorts. People don't want to take buses in general because they're not convenient and this won't provide enough incentive for enough people to use to make it worth it. I am against road widening due to it's impact on the land and costs. I like that it is the only option that decreased the time it takes, however that amount of altering the land for a dozen plus powder days ruins too much for other user groups. I am a fan of back country skiing in the cottonwoods and these plans drastically favor the resorts. Are they going to share in the cost or is it just the tax payers? The nice part about the basic increase in bus service, is that if it's not working or we need to make adjustments, it's far easier to do in the future. During one of the meetings, it was mentioned having some type of sliding scale pay fee depending on expected traffic that day. I think this could help but needs to be weighted with if people are going to the resorts or elsewhere. Plus how many people are in the vehicle. This could help incentive people toward the bus. During the winter, will these buses be running at this capacity every day or will it be Thursday-Sunday, just weekends etc? I/we agree with Carl Fisher's Comments in the Save Our Canyons recent letter. This traffic problem should be a UTA issue providing transportation up the canyon. NOT a UDOT issue to be resolved with the widening of Wasatch Blvd. We are in favor of Wasatch Blvd remaining a "Neighborhood Street" with 35 MPH. Absolutely no widening of Wasatch Blvd to 5 lanes and 50 + MPH. We are also opposed to the tram/gondola system and the proposed parking structure at the "LaCaille Base" for the tram. It would be unsightly and distracting to the residents and tourists and anyone entering the canyon. Construction of the tram up the canyon would be an absolute nightmare, and how many years would the canyon be closed to allow for construction and improvements to be completed??? The UTA solution should be put into place first, and charge a Toll to drive up the canyon, long before any road widening occurs. If a parking structure is necessary, it should be located at the gravel pit near Big Cottonwood Canyon to allow for easy access to UTA buses. In addition, the amount of construction related traffic up and down the canyon, back and forth along Wasatch Blvd. would be disastrous for the community and the residents, as well as regular commuters. The cost to taxpayers would be overwhelming and we are absolutely opposed as we have stated.	Jeff kenney	Website

6094	1- how many days are we really looking at that are traffic problems ? Dec - April ski season = 22 weekends = 44 days, plus add 10 more holiday days = 54 days of problems and those are not all powder-packed ski days. All of this for 54 of 365 days ? I would like to see more data on trips / how many days are really bad / etc. 2 - what is the max amount of people in the canyon? Is this based on parking capacity? Hotel capacity? ski-lift capacity? Looks like all of the evaluations are based on current people up at resorts. Will any of these options induce the demand ? Will it make the ski areas more populated ? 3 - with any/all of the options, what parking exactly is being removed? roadside, Alta-Wildcat lot, Alta-Albion lot, Summer Road lots, Bird lots? how much of that land can be restored back, or used as transfer stations, etc ? 4 - I think the hub at gravel pit is unrealistic for people from the south, especially those coming up Wasatch Blvd - it is assumed they will all continue past LCC and continue north to gravel pit, park, hop on a bus to then come south ? Especially under bus alternatives - those people are then creating more capacity for those who will stay in cars. Would like to know the penalty/toll for those who stay in cars - it needs to be sufficient enough to make bus attractive. 5 - gondola - I like the idea, except having to go all the way to gravel pit or Highland to then come back to Gondola (I live between LCC and BCC). I think having motorists to hop on a bus, then transfer to gondola, is too much, undesirable. I think the parking needs to be at gondola, or various locations south / east / north of gondola with shuttles, not some huge garage hub. 6 - what about the residents that live between LCC and BCC - they have to go farther away from LCC to then reverse track (I live along Kings Hill, close to the ski resorts on purpose) - will there be a shuttle system along Danish, Kings Hill, Top of the World, etc that can then take skiers directly to Gondola or LCC base to hop on a ski bus rather than go all the way to gravel pit or Highland hub ? 7 - Wasatch - I'm not sure if i fully understand what is driving the additional general purpose lanes. There is 1 lane from the south either Wasatch or from 9000 South - adding a lane on Wasatch from the Hi-T LaCaille turnoff to bottom of BCC accomplishes what - a few less seconds of travel time? Similarly, SB traffic goes from 2 lanes from BCC base up the hill merging to 1 lane - keep it that way, otherwise you will have that same chokepoint down south. I like the idea of keeping the single NB and SB lane with the wide shoulders for bus traffic in the winter. Thank you	Kevin Farley	Website
6095	Alternative parking and transportation is the best answer for existing parking and traffic issues.	Lori Gull	Website
6096	DO NOT widen Wasatch Blvd !!!!! It will not relieve traffic up Little Cottonwood Canyon; it will increase pollution; it will change Cottonwood Heights community; and it is exceptionally expensive. It will only benefit the construction companies. Tax payers are watching your choices in this regard. NO to more pavement. Other choices are preferable.	FK Forney	Website
6097	Hi I would like to see a sound study done of Wasatch Boulevard because as it is now it is really noisy. I would also like to see more calming effects of the road so it can better meet it's design speed.	Jennifer Murphy	Website
6098	I strongly urge the adoption of the option of Enhanced Bus with roadway widening. I realize this is the most expensive of the three alternatives but I believe it is an investment that can last generations without changing view sheds (gondola) and by increasing capacity year round. The summer needs will be addressed as well as the winter needs. A similar plan is desperately needed in Big Cottonwood canyon as well.	Nancy Baker	Website
6099	I have been traveling Little Cottonwood for 37 years, mostly in the winter, skiing at Alta. My biggest concern is that no matter what choice is made for traffic control, the people who still want to drive are going to do so. Therefore I am suggesting a booth at the bottom of the canyon with someone stationed, especially on weekends and powder days, who will be notified by the parking attendants from Alta and Snowbird when the lots are full. Parking on the canyon roads at the resorts has become a hazard as well and should be unavailable with no parking signs. At that point people will need to go back and use the buses or gondolas. This might entice people to use the other transportation choices before trying to drive up. "Widening the road and adding more buses". With this in mind, buses with Alta destination only and Snowbird destination only would help the congestion and time. The "Gondola" might have the least environmental impact and have a uniqueness about it. Thank you listening to the people and your care in this matter. Sincerely, Melinda	Melinda Almquist	Website

6100	<p>The following is the response to the UDOT Little Cottonwood Canyon EIS Draft Transportation Alternatives. The response is from 27 members of the Little Cottonwood Canyon community, which is the area east of Wasatch Blvd between SR-210 and SR-209.</p> <p>Little Cottonwood Canyon Community Response to the UDOT Little Cottonwood Canyon EIS</p> <p>After evaluating the three alternatives presented by UDOT for comment in the Little Cottonwood EIS, we believe option 1 is the best alternative because it makes the least impact on the canyon with an average, but reasonable transit time. Although the transit time for Alternative 2- Enhanced Bus with road widening would reduce travel time for both bus and car passengers, the impact to the canyon by widening the road should not be justified for this reduction.</p> <p>UDOT Alternative 1 and Alternative 2</p> <p>These two alternatives provide advantages over alternative 3:</p> <p>They are scalable solutions where service can be increased or decreased depending on demand. Also, Alternative 1 is scalable to Alternative 2 if we later find it is insufficient. (Note that under either alternative, the snow sheds should be built to handle road widening in case that becomes necessary.)</p> <p>They provide the possibility to serve other canyon destinations in the summer, not just Alta and Snowbird.</p> <p>The use of selectively placed avalanche sheds will have a positive impact on reducing road closures and snow removal time in those areas deemed to provide the greatest benefit.</p> <p>Bus routes originating from the north and from the south create the most direct/efficient routes to the ski areas. In addition this alternative provides express buses minimizing the number of enroute stops and avoids the two Snowbird stops for riders continuing on to Alta.</p> <p>The Central Wasatch Commission has discussed the inclusion of disincentives for continued private vehicle use such as variable tolling. These tools should be used to support increased public transit or high occupancy use.</p> <p>These options are both faster than alternative 3.</p> <p>We believe alternative 1 is preferred as it can achieve 80% of the gain with less impact to the canyon, than #2, provided that disincentives to private vehicle use are employed.</p> <p>UDOT Alternative 3 — Gondola</p> <p>Other than creating a very sexy travel brochure for two ski areas this option provides little value for the majority of riders, local residents and taxpayers.</p> <p>The transit time of 63 minutes for Alternative 3 takes too long and will not motivate people to get out of their cars and take public transit. For people coming from the south, this calculation does not include the additional car travel time to drive north past the mouth of LCC to the mobility hub to then backtrack to the gondola. This will be a tough sell to local skiers.</p> <p>Alternative 3 presents a false choice. By removing the Snow Sheds and the 94th South Mobility Hub, it shows a false cost savings. These items are necessary and we believe will eventually be included. They should be included to make a fair financial comparison.</p> <p>The exclusion of avalanche sheds for the proposal should make this option a nonstarter. The 70% of remaining car traffic (per UDOT assumptions) will be subject to the same road clearing delays creating the same gridlock for neighborhoods as the present state. UDOT clearly stated that the exclusion of the shed for this alternative was done to make the cost comparison to the other options more attractive.</p> <p>The gondola serves just 2 fixed destinations in the canyon. Hikers will still be driving cars to the various trailheads when the ski season wanes. The gondola will do little to reduce vehicle use year round as has been an objective of Mountain Accord and the CWC.</p> <p>UDOT's vision for the gondola station is that kiss and ride traffic, or riders who otherwise did not originate at the mobility hub, would be prohibited access to the station. We have little faith that such a restriction can or would be maintained going forward. We believe that the gondola proposal is "the proverbial 'camel's nose in the tent". Regardless of how well intentioned UDOT and the political powers are, eventually, the political will to prevent "kiss and rides" and parking at the gondola will fail. This will result in new drop off zones, expanded parking structures, and continued worsening congestion at the canyon mouth, and beyond. We believe that this could result in delays far worse than they are today.</p> <p>Carrying Capacity and Other Issues</p> <p>The additional critical points regarding the future of LCC are related to but not directly tied to the UDOT EIS.</p> <p>Canyon Carrying Capacity</p> <p>When making changes to an existing current state there are desired outcomes and often undesired outcomes that can be anticipated or unanticipated. What do we want the canyon experience to be and how will any related decision impact that vision?</p> <p>Two key published drivers of UDOT's project are safety and reducing/eliminating traffic log jams/delays occurring on powder days. To what degree does a specific transportation choice introduce perhaps an unpublished objective: increase the number of visitors to the canyon?</p> <p>Snowbird and Alta have made public their belief that when their parking lots are full there is still plenty of capacity on the slopes for additional skiers. The comparative density standard they are applying is that of the ski experience found at California resorts which is greater than normally enjoyed here. The Forest Service leaves the management of the skier experience up to the respective resorts.</p> <p>Currently canyon visitor occupancy is indirectly controlled by the limited parking at the resorts, trailhead parking lots and whatever off highway space drivers can find. In many ways LCC's transportation challenges have helped slow use demand relative to an increasing population.</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Craig Osterloh	Email
6101	<p>I am concerned that this plan benefits businesses that already earned oodles of profits over environmental factors and other outdoor recreation users other than ski/snowboard. Bottom line corporate greed. Please do not pass this plan.</p>	Michelle Stein	Website
6102	<p>Dear Sir/Madame,</p> <p>Across the valley from the Little Cottonwood Canyon we have already created an environmental damage to the mountains (Rio Tinto mining). NOW is perfect timing to preserve our nature as much as possible by choosing the least impactful option for the Wasatch forest. Adding daytime-variable toll to account for rush hours will help to reduce the uphill traffic (and PLEASE note that skiing has become very expensive activity, so less cars anyway). The least amount of concrete tunnel construction is the most preferred option for the forest. Please disregard the idea for gondola which will become an insult to already deteriorating landscape in LCC. Also as forest is susceptible to wildfires, it takes only one major wildfire disaster to ruin LLC attractiveness (for visitors) for many years.</p> <p>Thank you for considering my comments.</p> <p>Sincerely, Grzegorz Bulaj</p>	Grzegorz Bulaj	Website
6103	<p>I support increased bussing with road widening! A gondola would be the most expensive and destructive to the natural environment and the aesthetic.</p>	Lauren Macklin	Website
6104	<p>A gondola is the only way and will help with all of the car emissions.</p>	Nikki Magrath	Website
6105	<p>I like the option to implement more busses</p>	Kaylee Shobe	Website
6106	<p>enhanced roadway widening makes the most sense for both summer and winter usage and for an ever growing population in the valley.</p>	Lew Baker	Website
6107	<p>My vote is for increased bus service.</p>	Austin John	Website
6108	<p>None of these options adequately address dispersed recreation - until they do, none are worth considering. The enhanced bus with no additional road capacity is the only option worthy of further discussion. The less additional damage to the canyon we can do for the sake of the reSorts, the better. The gondola option seems like a joke that somehow slipped through? A giant gaudy gondola with visual impacts 24/7 to address a problem that occurs what, 30 days a year at most is complete overkill. Nobody wants to drive to get on a bus to get on a gondola anyway.</p>	TREVOR SCHLOSSNAGLE	Website
6109	<p>I advocate for the "Enhanced bus" option given that it is least environmentally-disruptive as well as least costly ; it likely will improve the air quality in surrounding areas, an important feature given the dangerously high levels of PM2.5 the Wasatch front experiences each winter. I am a physician and have seen the direct impact of poor air quality on adverse health outcomes. Whatever we can do to curb emissions (as vehicles are large contributors to air quality) is paramount.</p>	Dani Babbel	Website
6110	<p>I do not want Little Cottonwood to be altered permanently (widening roads/ Gondola) so that the ski resorts benefit for a fraction of the year. Both widening the road and adding a Gondola have irreversible damage that effects both rock climbing and hiking. I would much rather the the canyon close down to bus only during peak morning and evening hours for ski resort access.</p>	Ben Neilson	Website

	Dear Utah Department of Transportation, I am a 20+ year full-time resident of Alta and as such have an interest in being able to access goods and services (airport, restaurants, visiting friends, grocery and other stores, medical appointments, etc., etc.) in the Salt Lake Valley. Currently, this is very difficult and inconvenient on weekend/holiday afternoons/evenings due to the heavy traffic. The slow moving/idling traffic is also an environmental hazard. In addition, the parking on the side of the road, including the parking on the North side of the road at White Pine in the summer, is a danger to users of the road. I do not support the construction of the gondola as it is proposed. The gondola will not start at a major park-and-ride lot, necessitating a 3-step journey for skiers (residence to park-and-ride, park-and-ride to gondola, gondola to resort). Realistically, I do not see many people doing this over just driving their car up LCC. In addition the gondola will not be stopping at the intermediate trailheads and will not be running in the summer. I see it mainly as a marketing gimmick for the resorts at taxpayer expense. I drive an EV myself and I am in favor of zero-emission busses on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.	Andrew Chandler	Email
6111	Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users such as backcountry skiers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola. As a backcountry skier I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry users. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).		
6112	Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place. I support the Gondola effort for LCC. I believe it will be the best long term solution to avoid parking, traffic, and pollution problems. It will be a tourist summer destination, and address avalanche and road plowing concerns.	Jim OCallaghan	Website
6113	More buses! More buses and more frequently. NO to road widening; studies have shown it does not help ease congestion but instead increases it. More buses and more frequently. Cannot say it enough! Also, traffic at the base needs to be turned around and NOT allowed to sit. By turning cars around, essential personnel (employees of LCC, BCC and first responders) may get through. A gondola in the future in addition to buses is okay but we first must get people used to not being able to take care up canyon. Banning cars that don't belong to employees or canyon residents on weekends and holidays is also a good start.	Marissa Linback	Website
6114	please do not widen the road/ instal a gondola changing the canyon permanently.	Ben Hanna	Website
6115	Please do not instal a gondola or widen the road, this will ruin the canyon for many of its users	Ian Hanna	Website
6116	I am a Salt Lake county resident and I oppose new construction in little cottonwood canyon (options 2 and 3). These proposals are both extremely costly and will adversely impact year-round recreation in the canyon for a seasonal benefit. Expanding bus service is my preferred solution.	John Chamberlin	Website
6117	Do not widen the road, and please of not instal a gondola. both of these options will change the canyon for ever in a negative way	cynthia hanna	Website
6118	No gondolas please!!	Francis Higgins	Website
6119	Enhanced bus, no road widening!!! The investment needed alone should tell us busses are the way to approach this! No to the gondola! No to destroying our beautiful canyon, carved by glaciers over thousands of years! No to catering to the elite who want to maximize their convenience over residents' quality of life. If there is just a three-hour peak window in which the majority of the traffic seeks to access the canyon this is like using a sledgehammer to kill a fly. We can do better, we must do better! Keep the canyon intact address the problems that exist with as a light of a touch as humanly possible.	Erica Marken	Website
6120	Of the 3 proposals, I am most in favor of alternative #1. I prefer this proposal because of the lower capital costs, inclusion of show sheds to help with avalanche control, and no widening of the canyon road. HOWEVER, as a resident of the area, I OPPOSE SIGNIFICANT WIDENING OF WASATCH BOULEVARD.	Paul Hudson	Website
6121	I'm in favor of option 1, supplying more bus transportation. I'm strongly AGAINST option 2 because it endangers the Little Cottonwood Climbing area. Many bouldering zones are very close to the road, and expanding SR 210 could permanently damage this climbing area. Opposed to option 3 because a gondola will be a blemish on a beautiful canyon. Many people of Salt Lake find escape from the city in the nature and views of Little Cottonwood, and a gondola would be a thing impossible to ignore. Finally, I'm frustrated that the ski resorts are taking no responsibility for the problem they create. Alta and Snowbird should shoulder a significant portion of the cost.	Nathaniel Coleman	Website
6122	Please do not widen the road or install a gondola. Enhanced bus Without road widening is the only real option.	James Morgan	Website
6123	Hello! I encourage you guys to choose option #1 as it has the least amount of impact on the beautiful nature that we in Utah are known for. Any of the other options would also be detrimental to some of the climbing access that many people i Salt lake recreate on frequently. Please keep the climbing and hiking community in mind as you make the decision. This constituent really urges you to consider option #1.	Anna Hayes	Website
6124	I tend to agree mostly with the copied comments from an opinion with "Save our Canyons". "If we simply invested less than a quarter than is being proposed in some of these options, \$50 million to \$100 million in buses, transitioning 50-70% of the people out of their vehicles and onto transit well before the mouths of the canyons; if we altered behaviors by not allowing cars to line up, implemented a toll that encouraged 4 people per vehicle, ticketed vehicles for having ill equipped tires, and enforced no roadside parking as should have been done years ago -- we could make a bigger dent in the dreadful traffic woes caused by cars and would have to build nothing more in our canyons. Give it an earnest 5 -10 years, actually funding it like you want to solve the problem. We can continue to investigate long term solutions in the interim. All we know for sure is that the options before us right now, completely fail the users and the environments in the Wasatch, destroying the values that make this place special."	Jake Immonen	Website
6125	As I understand the proposal the point of the project isn't to add more people getting up the canyon, the point is to alleviate the number of people who are already try to get up there. If we were talking about trying to get more people up the canyon the gondola may be a good option as the same amount of people could be on the road with more on the gondola, but it mainly benefits Alta and Snowbird who do nothing to pay for the bill (yet of course Snowbird supports the gondola). Anyone who's ever gotten caught in the snake knows that the bottleneck is usually outside the canyon, i.e. Wasatch Blvd, so the obvious solution is to have less cars congregating to Wasatch Blvd when it snows or on weekends. This could be done with better bus infrastructure systems that take people quicker and easier from different places around the valley. With that said I think all three situations should be reconsidered and re-evaluated. But given that there are only three options, I'd have to say I support an enhanced bus system with no highway widening as it is an immediate start and can be built on to have a better bus infrastructure system. I love resort skiing, BC skiing, running, and climbing in LCC and would love to see a solution implemented that has a benefits for everyone who enjoys LCC instead of just Alta/Snowbird. Thanks for allowing public comment.	Kathy Howell	Website
6126	No, to more pavement, more cars, more pollution, less safety and decreased quality of life on Wasatch Blvd. Please add An option to your transportation plans for Big and Little Cottonwood Canyons. Please increase public transport on existing roads. The natural beauty and habitat of our canyons can't be replaced once it's been developed. Please don't increase road capacity or put in a gondola. We just need reliable bus service. It's worked for National Parks to use shuttle service and it would be good to consider it here. Thank you.	Jen Sather	Website
6127	After very careful and thorough consideration, UDOT should move forward with an increases bus service and snow sheds with no road widening or gondola. A gondola would certainly be beautiful and breathtaking (and perhaps win us the Olympics), but would be environmentally damaging. I am also concerned about the safety of the gondola. Ski lifts tend to break down at least once a year if not more, even if brand new. This leads to a large problem with the possibility of a evac. Who would be responsible? Would it be Alta and Snowbird ski patrol? The other thing to consider is the overall lift maintenance and lift operator cost. At each station, lift operators would be needed, and there would need to be experienced lift mechanics available 24/7. These mechanics would also need easy access to every tower. The gondola, though beautiful, is neither cost effective or efficient. The gondola also does not meet the requirements with LCC's avalanche paths. Each of the lift towers and angle stations would be susceptible to large avalanche damage. A wider road way is the most expensive option. While it does increase traffic and bike friendliness, it is too expensive and has too large of an environmental impact. Keep in mind the changes we make to LCC now, will still be visible in 200+ years.	Sean Parent	Website
6128	As far as tolling goes, that is a smart idea. By converting both LCC and BCC roads to toll roads, not only can UDOT fund the project, but they can also enforce the traction law. This past season UDOT experimented with a new sticker program that certified cars that passed inspection. What if we go further. Every year car owners in the state of Utah have to renew their registration. Well what if we added an about \$150 optional fee. This fee would work as a summer and winter pass for the canyons and would also certify the car AND the driver as following the traction law and knowing how to drive in snow. The driver would have to pass a written or perhaps powerpoint test to get the certification and the car would have to meet all aspects of the certification. Then, the driver would receive a custom license plate with the UDOT winter sticker on it. Then when the driver approaches the toll booth, either the operator or an automatic scanner sees the license plate and lets the car go through. Now maybe that fee is \$200, but it needs to be under \$250 for people to stay interested. Thank you. The Gondola Plus La Caille Base station is the best solution for Little Cottonwood Canyon from a transportation, environmental and financial stand point. I urge you to move forward with this proposal. Thank you for your consideration.	Hans Fuegi	Website
6129	EIS LLC comments I am against the 3 proposed solutions to the Little Cottonwood Canyon traffic issues. The main reason is that the proposals for bus only operate the buses in the winter. UDOT is essentially suggesting giving the Canyon ski resorts around \$400 million dollars in services and projects! The buses are proposed to only operate in winter due to the observation that they don't see traffic like in winter. The gondola was supposed to be for winter only but you say that it will depend on the survey. Again, UDOT is suggesting hundreds of millions of dollars in services and projects for ski resorts (and Canyon Center or other development parking garages). I do not believe that most Utahns will appreciate that and it really is not a solution. I agree that the gondolas will interfere with avalanche control. I also agree that the priority should be snow sheds first (big enough to handle extra large buses). The second priority should be to expand the shoulders which should be used for a separated bike lane. The third priority should be to expand parking with restrooms next to trails. 6 million visitors need more than a handful of restrooms. The fourth priority should be to provide weekend bus service that stops at trails. That will prove use of transit is possible. UDOT should not be removing 200 out of 900 parking spots to force transit use. Transit is probably going to be unused for the next ten years and UDOT should never ever discourage use of personal vehicles (or give up and disband). And UDOT should make it clear that ski resorts, through an assessment, should pay for the projects and services (services in winter). I am against tolling which discourages personal vehicle use. It's use in winter will result in a backlash against ski resorts, which Utah is marketing. Why market services if they create congestion is the argument. Again, the EIS should provide a priority list that has snow sheds, soft shoulder separated bike lanes, expanded parking and many more restrooms, test weekend bus service (with expanded bike storage and maybe even topless tourist buses) to see what it will take to get people to take transit. Spending tens of millions on parking garages at the mouth of the canyon should not be done without confirming people will use the buses. And parking garages for winter bus use effectively gives developers tens of millions for a few months of use.	George Chapman	Website
6130	George Chapman Option of only additional buses is the least impact on the canyon. Limiting private cars reduces traffic! There is no guarantee that widening roads and gondala installation will mitigate traffic!	Erica Lee	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6131	<p>I am against the 3 proposed solutions to the Little Cottonwood Canyon traffic issues. The main reason is that the proposals for bus only operate the buses in the winter. UDOT is essentially suggesting giving the Canyon ski resorts around \$400 million dollars in services and projects!</p> <p>The buses are proposed to only operate in winter due to the observation that they don't see traffic like in winter. The gondola was supposed to be for winter only but you say that it will depend on the survey. Again, UDOT is suggesting hundreds of millions of dollars in services and projects for ski resorts (and Canyon Center or other development parking garages). I do not believe that most Utahns will appreciate that and it really is not a solution. I agree that the gondolas will interfere with avalanche control.</p> <p>I also agree that the priority should be snow sheds first (big enough to handle extra large buses). The second priority should be to expand the shoulders which should be used for a separated bike lane. The third priority should be to expand parking with restrooms next to trails. 6 million visitors need more than a handful of restrooms. The fourth priority should be to provide weekend bus service that stops at trails. That will prove use of transit is possible. UDOT should not be removing 200 out of 900 parking spots to force transit use. Transit is probably going to be unused for the next ten years and UDOT should never ever discourage use of personal vehicles (or give up and disband). And UDOT should make it clear that ski resorts, through an assessment, should pay for the projects and services (services in winter).</p> <p>I am against tolling which discourages personal vehicle use. It's use in winter will result in a backlash against ski resorts, which Utah is marketing. Why market services if they create congestion is the argument.</p> <p>Again, the EIS should provide a priority list that has snow sheds, soft shoulder separated bike lanes, expanded parking and many more restrooms, test weekend bus service (with expanded bike storage and maybe even topless tourist buses) to see what it will take to get people to take transit. Spending tens of millions on parking garages at the mouth of the canyon should not be done without confirming people will use the buses. And parking garages for winter bus use effectively gives developers tens of millions for a few months of use.</p>	George Chapson	Email
6132	<p>UDOT Project Team members,</p> <p>Thank you for the opportunity to comment on the proposed draft transportation alternatives for the Little Cottonwood Canyon EIS. Attached is a letter representing comments from Salt Lake County Mayor Wilson.</p> <p>Please feel free to reach out if you have any questions or need further information.</p> <p>Helen</p>	Helen Peters	Email
6133	<p>Thank you for the opportunity to comment on UDOT's Little Cottonwood Canyon Environmental Impact Statement Draft.</p> <p>This will be my 25th ski season in Utah (I moved here in 1996 from NY) and I have seen incredible change both in the canyons and in the Salt Lake valley over time. We are Alta/Snowbird and backcountry skiers, climbers and mountain bikers. My two teenage sons have grown up in Little Cottonwood Canyon; it is our sanctuary and we want to preserve its natural beauty.</p> <p>I suggest we start by leveraging some of the resources that exist today to expedite a solution, with additional environmental impact studies to follow. The most immediate impact can be made by greatly enhancing the UTA bus service, however the busses must emit zero emissions in an effort to limit the anthropogenic climate change that is occurring as a result of the population explosion in Utah and ultimately, in our canyons. The busses should also have employees well trained in driving up and down snowy canyon roads as well as be equipped with snow tires and/or chains.</p> <p>With the increase in zero emission UTA busses there should also be some consideration given to determining how to better leverage the existing lanes and a study on how an additional lane may be added in the future. As an example of how to utilize the current road, traffic can be directed such that there is uphill travel only during peak morning and downhill only during late afternoon hours on high impact days.</p> <p>It's important to bear in mind that not everyone in the canyon is going to Alta or Snowbird; each year there is an increase in the number of backcountry skiers and climbers enjoying the beauty of and recreating in Little Cottonwood Canyon. Deliberate thought should be given to how people can continue to easily access the Gate Buttress, Lisa Falls, Coalpit, Y-Couloirs, Tanners, White Pine, Superior, and Hellgate.</p> <p>Roadside parking should not be eliminated, as there will always be a need for people to drive their cars and park in the canyon. Trailheads need to be easily accessible. Additionally, an impact study regarding having bus stops at highly used trailheads may be considered. Increasing the UTA bus service in Little Cottonwood Canyon will require additional bus stops and parking along Wasatch Boulevard and 9400 South to allow more people to ride the bus and to accommodate the additional busses.</p> <p>It seems many individuals and companies are in favor of the proposed gondola system. I fear this will not only add more people to the canyon, it will change the beauty and possibly disrupt the natural habitat. The cost, environmental impact and impact to recreation should be more closely evaluated. We certainly don't want or need more people coming to the canyon for the novelty of riding up a gondola. The cost and time to build this solution is high and it will take years. We need a quick remedy now with continued solutions for the future.</p> <p>Based on the information provided related to the gondola, it sounds as though it will take people about 90 minutes to get to the resorts. Driving or taking the bus to a parking hub, waiting and then riding the gondola takes time. Not everyone that recreates in the canyon has the time to use on transportation each day. Recalling back to when my sons were young skiers on the Snowbird ski team, it makes me sad to think that families may have to take a gondola, with all that gear, to the resort. Much of our "family time" was driving up the canyon talking about the fun we were about to have and recalling our day while driving down the canyon. Further, the ski teams are released early from school and train every afternoon. Many of the ski racers carry all their gear and at least two pair of skis each day. Having to take all the extra time to get to the resort would make afternoon training impossible. Lastly, the schedule must be evaluated so that people can get down the canyon later in the evening or at night after having taken the gondola up during the morning or afternoon.</p> <p>As I mentioned initially, there has been an explosion of people in our state. However, there are really only perhaps 20 or 25 days a season in which the canyon is closed for avalanche mitigation later than about 8:00 AM and the traffic is really bad on those mornings. There are also days when driving down at the end of the day results in long waits (in the "red snake"). I've seen that cars without all wheel drive and snow tires are allowed to drive up, even when a storm is in the forecast. This is often what causes" an issue driving up and down. While there has been more of a police presence at the mouth of the canyon monitoring for all-wheel, 4-wheel and snow tires, there isn't enough being done to manage the cars and traffic. Many people are under the impression that all-wheel or 4-wheel is enough. It is not. Snow tires are an absolute necessity and the use of them must be enforced.</p> <p>In closing, I'd like to thank you again for the opportunity to share my perspective and encourage additional and deliberate thought and consideration be taken to minimize the environmental and financial impact of all proposed solutions.</p> <p>Sincerely, Ilene O'Reilly</p>	Ilene O'Reilly	Website
6134	<p>As a resident and home owner in the Wasatch Front and Salt Lake County, I would like to voice my support for the simpler public-transit alternative, i.e., Alternative #1, as described in the LLC EIS.</p> <p>My choice is based upon these considerations:</p> <p>Given that Little Cottonwood Canyon (LLC) is a unique natural resource within proximity of over 1 million residents, and receives millions of visits per year – preventing further development of large-scale structures within the canyon should be prioritized, thus another gondola-type development is in the wrong direction. Better planned, and more accessible, public transport from throughout the SL valley could also lower the impact on Wasatch Boulevard and the parking crisis which exists at the mouth of both LC and BC canyons.</p> <p>By some assessments only 10 days per year actually overwhelm the uphill capacity of current alternatives. Therefore greater volume of bus and public transport could greatly alleviate the vehicle congestion, if provided in an efficient manner. The gondola alternative would seem to create different traffic jams (at the access and transfer points) at enormous cost, and irreversible cost to the landscape and ecology of LLC, and may not even be used at all in the non-winter months.</p> <p>Any transportation solution should be flexible enough to serve the many destinations, and many activities in the canyon, beyond the two resorts. The resort traffic, which admittedly drives the worst traffic situations in the winter, is overall not the greatest public utilization of the canyon. All the many other activities documented in the EIS are important for an improved transport system to serve, all year long.</p> <p>It is also true that, from our vantage in 2020, we are not able to predict exactly how the transportation needs will evolve, so the most flexible alternative should be favored.</p> <p>A liability of the gondola alternative, I did not see discussed in the EIS, is the potential disaster in the event of a power outage in the canyon (which I suspect happens nearly every year for short periods). How could all the passengers on 30, or even 15, full gondola cars be evacuated, in event of a power outage? Not without an enormous, expensive, and potentially dangerous rescue operation.</p> <p>There are other objections I have to the breadth of the EIS, i.e., how can LLC's problem be addressed without considering all the Wasatch Front canyons? But for now, please consider my choice of the three options offered.</p> <p>A concerned citizen, Peggy Riedesel</p>	Peggy Riedesel	Email
6135	<p>After looking at the proposed solutions, I am writing to submit a comment in support of the gondola plus LaCaille base station. It will reduce traffic in the canyons, and eliminate the need for harmful road widening. I believe the gondola has many positive outcomes as compared to the bus solutions, whose construction solutions, including the snow sheds, will be much more destructive.</p>	Alexa Kalandiak	Website
6136	<p>I support the Enhanced Bus Transportation Option for LCC (and hopefully BCC). A major factor that needs to be addressed regardless of which route is taken is the parking at the base of the canyons and bus stops. They already get parked out on weekends or high traffic days in the winter. If any of these propositions are to be successful the parking spaces need to be increased drastically at all major bus hubs!</p> <p>Hi and thank you for all the work you've put in to date to secure a great future for LCC!</p>	Remy Smith	Website
6137	<p>I'm in favor of Enhanced Bus with Roadway Widening for Peak Period (Shoulder Lane).</p> <p>Looking forward to the improvements! Have a great day!</p>	Christopher Smith	Website
6138	<p>A gondola is a horrible idea, it will ruin the atmosphere and general feel of the canyon.</p>	Colin Lunetta	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6139	<p>To whom it may concern,</p> <p>I'm writing to comment on the alternatives proposed by the LCC EIS. I don't believe any of the alternatives proposed would benefit the cottonwood canyons, and would negatively alter the character and natural beauty of the canyons.</p> <p>1. The gondola idea is a monstrosity. It would completely alter the character of the canyon, and would do little to actually get enough people during the 3 peak hours of congestion on powder days. If it can only transport 900 people an hour, and on peak days there are 21,000 people trying to get up the canyon, then it will clearly fall short. With the huge parking lot at the bottom, it will just push the driving problem down the canyon, not solve it.</p> <p>2. The enhanced bus options are good, but I have great concerns about the construction of avalanche sheds and berms.</p> <p>One of the most impactful things that could solve the congestion problem for Little (and Big) Cottonwood Canyon is to invest in UTA's ability to enhance bus ridership starting in the valley and disincentive driving. Charge tolls, enforce carpooling, and make snow tire laws stricter. Make streamline bus routes that don't make frequent stops so people will actually ride them.</p> <p>Building a bunch of new infrastructure in LCC won't solve this problem. We need to expand bus services throughout both canyons and the city.</p> <p>Thanks you,</p> <p>Eric Balken</p>	Eric Balken	Email
6140	<p>I appreciate the efforts to address the Little Cottonwood Canyon transportation issues as the last few winter seasons have proved we are at a point where the current system simply does not work. I support the gondola project in hopes that it will reduce vehicle traffic in the canyon and improve air quality in the salt lake valley. While buses would be the easiest to implement, they are only a short term fix to a problem that has been discussed for decades. Avalanches and heavy winter snowfall will continue to wreak havoc on the winding, narrow road, regardless of snow sheds or other infrastructure. While the gondola project is not perfect, it is in my eyes the most realistic solution to address the growing visitation of Little Cottonwood Canyon.</p>	Ben Emery	Website
6141	<p>Please choose the gondola option.... plan ahead for the next 50 years!</p>	Mark J Fischer	Website
6142	<p>I am in favor of a Gondola with a La Camille Base Station. I would also like to see UDOT have MANDATORY Traction Control Rules in effect for all vehicles from November 1 to May 31. In addition, I would like to see UDOT implement a toll tag system for Little Cottonwood Canyon which might encourage more carpooling.</p>	Buster Fitzgerald	Website
6143	<p>Please prioritize public transit options rather than widening lanes and increasing traffic in the LCC.</p>	Shannon Conk	Website
6144	<p>The least impact to the canyon environment is what I support. The Enhanced Bus Alternative without widening roads I believe accomplishes this best.</p>	James DeSpain	Website
6145	<p>Favoring Enhanced Bus Having used public transportation for 20 years in a major city, I know it can be a great option given that it is: Safe; Reliable; Convenient; Economical The bus system in place lacks these as I ride daily.</p> <p>Suggestions for improvement: Adhere to schedule; Express buses to Alta and Snowbird; Multiple starting points throughout Salt Lake using Little Cottonwood park& ride as a hub/ transfer to canyon specific express busses that run continuously.</p> <p>These improvements could be implemented immediately without any infrastructure improvements. Results could be analyzed quickly.</p> <p>Tolling on Hwy 210 would increase the economic advantage of bus ridership.</p> <p>There are relatively a small number of big snow days each year when the traffic in the canyon backs up. 95% of the time there is little or no delay getting up the canyon, and midweek there are usually minimal parking issues.</p> <p>Gondola (Almost as dumb of an idea as the train) So, you are saying you want me to spend a lot more money to wait a whole lot longer to ride a gondola? There are so many problems with this gondola idea, I'm not sure where to start. But let's start with money...</p> <p>Costs per Rider Any idea of how much it is going to cost to ride the gondola per person? \$10? \$20? Each way? I would love to see your model for how you think this is going to pay for itself. Are your estimated operating and maintenance costs taking into account the losses you will likely incur from low ridership? Are our tax dollars subsidizing this goofy project when you can't get enough people to ride? So, how much would it cost for a family of 4 to take the bus and gondola up and back to Alta for a day? \$80-\$120? Is this a sustainable model if you only end up having heavy traffic on it for 10-20 days per ski season? I highly doubt it.</p> <p>Time to get there (and back) Once I reach the mouth of the canyon, in my car, it takes me an average of 10 minutes to reach Snowbird. Your estimated times to ride the gondola are 5 or 6 times longer than that (even longer for those continuing on to Alta). That makes absolutely no sense to me, especially if I only want to go ski for an hour or two.</p> <p>One of the reasons tourists enjoy coming to Utah to ski (I've talked to many over the years) is because (unlike Colorado), they can get from the airport to a handful of resorts in less than an hour. You are talking about (at least) doubling that time. So, who exactly are you marketing to? Tourists? Locals? Gondola enthusiasts?</p> <p>Wind Delays The Snowbird Tram closes regularly due to high winds in the canyon. What are the wind tolerances for your proposed gondola? So, what happens when winds shut down the gondola and you have busses dropping off hundreds of people at the gondola base station?</p> <p>More Bottle-Neck! Some of the proposed Gondola plans that I have seen include large parking structures at or near the mouth of LCC. So, essentially, you want to take a natural bottle-neck area and put a cork in it! Parking structures will be a nightmare on busy mornings causing even more delays as people try to navigate to a parking space in a multi-story parking structure.</p> <p>Disneylandification of LCC How much are Snowbird and Alta going to chip in to build and maintain this 'Disneyland' Ride up our canyon? Those are really the only two Of course the resorts want the gondola. That is just one more neat attraction that will help differentiate their resorts and attract more people. They don't care if very few people ever use it or that it will never pay for itself. For the resorts, it's just a really cool looking marketing brochure. The problem is that the rest of us, living down in the valley, are paying for their marketing budgets...in perpetuity!</p> <p>Snow Sheds This one is a no-brainer. Yes, we need snow sheds! Most of the closures in the canyon are due to avalanche mitigation and cleanup. The snow sheds could dramatically reduce the amount of time the canyon is closed. These closure delays also tend to coincide with large storms which attract the most number of people to LCC...so it is a win/win. I have seen snow sheds used successfully in Canada (Banff National Park). Build them, already!</p> <p>Extra Lanes and Busses I don't believe we need additional lanes all the way up the canyon. It might be nice, but I understand there are a number of places where it would be difficult or cost prohibitive to add another lane. You could add another lane up most of the canyon, however, which could alleviate a lot of problems, including additional passing lanes.</p> <p>The first up-hill passing lane in LCC is over 4 miles up the canyon. On heavy snow days (and heavy ski days) traffic flow up the canyon is reduced by the 'weakest link'. The weakest link includes non-4WD vehicles that struggle on wet, slippery roads, large/slow trucks, inexperienced winter drivers, cars with poor tire tread, etc. Only one of these weakest link scenarios can back up the entire canyon. Having more up-hill passing lanes will enable slower traffic to move over and allow other vehicles to pass and keep traffic flowing.</p> <p>Busses are also the most scalable option. Schedules can be adjusted (or eliminated) depending on demand. Building, running and maintaining a gondola has high sunk and fixed costs. The ability to adjust schedules and expenses to meet demand is just not possible.</p> <p>Other options to consider:</p> <ul style="list-style-type: none"> • How about building a bus Park & Ride near 9400 S 2100E in the old ShopKo parking lot? • Why are we never asking the question about the capacity of Alta and Snowbird? There are only so many people that can safely be on the mountain. Figure out how many people you can have on the mountain and then come up with a parking and public transportation plan to match that capacity. • Anecdotally, I have noticed a significant increase in traffic and skiers since the resorts implemented the IKON pass. Maybe we should be looking at how resorts are marketing their products and if they are negatively affecting our traffic flows. 	TMP	Email

6147	<p>Of the three options, I believe the gondola to be the best.</p> <ul style="list-style-type: none"> -Least disruptive to the environment, a little unsightly but fitting and cool. -Operable during storm events. -Easy to market and obtain ridership. -No disruption to roadway and more importantly the watershed. -Sets the stage for the future. <p>The challenge is the MAJOR shuffle it will require to participate. A solution that includes a base station location that has a parking lot and amenities would push this from novelty to success. The private development group's land although a step in the right direction, still doesn't seem best as it doesn't have access from both LCC Road and Wasatch. A better option would be the Tree Farm Property as it has access to both Little Cottonwood Road and Wasatch Blvd. I believe this would accommodate busses and traffic more efficiently. Better yet would be to locate it on 9800 and Wasatch at the Earth Quake Park. This location would be in better alignment and provide better access for busses.</p> <p>My personal experiences riding the busses on storm days have been miserable. I have my fingers crossed that I don't end up reading about a tragic slide out.</p> <p>The gondola adds another tool to our quiver, it opens up egress during events that close the road.</p> <p>Would like to see better bike lanes and safety for pedestrians throughout the length of the study area. Not a fan of excessive widening of Wasatch Blvd. would rather see solutions that promote mass transportation and alternative modes of transportation. I would like to see 35 MPH throughout the length of the study area. A variation of Sandy's Wasatch Blvd. is preferred vs. the belt route. People want recreation and access to recreation not traffic going 50 mph.</p>	Jon Koenig	Website
6148	I prefer the option of enhanced bus with roadway widening. As a skier and cyclist I like the benefit of a dedicated cycling and pedestrian lane in the warmer months, since traffic up the canyons has exploded in recent years and it's become unsafe for cyclists. I think the gondola alternative is unrealistic, with a longer time to reach the resorts, likely peak usage only on a few days in winter, and need for parking structures and transport to the gondola. I believe the roadway widening will have a higher return on investment for canyon usage with additional non-motorized users year round, despite the higher up front capital and ongoing costs.	Dan Chace	Website
6149	Hi, my concern is spending large amounts of taxpayer money to help two private businesses accommodate more guests at the cost of other user groups. Why not mandate bus travel for non residents and non employees during peak use periods and provide more parking down low. It seems like Alta and Snowbird should provide alternatives and funding then present them to the county and public for approval.	Kyle George	Website
6150	I support the option for enhanced bus services without road widening in LCC. I don't support any plan that would disrupt more recreation areas and wildlife.	Dalton Remigi	Website
6151	We must preserve and protect Little Cottonwood Canyon. Please consider transit option 1 to keep access available to all users of the recreational area.	Liam Myers	Website

6153	I'm in support of the Little Cottonwood Gondola. As a yearly Snowbird pass holder this would help greatly in moving people up and down the congested canyon.	Riley Young	Website
6154	<p>I am a snowshoer, biker, and hiker who frequently travels up Little Cottonwood Canyon (LCC) for outdoor recreation and I appreciate this opportunity to comment on the LCC Environmental Impact Statement. I agree with the Wasatch Backcountry Alliance's comment in full, but I will highlight a few of the most pertinent points to me in my comment.</p> <p>I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low- or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC.</p> <p>LCC is an important part of the Salt Lake City watershed. Therefore, it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing (and maintaining) a gondola will have a larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure.</p> <p>Additionally, busses will provide service to more users than a gondola. The gondolas will only stop at the ski resorts, which does not help alleviate overcrowding at other parking lots and does not benefit any of our other tax paying recreationists. A gondola would essentially be a tax-payer funded ski lift solely to the benefit of the corporations that run Alta and Snowbird. Buses would not only be more environmentally friendly, cost friendly, and flexible, they would also serve a greater percentage of our recreationists.</p> <p>As a hiker and biker, I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>I also support incentives to get cars off the road year-round in the canyons, such as increased parking costs at the resorts and tolls for road access. I am a strong proponent of the idea that the people using services should be the ones paying for them, and as a frequent user of LCC, I would gladly pay my part to continue to access this great public land. After all, this is public land, not Alta/Snowbird land, and a solution should be chosen that benefits the entire public, not a select few.</p> <p>I strongly oppose the gondola as I do not believe the benefit will be worth the cost financially or environmentally.</p> <p>Enhanced busing with no widening of the LCC road is a solution that can have an immediate impact. There is no need to wait years to construct additional, expensive, infrastructure when we can alleviate the traffic issues with the infrastructure that is already in place.</p>	Brian Bass	Website

6160	<p>After all of that work, these are the three options? Awful! Let's address regional transportation issues and have the LCC solution fit within this regional approach. This limited scope EIS presents three options all of which are thinly veiled give-aways to Snowbird and Alta. If the transportation will stop nowhere but at Snowbird and Alta have the resort owners pay for the solution and they can pass the cost along to their winter customers. Why are tax payers paying for resort-only transit?</p> <p>Parking Hub:</p> <ol style="list-style-type: none"> 1) The number of parking spots at the Hub is ludicrously low compared to the carrying capacity of the either the Gondola or the enhance buses. 2) We need several parking hubs dispersed throughout the valley including near the population centers in SLC, by Millcreek Canyon and Exit 6. 3) "smart" parking technology at any parking lot such that people can make reservations, forfeit the reservation if they don't arrive by a certain time; have visibility if any parking exists to prevent cars looping around the parking in search of parking spots that don't exist <p>Public transit to the ski buses</p> <ol style="list-style-type: none"> 1) Need to have reliable transit lines that carry skiers to the ski bus 2) The ski bus should only go up/down the canyon in order to maximize these expensive, rugged winter mountain-ready buses. 3) Season pass holders can use these feeder transit lines for free 4) Extend trax red line all the way down Wasatch at least to the gravel pit; this extension can also serve to ease traffic from the eastern benches to the University of Utah, and downtown; these two areas are growing at an enormous rate and yet they are NO reliable transit to either from the eastern benches. Why is this? <p>Ski buses with designated passing lanes</p> <ol style="list-style-type: none"> 1) Let's have passing lanes that are for buses only –UTA access only. <p>Canyon fee and incentivizing carpooling. Please provide details on strategies for promoting carpooling</p> <ol style="list-style-type: none"> 1) How dynamic will the pricing be? Change hourly? 2) No charge if 4 people in the car; sliding scale below that with hefty cost for 1 person – e.g. \$25 on weekend/holiday/powder-day. Infrared sensor technology and automated tolling can facilitate this tiered tolling process. 3) Different rates for weekday vs weekend/holiday/powder-day 4) Charge non-Utah residents more since they are not paying Utah income tax that is effectively underwriting the transportation solutions. 5) Will fees start at the mouth of the canyon or above White/Red Pine TH? <p>Enforce snow tire, 4x4, tire chain, traction requirement every day in the winter season unless there is 0% chance of snow</p> <ol style="list-style-type: none"> 1) Accidents continue to happen when these are not enforced at the canyon mouth 2) Letting non-winter ready vehicles up the canyon in the morning has led to accidents when it snows later in the day. If the car can't handle changing mountain conditions they should never be allowed in the canyon in the winter. Period. <p>Snowshed: will these work? Or will the snow slow down and stay put directly on top of the snowshed? I am not a highway engineer, but I am an engineer. Is the roadside topography in BCC and LCC conducive to these very expensive strategies being successful? Or will they cause a headache when the snow stops just over them, risking failure. The engineers in the presentation could not address this concern.</p>	Sarah Inwood	Website
6161	<p>Thank you</p> <p>As the plan is currently laid out, certain climbing areas will be affected. The plan must be altered to preserve these locations</p>	Peter May	Website
6162	<p>Hello,</p> <p>After further review of the data, I would like to change my comment.</p> <p>At this time, a gondola is not necessary or advisable. It may be a good option in the future, but not right now.</p> <p>Thank you,</p> <p>Liza</p>	Liza Springmeyer	Email
6163	I spent my entire life recreating in LCC but beginning last winter my family and I made the switch to Sundance. We live 3 miles from the mouth of the canyon and on a weekend morning it takes us the same amount of time to drive to Sundance as it does to get to Alta due to the traffic. Out of all the options, the gondola makes the most sense. As you look around the world, particularly in the Alps and in cities like La Paz, Bolivia, gondola's have positively improved the ability of people to move around. The change I would make is have the gondola begin at 9400 S and Highland rather than try to bus people over from the gravel pit by BCC. Trying to bus people is going to add tons of time and you have a lot of parking space already at that intersection between 3 shopping centers. It also avoids the cost of building a parking structure.	Jonathan Campbell	Website
6164	This would be so much better for our canyon's air and environment, not to mention a great investment!	Allison Cowdell	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6165	<p>Hi and thank you for your hard work on the LCC EIS. I have already submitted detailed comments and this is a summary of my view of the LCC EIS and some thoughts after hearing many others' comments. I will focus on the LCC section rather than commuter traffic on Wasatch Blvd.</p> <p>I believe that UDOT has correctly focused on the LCC EIS Purpose and Need to develop the Draft Alternatives. The problem that needs to be solved is the hours-long traffic backups in LCC (and across Wasatch Blvd) that primarily result from thousands of cars going to and from the ski resorts. There are many root causes of this problem: the road is steep and curvy, the road can be covered with snow and ice, the visibility can be bad due to snow and clouds, the road is sometimes shut down due to avalanche control explosives work or avalanches, some drivers are inexperienced at driving in the snow, some cars are not outfitted with four-wheel drive and snow tires, some drivers drive too fast for the conditions, and the number of cars trying to use the road is over its capacity. The combination of a few of these factors severely limits the mobility, reliability, and safety of the canyon road. These root causes can not be solved by road-based solutions alone, as it only takes one slow vehicle or accident to shut down or limit mobility, safety, and reliability in LCC.</p> <p>I would like to make some additional comments concerning other stakeholders' concerns that I have heard:</p> <p>Some say this is a giveaway to the ski resorts at the expense of taxpayers. This is a public road transportation problem that needs to be solved by the public agencies. Our ski resorts are world-class ski areas that significantly add to the regional and state economy. The ski resorts may be willing to pay to operate a gondola if that was to be selected.</p> <p>Many commenters on the EIS Alternatives feel that adding to the roadway facilities (another lane or gondola) is not needed and that just increasing bus frequency can solve the problem. I do not believe that is true for several reasons, such as the number of large number of specially outfitted buses and drivers needed, the difficulty of adjusting bus schedules to day to day demand fluctuations, and the fact that one accident can close down the road.</p> <p>Many feel that the transit solution needs to be able to service the several trailheads along the road for dispersed recreation. While I agree that we should have transit vans or buses that service dispersed recreation, that is not the primary problem in LCC that needs to be solved. In LCC, the primary year-round recreation nodes are the ski resorts, and the White Pine Trailhead is only one mile from the Snowbird Center on an existing trail.</p> <p>Many feel that a ski resort destination gondola transit will not serve year-round recreation and that it would have limited operating hours. A transit gondola can certainly be operated year-round and from early morning to late at night.</p> <p>Some feel that the LCC solutions should be able to translate over to BCC. These two canyons are very different in geography, road length and grade, and the number of dispersed recreation sites. BCC solutions will likely be very different from LCC solutions.</p> <p>Many feel that road tolling needs to be specifically addressed in the LCC EIS. While I generally agree that disincentives to cars are needed, this could be addressed by parking fees at the resort parking lots and eliminating roadside parking as well as by tolling on the road. The topic of logistics of parking and transit to a gondola and vehicle disincentives should be fully discussed in the LCC EIS.</p> <p>Many feel that having to take a bus from a distant parking area to a gondola base with no parking will be a serious disincentive to its use. While I see the need to reduce resort traffic to the mouth of the canyon by not having parking at the gondola base, Wasatch Blvd. is not the root cause of that traffic problem, rather it is from backup from within the canyon. For year-round optimal use of the gondola and the cost of transit from mobility hubs to a gondola base, I see merit in a parking garage at the gondola base. Possibly it should have a substantial fee in the winter and be free in the summer.</p> <p>Thanks again-</p> <p>John Knoblock</p>	John Knoblock	Email
6166	<p>After further review of the information, I would like to change my earlier comment. At this time, a gondola is not needed and will cause only increased harm to the canyon. It may be a good option in the future, but for many reasons, it is not a good option now.</p> <p>Attached please find comments from UTA regarding the Little Cottonwood Canyon EIS Draft Alternatives.</p>	Liza Springmeyer	Website
6167	<p>Please let us know if you have any questions.</p>	Patty Garver	Email
6168	<p>I believe a gondola is the most appropriate solution for environmental reasons. I think a parking lot at the base of LCC should be considered as well.</p>	Jennifer Eden	Website
6169	<p>I am writing to state my support of Little Cottonwood Canyon EIS option 1 (enhanced bus service, snow sheds, NO road widening. The other options will significantly affect my ability to recreate in the canyon, particularly the option that utilizes a gondola. Widening the road will cause significant environmental impact to the canyon corridor, and I do not support that option either.</p>	John Evans	Website
6170	<p>It would be so much easier for tourists coming to ski on the greatest snow on earth to grab a train at the airport than any other mode of transportation. I can't believe anyone who's gone to Europe and used their rail wouldn't want MORE rail where they live! It takes so many cars off the streets! Not to mention people who want to be texting -if they are the driver! Rail would help for safety with that too. It seems like such a no brainer to use rail!!! I have so wish there were rail from Utah State (and/or any college) for my kids looking for rides to and from home. When Trax was proposed people thought it wouldn't be used, boy were they wrong! Trains are so convenient to use! Using rail as the transportation from the airport to the ski lifts is the smart option! Trains are so convenient to use! PLEASE! Realize this before it's too late.</p>	Nicole Killpack	Website
6171	<p>Thank you for taking the time to submit your comments for the Little Cottonwood Canyon EIS, these have been recorded and shared with the project team.</p>	Bradley Beecher	Email
6172	<p>I am in favor of increased bus service up Little Cottonwood Canyon with no additional lane capacity. The Gondola option sounds expensive and expensive to maintain. It also creates a negative impact on the canyon, including the climbing and hiking community. The extra lane will hurt the watershed. The increase bus service seems like it has the least negative impact and is the most beneficial option.</p>	Kimberlee Sieverts	Website
6173	<p>I am writing to state my support of Little Cottonwood Canyon EIS option 1 (enhanced bus service, snow sheds, NO road widening. The other options will significantly affect my ability to recreate in the canyon, particularly the option that utilizes a gondola. Widening the road will cause significant environmental impact to the canyon corridor, and I do not support that option either.</p>	Michele Evans	Website
6174	<p>Option 1 is the only acceptable choice as it has the least impact on the public lands used by many. Destroying public lands or limiting existing parking would be a tragedy --especially to serve two for profit businesses with tax payer money.</p>	Madisen Quesnell	Website
6175	<p>I just wanted to show my support for the gondola concept over the additional bus lane.</p>	Hayleigh Chavez	Website
6176	<p>This is a really exciting opportunity for both Salt Lake Valley residents and visitors to take advantage of this beautiful canyon. Buses and a gondola will be particularly great in the winter for people who don't have cars with snow tires or 4-wheel drive. I'm looking forward to these new transportation options!</p>	McKenzie Spehar	Website
6177	<p>I dare you to make a change bet you want.</p>	Stanton Mayer	Website
6178	<p>I oppose gondola option. I prefer more buses. I admit that I generally drive up though with at least 1 other person to either Alta or Snowbird during ski season and drive up in the fall and summer to hike or just view the scenery. I live in Cottonwood Hts and one reason my husband and I moved here was for the closeness of the Cottonwood Canyons. Whatever plan is chosen should minimize environmental impacts. Encouraging car pooling and bus use and paying for parking are all ideas I support. Traffic is congested only during ski season, at certain hours, and during fresh powder days. So further consideration should be given to traffic mitigation on those days.</p>	rochelle kaplan	Website
6179	<p>I am strongly in favor of the enhanced bus option (no road widening). As long as sufficient investment is made in base parking options and resorts chip in with shuttle options for their staying customers, this makes the most sense. This option allows for some flexibility for winter users who do not only head to the resorts. A useful supplementation for this option could be closing the canyon to uphill vehicles (except for essential vehicles, residents' vehicles and buses) between certain hours (7am to 2:00pm or some such). For any of the options provided here to work best, some restrictions will have to be imposed on passenger vehicles in the canyons. Finally, if only LCC is paid attention to, our problems will not be solved. The enhanced bus option could be applied to BCC as well, whereas none of the other options could.</p>	Steve Downes	Website
6180	<p>I am against a gondola option as it will impact the aesthetic quality of the canyon. Additionally, it would serve less of a function in the summer season. I am in favor of enhanced bus service.</p>	Ryan Wadge	Website
6181	<p>As a almost annual visitor to SLC to ski I support the Gondola option as long as there is sufficient parking and EASY access to the Gondola at the base. This is the only option for providing service in almost any weather condition. I did read it would a 30 person Gondola car. I believe this is a mistake it should be a 8 seat car which more cars on the line. Granted renting 4 wheel drive vehicles is so expensive and even then they still do not have snow tires or chains I'm still in a bind when it snows and want to visit the LCC. It seems like the lift towers and terminals would have a minimal impact on the canyon itself. These gondolas could be linked to additional Gondolas in the BCC and to Park City in the future. The road is a constant maintenance issue and is always dangerous especially with snow and ice. Buses aren't immune to the conditions. Thank you.</p>	Nick Bomar	Website
6182	<p>I would like to share my support of the gondola versus the additional bus lane. I think it is important to consider the environmental impact of the additional busses as well as considering those who would not want to use a bus at all.</p> <p>Thanks</p>	Hayleigh Chavez	Email
6183	<p>Definitely in favor of the gondola option, plus La Caille base station. The first road option really doesn't solve the problem; it just adds more busses to the existing mess. The second road option ruins the esthetics, solves only 3 out of 64 avalanche paths, has a bigger environmental impact, and they'd still have busses getting stuck on the road -- for more money than a gondola. The LaCaille solution, or some means to provide access for people from the South is necessary to support people coming from Sandy and areas South so they don't have to go all the way up to the gravel pit at BCC (which people won't do). One low cost solution for people from the South is in addition to bringing buses from the gravel pit, to bring more busses from the large and not totally utilized lot at 2000 and 9400.</p>	Suzanne Calhoun	Website
6184	<p>After further review I am no longer a fan of the gondola. I think it will be an eyesore to the beauty of the Wasatch and thus turn it into more of a fairgrounds of sorts. I also think the increased times will cause fewer people to use it on less congested days. I think expanding the road is a poor idea. There is tons of evidence I'd be happy to gather that shows increased road capacity leads to increased traffic. I think the best plan would be to enhance the public transport system and limit single use vehicles in the canyon via a toll or by shutting it down completely. By not allowing general public traffic in the canyon the city and resorts can focus on having high captivity vehicles transport employees and guests up the mountains. NO GONDOLA. NO WIDENING ROADS. YES TO ENHANCED BUS SYSTEMS!</p>	Ari Marks	Website
6185	<p>I believe that the gondola alternative is the most viable option for long-term usage. The need to build infrastructure in the canyon for additional lanes seems intrusive. The inability to use busses during times of avalanche threat also seems to make that option questionable. It seems to be an ideal fit for a canyon that will be impacted by development—which should be limited in order to preserve the beauty of little cottonwood canyon.</p>	Mark Clawson	Website
6186	<p>I support the enhanced bus system with no road widening option and the gondola option. I do not support the widening in Little Cottonwood for the peak period plan. Thinking long term-- expanding a road will not be enough for this growing valley; it will only act as a bandaid.</p>	Patrick Sullivan	Website
6187	<p>First, this is a solution that the ski resort businesses should pay for since it is a solution principally for their benefit. Second, as such Alternative 1 is the preference. It allows for allocation of expenses to the beneficiaries. Make the resort businesses pay for the buses and maintenance. Then set fares to cover operating expenses. This alternative allows for scaling and adaptable management plans. For example the number of buses can be expanded, if need be, to increase peak times capacity. During peak times there could be a salty toll charged against a mandatory vehicle toll pass (e.g. EZ-Pass) to encourage multiple riders per vehicle and reduce road overcrowding. Other adjustments would be possible as they are needed or discovered. Alternatives 2 and 3 are undesirable because of their impact on the canyons landscape, their net increase in noise and air pollution, and their allocation of expenses to non-users of the canyons. Let the users and beneficiaries pay the freight. And by all means let the citizens drive the decision rather than UTA and the Ski Resort companies. Don't let the fox manage the hen house.</p>	gary harding	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	Nowhere in this EIS is there any mention of the things presented by UDOT at the Cottonwood Heights city council meeting July 2, 2019.		
6188	<p>Take a look starting at around 29 minutes. Why is none of this information part of the EIS?? Why is there no mention of 35MPH on Wasatch Blvd.?</p> <p>https://www.youtube.com/watch?v=RlpLUJkpZXQ&feature=emb_title&fbclid=IwAR1m7eIWShmArGG62Bn3Yd_hZLKxeYcyzkDYownmhrSV3rDC0lDeUQKrs</p> <p>UDOT was supposed to do something that has not been done anywhere in the state. UDOT leadership committed to make Wasatch Blvd. a gateway facility and work with the city to make this happen utilizing the CH Wasatch Blvd. Master Plan as a starting point. There is no mention of the CH Wasatch Blvd. Master Plan, no mention of Wasatch Blvd. being a gateway, no mention of reducing speeds to 35 MPH anywhere in the Little Cottonwood Environmental Impact Statement alternatives.</p> <p>Mayor Peterson and Councilmember Mikell both indicated this was a new relationship between the city and UDOT and told the citizens to be patient because we will see something new and exciting in the next 3 to 5 years. Mayor Peterson indicated he contacted Carlos B. at UDOT and confirmed these things would happen.</p> <p>Shame on UDOT for renegeing on your commitments to the city and citizens of Cottonwood Heights.</p> <p>Vince:</p>	Lynne Kraus	Email
6189	<p>Attached are WFRC's comments to the Little Cottonwood Canyon (SR 210) Environmental Impact Statement Draft Alternative Development and Screening Report.</p> <p>Thank you for the opportunity. It has been a pleasure working on this project and I look forward to continuing to work with you and the EIS Team.</p> <p>Thank you, Ned</p>	Ned Hacker	Email
6190	The Gondola plan may have appeal for some. However, it has the same problems for seniors and individuals with compromised immune systems that buses have, only perhaps more so. Most older people (who represent a large percentage of the local population) can't stand for an entire ride up the canyon in a jam packed conveyance, and they are medically prohibited from being in such an environment if they are on immunity suppressant medication. (Brighton's 3-person-occupancy parking lot policy completely discriminated. Moreover, the boarding hassle would be over the top, and any breakdowns would likely cause disruption of considerable magnitude, including fear and anxiety of passengers. Finally, the degradation to the canyon environment, albeit perhaps of less duration than that of decades of automobile pollutants, could be significantly damaging to the water shed. I favor option 2, although it, too, could create water shed degradation. Also, if a lane for buses means preference to buses it would again be discrimination against seniors and those with compromised immune systems.	Victor Blanton	Website
6191	<p>As an avid climber and non-skier, I see Option 1 (adding buses only) as the only viable way forward. This canyon holds incredible value to many recreationists beyond those interested in accessing private businesses (Snowbird and Alta). Additionally, spending tax payer dollars to increase access to said private businesses does not seem ethical or appropriate for the Salt Lake community as a whole. Please consider the first option of only supplementing additional bus systems instead of altering the canyon and negatively impacting other outdoor communities and the environment.</p> <p>Thank you for taking comments. I stand tense awaiting the decision you will make that will affect the future of our beloved LCC.</p> <p>Best, Kim</p>	Kim Moran	Website
6192	I think the gondolas are the best option, and will also allow for the least amount of headache. There have been to many times where I have taken gotten stuck waiting for avalanche control at the mouth of the canyon	Zach Clawson	Website
6193	NO GONDOLA! This will just give the resorts more money, turn more of the backcountry across the street into "alta side country" and it will just increase the hype around the canyons. We need a much better bus or public transportation system. I like the "bus only" lane addition for peak hours/days. I think this would be the best option to decrease traffic and still get skiers and snowboarders up there efficiently. Again, BIG NO on the gondola. Let's keep Utah wild and not turn it into a Zermatt.	Alec Finke	Website
6194	Option one because it minimizes impact for roadside parking the rest of the year. It is also the least destructive option to the canyon. Option 2 could always be implemented later if option one is not enough. Option three will ruin the natural views from all locations in the canyon.	Mike Ramsey	Website
6195	<p>The current plans as laid out in this EIS seem to ignore the diverse user groups that utilize LCC on a year round basis. Instead is solely focused on how to get as many skiers up the hill, four months out of the year, as possible. The impact it will have on other users that enjoy the canyon all year around, seems to be ignored or relegated to "here's some parking".</p> <p>Widening the road OR installing a gondola will have a negative impact on me. It will have a negative impact on groups that utilize the canyon 365 day a year (climbers and hikers especially). In addition, it is a gross mismanagement of (my) taxpayer money to allocate funds to meet the needs of a single user group (skiers) and therefore are nothing more than \$400m driveways to Alta and Snowbird.</p> <p>Find a way to spend the money more equitably across users. Find a way to take into account ALL major users of the canyon (Climbers, Hikers, Bikers, Campers, Families) AND skiers. Find a way that isn't solely servicing the needs of those who can afford \$125/day per person for a lift ticket. Do better.</p> <p>For those reasons above (1) Fair to all users (2) Fair to all taxpayers -- the only viable option that you have presented is an increase of bus service using the new transportation hub near the mouth of BCC.</p>	Tim Kemple	Website
6196	So with the gondola there would be no additional accommodations for bikes and peds? Also concerning that the gondola would not make any stops, so people participating in all other activities going up the canyon would still have to drive? Why is the focus only on LCC and not BCC?	Keith Bateman	Website
6197	The gondola option seems to make the most sense rather than putting more busses in the canyon. From a cost and operational stand point it seems like the better long term option too to keep people moving up the canyon in most conditions. Also, it will make for a great ride rather than being stuck in a man made tunnel.	Corey Middleton	Website
6198	I am in favor of the Enhanced bus service because I think it will have the least environment impact. Little Cottonwood canyon has its own pure beauty and the gondola would take that away from the climbers and other people who enjoy this canyon. The resorts only own the resorts and we shouldn't have to change the whole canyon just to accommodate corporations. Anything but the Gondola	Jake Nelson	Website
6199	I am in favor of finding a better option (s) to help reduce the congestion in LCC during the winters. However, I am not a skier and I do not use the ski resorts. I am a hiker and snowshoer who spends a great deal of time up LCC during the winter months. After reviewing the three possible alternatives, I think the best options seem to be the first and third, though I probably would never use the Gondola since it only has off loading at the ski resorts. The second option seems good, but if it impacts trail heads and availability to some of the best trails (e.g. White and Red Pine).	Mary Keleher	Website
6200	Though reducing congestion and travel times are very important, priority should be given to maintaining the beauty, environment and natural resources that the canyon provides people and wildlife.	Ryan Griffiths	Website
6201	<p>The gondola is by far the best option! Nothing else even makes sense.</p> <p>Little Cottonwood Canyon EIS c/o HDR 2825 E. Cottonwood, Parkway Suite 200 Salt Lake city, UT 84121</p> <p>Dear Sirs, As general manager and sole representative of the owners of the Walker Gravel pit on SR 190 (Wasatch Blvd), which property is being considered as a site for a UDOT mobility hub, I would like some clarification included in the EIS.</p> <p>A considerable amount of planning by UDOT and associates went into a proposed parking structure or structures with the associated traffic patterns on our property. As mentioned in your evaluation, we have worked for many years with Cottonwood Heights City on our own site plan, which does not include public parking structures. Our site plans include parking calculated for the proposed uses and conveniently located to associated buildings with short walking distances. The number of planned parking stalls is calculated for expected need.</p> <p>UDOT's proposed parking structures and traffic flow layout is good for skiers, but a failure for the planned high-density, mixed-use development as outlined in the Wasatch Blvd Master Plan dated July 2019. Additionally, the use-days needed to alleviate skier congestion results in UDOT's parking structures being vacant seven out of twelve months of the year. Please include in the EIS a detailed explanation as to how large, vacant structures enhance the planned development economically and aesthetically.</p> <p>On the financial side, your draft had some generalities as to skiers' input into the economy. The resorts in Big and Little Cottonwood canyons are an international attraction, and contribute significantly to Utah's economy. The EIS should include an economic analysis of the planned corridor enhancements specific to skiers, including parking structures. The analysis should specify the source of funding, and include accountability to taxpayers for the expenditures.</p> <p>Sincerely, Douglas M. Shelby General Manager Walker Development LLC</p>	Douglas Shelby	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6202	<p>I appreciate UDOT undertaking this effort - the situation in the canyons has become a serious problem. My perspective: resort passholder >12 years in LCC/BCC and backcountry skier, hiker, climber. I was at Alta the day the avalanche pushed a car off the road and shut it down this season and didn't get back to the valley until 10:30 PM. Thank you for considering the following comments.</p> <p>1) This set of alternatives overlooks the simplest, by far least cost, least impact to the canyon solution available. This would be to build the mobility hubs proposed, dramatically increase the # of buses and improve the quality of experience, and in winter close both canyons to private vehicles that do not belong to residents of the canyons with strong enforcement. Watching the Alta toll clear after the avalanche this year was incredibly frustrating. There were many 2WD vehicles and even more AWD without snow tires that couldn't even make it up the ramp from Wildcat base to the main road once the slide was cleared. They slid all the way down the canyon. The avalanche on the road was rare, but the unprepared vehicles and drivers are typical. Even with a dedicated bus lane, it won't matter when someone in a rental car with all seasons slides across the road. Everyone will be stuck. Tolls don't solve this problem because a tourist in a rental car who only skis a few days a year won't be deterred by a toll. It would mostly impact locals who are more likely to have capable vehicles and winter driving experience.</p> <p>2) For any of these solutions, the quality of the bus experience must be much better. I have taken the ski bus. When not crowded it is OK, but when it is standing room only as is typical on weekends, especially at the end of the day, it is far from a world class resort experience. I think it is even dangerous. I stood next to an older couple one day last season who almost fell over several times when the bus went around the curves. Wet boots, holding skis and poles, tired at the end of the day. They were really scared. Parents with kids have their own challenges. I am in favor of buses replacing cars in the canyons, but the experience must be more convenient than driving. Given the gear one has to take up the mountain, and fatigue, each passenger needs a seat. This means limiting occupancy and increasing frequency. Buses should also be electric. This would be a great way to educate the public about one of the primary ways to improve Wasatch Front air quality - the inversion is painfully visible coming down the canyon. Also the elevation drop offers great regenerative braking saving maintenance and improving operating expenses.</p> <p>3) Please consider the needs of backcountry recreation. This is part of what makes the Wasatch so special. Buses could stop at designated trailheads upon passenger request (pull cable like normal city routes). This would further reduce traffic and parking congestion, and actually open up potential for excellent loop/through hikes and tours.</p> <p>4) Of the proposed solutions, I believe that none would improve travel time and skier experience as much as my suggestions #1&2 (increase/improve buses while prohibiting non-resident private vehicles), which has the added benefit of not costing a quarter to a half a billion dollars. Enhanced Bus without LCC capacity doesn't sufficiently address the hazard and delays posed by private vehicles. Enhanced Bus with LCC widening helps by providing designated lanes, but they could still be shut down by private vehicles. The Gondola potentially bypasses problems caused by private vehicles (in LCC only) but the problem often extends all the way to 6200S. In fact most of the longest uphill backups I've been getting into the canyon, and it starts to move once past the Y. In addition, the gondola requires a logistically complex double transfer: car to bus, bus to gondola. Not very convenient for families. All this said, if it must be one of these options, the enhanced bus with widening seems to offer the shortest time and best user experience. Still, I question why an easy solution that could be implemented with expanding existing service and enforcement rather than massive capital improvements isn't being considered, especially as tax revenue shortfalls begin to impact budgets.</p> <p>I think the addition of a gondola would be good, since it would create a redundancy. Usually one drive up and down S.R. 210, whether or not it is winter. The problems with congestion on the road is during peak periods of demand, in winter, during the ski season, when there is a snow storm. Increasingly, the road can get backed up even on weekdays. For many years people have been talking about adding a train for an alternate means up the canyon. I believe this option has been ruled out as too expensive, or perhaps infeasible due to lack of right-of-way. Furthermore, it might also be subject to avalanche safety like the road, whereas a gondola presumably would avoid exposure to avalanche hazards. I have even read that a gondola could be used for emergency medical evacuations, and even perhaps transportation of supplies for inns and lodges. There appear to be many options for parking lots and buses to provide access to the gondola. I wish I had time to consider all the details in the EIS, but the criteria for assessing which option or combination of options would be most effective would be how many skiers can be transported up to the ski resort in the least amount of time, while also allowing local traffic to be unrestricted with canyon traffic. The capital and operating costs of each option would then be factored in, so the best choice in my mind would be the option or combination of options would move more skiers to the resorts most quickly, while not obstructing local roadways, for the least cost. Costs to consumers will also be important. If the gondola is more expensive, and one can still drive to the resorts without fee, people may be reluctant to use the gondola. During normal conditions, it might be hard to get someone to take the gondola if the road is open. Still, I think the gondola is a good idea for redundancy. People come from around the country and overseas to ski in Little Cottonwood Canyon. After being in traffic for 3 hours to get into Little Cottonwood Canyon during a recent snow storm, a policeman drove slowly by in the opposite direction to say the road would be closing for an hour. I complained, and he responded by saying, "Well, it's snowing." Yes, just when everybody wants to go skiing. What a disappointment for so many people in idling cars, and for local residents who are unable to navigate the roads in their community. Many locals complain about rental cars without 4-wheel or all-wheel drive and snow tires. Since Utah and Salt Lake City promote travel to Salt Lake City airport for skiing in Utah, it would seem that rental car agencies could be persuaded to have cars available at reasonable cost which are appropriate for winter driving. Although I support the idea of adding a gondola, I do not think this should be an either/or question. In my opinion, S.R. 210 should have avalanche protection. It is a repeated failure that many police, avalanche safety and road maintenance personnel are working during storms, while skiers sit in their cars for hours on end, often in vain. This past winter, I had waited in my car for 3 1/2 hours to get to the canyon road. Thinking I was almost to the resorts, traffic came to a halt just short of Snowbird. Apparently an avalanche covered the road and partially buried a vehicle. After such a long wait, all the upbound vehicles were then told to turn around and leave the canyon! Not being able to evacuate medical emergencies because the road is closed because of avalanche or avalanche danger seems irresponsible. Having said that, when Alta and Snowbird are in inter-lodge, nobody is able to go outside, let alone drive on roadways. Perhaps the gondola would provide transportation during any snow storm. For that reason, once again I support the addition of a gondola. As to the potential widening of Wasatch Blvd, and the situation of various mobility hubs and buses to serve the gondola, I think that is a matter of mathematics, as in a traffic study by transportation specialists. However, I am in favor of improving trail head parking, and sanitary facilities. Increasingly cars overflow from parking lots onto the shoulders of the roadway. Without roadside improvements, the natural landscape will suffer abuse and contamination. In addition, I think a hiking trail system up the canyon would be a good idea. In other states and Canadian provinces, trail systems are developed and maintained with bridges, regrading, and other amenities, which can address proper care of the natural environment, and make for a more pleasant outdoor experience. Rather than choosing one solution to the problem, why not use a combination solutions. What are the objectives? Transport the most number of people, and goods, as quickly as possible to the ski resorts, and to the backcountry, while limiting impact on the local communities as the base of the canyon, for the least cost, including capital expense, operating and maintenance costs, and user fees. Widening S.R. 210 and adding busses and lanes does not seem prudent, given the comparative cost with the addition of a gondola, and the lack of assurance of travel during snow storms.</p>	David Eckels	Website
6203	<p>This is the best option!</p> <p>I think the addition of a gondola would be good, since it would create a redundancy. Usually one drive up and down S.R. 210, whether or not it is winter. The problems with congestion on the road is during peak periods of demand, in winter, during the ski season, when there is a snow storm. Increasingly, the road can get backed up even on weekdays. For many years people have been talking about adding a train for an alternate means up the canyon. I believe this option has been ruled out as too expensive, or perhaps infeasible due to lack of right-of-way. Furthermore, it might also be subject to avalanche safety like the road, whereas a gondola presumably would avoid exposure to avalanche hazards. I have even read that a gondola could be used for emergency medical evacuations, and even perhaps transportation of supplies for inns and lodges. There appear to be many options for parking lots and buses to provide access to the gondola. I wish I had time to consider all the details in the EIS, but the criteria for assessing which option or combination of options would be most effective would be how many skiers can be transported up to the ski resort in the least amount of time, while also allowing local traffic to be unrestricted with canyon traffic. The capital and operating costs of each option would then be factored in, so the best choice in my mind would be the option or combination of options would move more skiers to the resorts most quickly, while not obstructing local roadways, for the least cost. Costs to consumers will also be important. If the gondola is more expensive, and one can still drive to the resorts without fee, people may be reluctant to use the gondola. During normal conditions, it might be hard to get someone to take the gondola if the road is open. Still, I think the gondola is a good idea for redundancy. People come from around the country and overseas to ski in Little Cottonwood Canyon. After being in traffic for 3 hours to get into Little Cottonwood Canyon during a recent snow storm, a policeman drove slowly by in the opposite direction to say the road would be closing for an hour. I complained, and he responded by saying, "Well, it's snowing." Yes, just when everybody wants to go skiing. What a disappointment for so many people in idling cars, and for local residents who are unable to navigate the roads in their community. Many locals complain about rental cars without 4-wheel or all-wheel drive and snow tires. Since Utah and Salt Lake City promote travel to Salt Lake City airport for skiing in Utah, it would seem that rental car agencies could be persuaded to have cars available at reasonable cost which are appropriate for winter driving. Although I support the idea of adding a gondola, I do not think this should be an either/or question. In my opinion, S.R. 210 should have avalanche protection. 6204	<p>This is the best option!</p> <p>The population in Utah is exploding. Every year the drive up the canyons grows longer as more people flock to the outdoors. I am encouraged that UDOT has recognized this and is progressing with plans to efficiently transport people up Little Cottonwood Canyon. However, I am disappointed that a train was not one of the final three options included in the environmental study (EIS) for this proposal.</p> <p>All three options (more frequent bus service, dedicated bus lane or a gondola) have their merits, but they are all temporary Band-Aids. A train would be the only long term solution for the broader problems of traffic congestion and air quality on the Wasatch Front.</p> <p>None of the final options addresses these issues in their entirety. They all require traffic to converge on the canyon before they are actually used. This requires roads being widened, more parking structures, and continued hassle in the Cottonwood Heights neighborhoods.</p> <p>A train is a proven mode of mountain transport that would be the most efficient, the cleanest and most importantly – expandable. If UDOT is serious about solving our traffic and air issues, the train could easily be expanded to connect into the successful investments the state has already made into rail (Frontrunner and Trax)</p> <p>The train may have the highest initial investment, but unquestionably has the highest return on investment over a 40 year period. If we are serious about shaping our future right now, why don't we bite the bullet and invest in a long term solution instead of a short term Band-Aid.</p> <p>Whichever option is used. Access will still be needed at the trail heads for backcountry skiers or snowshoers. Places like the White Pine Trail head need to remain accessible.</p> <p>As a frequent user of the Cottonwood Canyons, I strongly support the idea of the gondola going up the canyon. I feel like it will be the most successful of the three concepts at reducing traffic and protecting our environment.</p>	David Vaughan	Website
6205	<p>Ryan Griffiths</p> <p>Proterra, the leader in developing and deploying battery electric buses in North America, would like to provide a technology update as a response to Section 3.1 "Bus Capacity and Technology Type" in Appendix D Draft Enhanced Bus Concepts https://littlecottonwoodeis.udot.utah.gov/wp-content/uploads/2020/06/LCC-EIS-Alternative-Screening-Report-2020-05-21_AppendixD.pdf. This section says "Although electric bus technology is rapidly advancing, electric bus batteries currently have both limited range and performance issues on steep grades. Further, when primary electric heaters are used in cold weather, the heaters drain the batteries, limiting the range the bus can travel before needing to charge. (Currently, most transit authorities heat any electric buses in their fleet using a diesel fuel heating system.) Because electric bus technology is still evolving, electric buses were eliminated from consideration when this report was written."</p> <p>Proterra has been building and delivering battery electric buses for the past 10 years and has developed a 5th generation Catalyst E2 Max electric bus with 660 kWh of energy storage that is designed to climb hills and operate in cold weather environments. Specs on this bus can be reviewed at the following link https://www.proterra.com/wp-content/uploads/2020/06/Proterra-Catalyst-40-ft-Spec-Sheet-June-2020.pdf. The DuoPower drivetrain has 550 peak horsepower and 338 continuous horsepower that will climb a maximum grade of 25%. The 660 kWh of energy provides an operating range of 221 miles to 329 miles on a single charge depending on a higher efficiency of 1.8 kWh/Mile or a lower efficiency of 2.7 kWh/Mile, depending on the operating conditions.</p> <p>Proterra has worked closely with both Park City Transit and UTA to help them develop their electric bus strategies and programs. Park City Transit initially deployed its first 6 Proterra buses in 2017 and has travelled over 1.2 million miles with these buses during this time. Since the time of the initial deployment of electric buses in Park City, electric bus technology has improved significantly in range, hill climb capability, interior heating and charging. Proterra buses have been engineered to use Onspot chains or other chain technology to provide additional traction on snowy roads, when needed. Bus cabin heating technology has also improved and while fuel-fired heaters are an option, they are not required to keep passengers and drivers warm while still meeting range requirements.</p> <p>In February 2019 Proterra brought a Catalyst bus with a DuoPower drivetrain to the Wasatch Front and climbed every canyon where UTA and Park City currently provide bus service to ski resorts to demonstrate that electric bus technology had matured to a level to meet or exceed performance of diesel buses in the canyons. Proterra drove a group of 15-20 representatives from UTA up Big Cottonwood Canyon, which has a peak grade of 10.1%, and maintained a minimum speed of 43.5 MPH at the peak grade going to Brighton Ski resort. The bus maintained a minimum speed of 27.1 MPH at the peak grade of 12.6% in Little Cottonwood Canyon. A video showing the performance and statistics of the bus going up each canyon can be seen at https://www.youtube.com/watch?v=V5JVKRw54.</p> <p>Proterra is currently building and delivering the buses that were tested in Utah in 2018. Proterra recently delivered 19 of these buses to Edmonton, Alberta and is scheduled to deliver a total of 40 buses to Edmonton by the end of 2020. Jackson, Wyoming is in the process of receiving 8 Proterra Catalyst E2 Max buses with DuoPower drivetrains that they will use to drive passengers to their ski resorts this winter.</p> <p>Proterra would be happy to bring a Catalyst E2 Max DuoPower demonstration bus to Utah again this winter to demonstrate how existing battery electric bus technology can meet all of the goals and requirements needed to improve transportation options in Little Cottonwood Canyon at the lowest cost and with the lowest impact on the environment. Electric buses currently meet the performance needs to climb the Cottonwood canyons and require the least amount of infrastructure upgrades to deliver this service.</p> <p>Proterra has received orders for over 1,000 buses and successfully delivered more than half of those, it would be unfortunate to not do a complete analysis on the current electric bus technology when making a decision on how to best provide transportation in the Wasatch Canyons. The technology that the report references may be available in the future is available now and deserves to be properly vetted. Both Salt Lake City Mayor Mendenhall and Salt Lake County Mayor Wilson as well as other local leaders are supportive of deploying electric bus technology to meet our region's transportation needs and improve air quality.</p> <p>I have lived in Salt Lake City my entire life and spend a significant amount of time running, hiking and skiing in our canyons and look forward to the chance to demonstrate how zero emission bus technology can best meet the transportation needs in our canyons right now. I would be happy to meet with any local stakeholders at any time to answer any questions about the feasibility of using electric buses to provide service in our canyons.</p>	Gus Gochnour	Website

6208	<p>In regards to the proposed construction on cottonwood canyon I am deeply opposed to the proposal to widen the road or add a gondola. The increased disruption of this pristine and cherished environment too great a cost for the supposed reward of the project. There are many other options to consider. Increased bus routes and added incentive to carpool are just a couple of those options. Utah should be examining ways to increase sustainable and environment protections not added pollution and environmental desecration. Please do not go forward with this proposal.</p>	Claire Muehleisen	Website
6210	<p>I think the gondola is a great option. Who needs more loud stinky buses, right?</p> <p>I support enhanced bus service with no road widening.</p>	Anthony Lyman	Website
6211	<p>We also need to preserve and expand existing back country trailhead parking options.</p> <p>No gondola.</p> <p>Chad Whittaker</p>	Chad Whittaker	Website
6212	<p>I support the Enhanced Bus Alternative (without roadway widening), as it would have the least impact on LCC climbing.</p>	Christopher Hilton	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6213	<p>1. I prefer the enhanced bus with roadway widening and snowshed alternative.</p> <p>2. Initially I thought I would prefer the gondola, however, when you need to ride a bus anyways I would much prefer to stay on the bus than to transfer to a gondola, it is a much more taxing journey to transfer.</p> <p>3. The snowsheds to me would hopefully solve much of the roadway closure hours of delays problems coming from avalanche danger, that's one of my biggest issues with the current situation. Also, the buses for me need to move faster than the stuck traffic and it sounds like the road expansion with an additional lane would do that. It is unacceptable for people to be stuck standing on the bus while it's stuck in traffic. UTA seemed to do an OK job last year getting the bus ahead of traffic with emergency vehicles but the dedicated lane seems like it would help.</p> <p>4. I ride the bus frequently. I think design changes to the buses themselves need to happen. The need to climb stairs makes carrying your skis cumbersome, I've personally seen many trips, falls, and drops involving the stairs. Also, the drive can be motion-sickness inducing and personally when you are forward-facing it is much more comfortable. More forward-facing seats would be ideal. Less standing would also be ideal.</p> <p>Thanks!</p>	Chris Hammock	Website
6214	Please be responsible in expansion of infrastructure. Many aspects of current plan are too invasive, cut slopes expanding way too much!	Lydia McCloskey	Website
6215	I support the gondola project over widening the road because it seems more cost effective and environmentally responsible.	Brenton Scobee	Website
6216	Keep our canyons natural. We don't need a gondola or any other of these things. Please don't tear up the natural beauty. That sounds much more polluting than dogs in the canyon	Noah Christensen	Website
6217	As these comments address and Environmental Impact Statement, it is concerning that environmental impacts have been identified as Level 2 criteria, rather part of Level 1 Criteria. Little Cottonwood Canyon is not only an important and sensitive watershed, but a unique natural environment. Both deserve preservation and protection. This unique and beautiful environment is why people visit this canyon. The alternative of enhanced bus service with no additional road capacity in LLC is far preferable than either enhanced bus service with roadway widening or Gondola. Both road widening or Gondola alternatives would irrevocably change the very character that makes this canyon so beloved. Ski Resorts and Areas should also take responsibility by running dedicated buses or subsidizing bus transportation to their destinations.	Amy Penechar	Website
6218	To whom it may concern, I am emailing in support of the Gondola option at the base of Little Cottonwood Canyon. As a resident of Utah for the past 20 yrs, this feels like the best long term solution to the transportation issue in our canyons. It is also the least evasive in terms of allowing transportation to continue throughout the construction process and will probably be the least impactful on local businesses. I feel that more busses in the canyon will only add to the problem and not let people enjoy the canyons for the beauty they hold. The snow shed/avalanche bunkers are not guaranteed to work in all the locations needed. In the end, I think the gondola also gives more options to connect even more ski areas in the future for a better experience similar to European countries who have already adopted them.	Corey Middleton	Email
6219	Thanks for your time, I think it would be amazing and less of an impact to have that gondola for our canyons and our environment	Shaun Sudbury	Website
6220	Option 1, using/increasing number of buses would be the preferred change, with the least negative impact on the area that hikers, climbers, and bikers enjoy far more days of the year than skiers utilizing the 2 private resorts. Please be mindful of the major impact widening the road and building a gondola would have, it would inevitably be the most destructive. Little Cottonwood Canyon is a beautiful place full of adventure for everyone, not just a road that caters to ski resort patrons. I would advocate for adding buses only, no construction on the road or for a gondola which would be devastating to hiking and biking trails, and rock climbing. Thank you.	Alex Johnson	Website
6221	I fully support the Enhanced Bus Option. I strongly oppose the Gondola proposal. The Gondolas would be an eyesore and would involve too great of an environmental impact with limited benefit. I also oppose the bus option with road widening. My primary concern with the road widening is the impact on climbing/bouldering areas in the canyon. The Enhanced Bus option should definitely be tried first and if that proves inadequate the other solutions could be looked at. I do believe the snow sheds are an absolute necessity.	Joel Zenger	Website
6222	I support the gondola project.	Rhonda Gowers	Website
6223	I would prefer to see the Gondola option to decrease the amount of traffic up the canyon and feel it would be a year round benefit to the canyon.	Gary Gowers	Email
6224	Please consider the Gondola as the preferred option to alleviate vehicle traffic up the canyon.	Gary Gowers	Website
6225	I support the gondola over widening the road and adding an extra lane. The gondola will be more cost effective, is better for the environment.	Hanna Vukojevic	Website
6226	I support the addition of the gondola over widening the road. It would be a neat attraction.	Kristine Scobee	Website
6227	I fully support the gondola. Great solution.	Chad Beus	Website
6228	I support the idea of building a gondola in Little Cottonwood to help ease the congestion.	Rhonda Gowers	Email
6229	<p>Hello, Please consider an ultimate solution that is based on common sense and a goal of making Cottonwood Heights a livable and enviable environment. Please don't sell out to developers and direction that is based on revenue. Here's the dream, which is total common sense and VERY achievable: -- Eliminate Ikon Passes on both Little and Big Cottonwood Canyon. -- Continuous bus service both express and multi stop from two major parking stations (gravel pit and 94th and Highland). -- Widen Canyon road and put in show sheds and gas ex on north side lanes -- NO WIDENING OF WASATCH BOULEVARD -- Vehicle # access limits based on vehicle count -- toll booth at Canyon exits to source for funds for Canyon maintenance. -- one time season passes available for locals. Without sounding rude, how can you consider anything but something like the concept above. Our current choices show a real lack of understanding of the situation, based on expansion and outdated theories.</p> <p>While many people think there are 3 alternatives for which UDOT is accepting public comment for, I need to point out that there are 2 separate alternatives specific for Wasatch - sadly both will widen Wasatch Blvd beyond what is absolutely necessary. The proposed alternatives for Wasatch regardless of which option is finally chosen to get you up the canyon can be found here: https://littlecottonwoodids.udot.utah.gov/wp-content/uploads/2020/05/10265_3_LCC_Public_Factsheets_Wasatch_Blvd_FIN_WEB-3.pdf There are 6 qualifying criteria at this level 2 that UDOT will use to determine which alternative fits best, these are found here: https://littlecottonwoodids.udot.utah.gov/wp-content/uploads/2020/05/10265_3_LCC_Public_Factsheets_Purpose_Screening_Process_FIN_WEB.pdf As for the 2 alternatives for Wasatch, it is our opinion that: Both Wasatch alternatives fail to even meet local and regional plan criteria, and as such they should both be disqualified and a new alternative should be drawn up. Both options go well past the prescribed 5 lane configuration as presented by the Cottonwood Heights Wasatch Master Plan, and even surpass the WFRRC regional plan of 5 lanes for this segment for Wasatch. How is that? UDOT is pushing the envelope when they call their "Five-lane alternative" by the use of the number 5. In fact there are 7 lanes in the configuration they present and they themselves have stated publicly that they would not be shy to utilize the shoulders as a traffic lane if traffic conditions should make it necessary. By that statement, even the Imbalanced alternative goes beyond the 5 lane maximum prescribed by the regional and local plans by paving 6 lanes of travel. This is an abusive and hardly needed expansion of a road that will increase capacity to levels in the year 2050 in excess of what is called by even UDOT Standards. It will become a barrier for cross traffic between the east and west communities. It will be so bad, and UDOT knows this, that they will require pedestrian bridges because it will be so dangerous to be found in the presence of this environment without 4000 pounds of steel surrounding your personal space. The amount of pavement will almost double the amount of storm water it will collect in rain and snow events regardless of the alternative chosen, it will increase noise pollution that will not only make it a less desirable place to live, but also affects wildlife along the foothills. The width and speed prescribed on both alternatives will also make it more likely that wildlife will collide with cars along this route at similar levels than seen at the segment of Wasatch near the Gravel Pit. Because ultimately the geometric dimensions will be necessarily even wider than at that location. As for safety, There are 13 intersecting points into Wasatch along the 2.2 miles of urban space. About half of all traffic that uses Wasatch enters or exists through one of these 13 points, of which 7 of them are not signalized. A multi-lane environment at 50 mph will increase the likelihood of side-impact to local users of the road. Impacts so severe that statistical data shows that people will have less than a 15% chance of survival. This is data that UDOT is aware of and continues to ignore through their persistent use of a 50 mph design speed. Attached below is some more basic information all forward thinking citizens are aware of: While many people think there are 3 alternatives for which UDOT is accepting public comment for, I need to point out that there are 2 separate alternatives specific for Wasatch - sadly both will widen Wasatch Blvd beyond what is absolutely necessary. The proposed alternatives for Wasatch regardless of which option is finally chosen to get you up the canyon can be found here: https://littlecottonwoodids.udot.utah.gov/wp-content/uploads/2020/05/10265_3_LCC_Public_Factsheets_Wasatch_Blvd_FIN_WEB-3.pdf There are 6 qualifying criteria at this level 2 that UDOT will use to determine which alternative fits best, these are found here: https://littlecottonwoodids.udot.utah.gov/wp-content/uploads/2020/05/10265_3_LCC_Public_Factsheets_Purpose_Screening_Process_FIN_WEB.pdf As for the 2 alternatives for Wasatch, it is our opinion that: Both Wasatch alternatives fail to even meet local and regional plan criteria, and as such they should both be disqualified and a new alternative should be drawn up. Both options go well past the prescribed 5 lane configuration as presented by the Cottonwood Heights Wasatch Master Plan, and even surpass the WFRRC regional plan of 5 lanes for this segment for Wasatch. How is that? UDOT is pushing the envelope when they call their "Five-lane alternative" by the use of the number 5. In fact there are 7 lanes in the configuration they present and they themselves have stated publicly that they would not be shy to utilize the shoulders as a traffic lane if traffic conditions should make it necessary. By that statement, even the Imbalanced alternative goes beyond the 5 lane maximum prescribed by the regional and local plans by paving 6 lanes of travel. This is an abusive and hardly needed expansion of a road that will increase capacity to levels in the year 2050 in excess of what is called by even UDOT Standards. It will become a barrier for cross traffic between the east and west communities. It will be so bad, and UDOT knows this, that they will require pedestrian bridges because it will be so dangerous to be found in the presence of this environment without 4000 pounds of steel surrounding your personal space. The amount of pavement will almost double the amount of storm water it will collect in rain and snow events regardless of the alternative chosen, it will increase noise pollution that will not only make it a less desirable place to live, but also affects wildlife along the foothills. The width and speed prescribed on both alternatives will also make it more likely that wildlife will collide with cars along this route at similar levels than seen at the segment of Wasatch near the Gravel Pit. Because ultimately the geometric dimensions will be necessarily even wider than at that location. As for safety, There are 13 intersecting points into Wasatch along the 2.2 miles of urban space. About half of all traffic that uses Wasatch enters or exists through one of these 13 points, of which 7 of them are not signalized. A multi-lane environment at 50 mph will increase the likelihood of side-impact to local users of the road. Impacts so severe that statistical data shows that people will have less than a 15% chance of survival. This is data that UDOT is aware of and continues to ignore through their persistent use of a 50 mph design speed.</p> <p>Thank you for some important reflection and consideration. 6230	<p>Enhanced bus is the only scenario that makes sense. No road widening. Once this path is taken. The road becomes a Freeway in a few years. Destroying the Canyon.</p> <p>Most Ski Resort Employees should be required to ride the Bus. UTA and the Resorts should sit down and workout a schedule that works for Skiers and Resort Employees. Resort Employees (1500 of them) are still driving in their cars. That is a lot of Cars. On Avalanche mitigation days they are called at five am and told to line up in the Canyon. This backs up traffic on the 10.4 days.</p> <p>The traffic problem in LCC is only 10.4 days for a few hours. It is reckless to consider destroying the Canyon for such a small problem. Especially when the Resort Employees are still driving.</p> <p>There is open rebellion in this Country about abuses of power. Getting rich people skiing faster is not a reason to destroy this beautiful Canyon. It belongs to All the people.</p>	Susie Albertson	Website
6231	More parking for bus stations, earlier bus schedule, NO GONDOLA. The reason I don't ride the bus is because there is never parking!!! All my friends say the same thing	Zach Shehabi	Website
6232	Leave LCC alone!!! We REALLY don't need more people in the canyons - let beautiful nature and fauna thrive on their own <3	Patricia Annoni	Website
6233	I am supportive of the gondola concept being considered as an effective, safe and environmentally friendly way to move individuals in the canyon.	Eric Isom	Website

6235	<p>Nicholas Gibbs July 10, 2020</p> <p>Utah Department of Transportation, Et. Al. Re: Little Cottonwood Canyon EIS 2018</p> <p>Identity of Commenter and an Observation I am 61 years old and a home owner in the Town of Alta. Before building our current home in 1977 my father, Peter Gibbs along with his brothers Edwin and Bill and their sister Mary Adele built the Peruvian Lodge and opened for guests in 1948. My family owned and operated the Peruvian Lodge until shortly before we built our current home in the town of Alta. I have spent my entire life driving up and down Little Cottonwood Canyon. Presently, I drive up and down Little Cottonwood Canyon very frequently, as do my wife and sons. I am an Alta season ski pass holder as are my wife and sons and I am intimately familiar with the traffic situation in the canyon year round.</p> <p>I believe that the existing road in Little Cottonwood Canyon is adequate 98% of the time. In fact it is significantly better than when I was a boy and through my 20's. I find it extremely uncommon to have major traffic jams in the canyon itself. Once in the Canyon the traffic seems to flow. Improving Wasatch Blvd and North Little Cottonwood Canyon Road so that busses can get ahead of any car traffic jams on Wasatch Blvd is vitally needed. Improving Wasatch Blvd is critical regardless of which of the three outlined options is selected.</p> <p>I do not support additional lanes in Little Cottonwood Canyon. While I believe that it is essential to give the busses some means to pass vehicles on Wasatch Blvd, I question the need of dedicated bus lanes in the Canyon. While the canyon road may be near its limit on the very few busiest days, it is adequate without substantial improvements if steps are taken that reduce the number of cars in the canyon.</p> <p>Below are 11 specific comments. Comment 1: The solution is more people in fewer vehicles. This includes more people using the bus system and incentivizing high occupancy in private vehicles.</p> <p>With respect to buses you can incentivize people to use them by a having a bus service that is frequent, reliable and inexpensive. Reliable service includes service that can bypass the worst of the traffic jams on Wasatch and North Little Cottonwood Road and get to the head of the line at the mouth of Little Cottonwood Canyon. Inexpensive is a relative term, and bus service needs to be inexpensive compared to other options. One means of making this occur is to put a price on driving private cars.</p> <p>The occupancy of cars can be increased by putting a toll on those who drive up the canyon. This also makes the bus look more attractive. A toll system should be automated like EZPass on the East Coast.</p> <p>Occupancy of cars will also increase if cars that are not carpools must pay to park. The pay-to- park scheme adopted by Solitude resort last year should in some form be adopted by Alta and Snowbird. There may be other means to get more people in fewer vehicles that should be explored. A "Busses Only" rule in effect for the first few hours of each day would reduce the number of cars. Please note that all of these steps, except building another lane or a bus lane between the mouth of Big Cottonwood and the mouth of Little Cottonwood, are very inexpensive compared to the options outlined in the EIS.</p> <p>Only after these steps have been taken and have been found to be wanting should UDOT consider an enhanced bus lane in the Canyon or an aerial tramway. Go for the low hanging fruit first before expensive "fixes" that may not be necessary if better bus service, tolling, charging for non-carpool parking and the like do not solve the problem.</p> <p>Comment 2: Stage some of the improvement and be flexible. UDOT should make some of the improvement before others. For example, UDOT could improve Wasatch Blvd and North Little Cottonwood Road, implement tolling and/or fees based parking, then wait and see how much the traffic is reduced. UDOT can then analyze how well the improved system works before the massive expenditures on other options such as the aerial tram or additional lanes in the Canyon.</p> <p>Comment 3: The goal of getting 30% of the cars off the road by 2050 is far too low. This is an absurdly low goal in light of the amount of the proposed expenditures under any of the options.</p> <p>The tools discussed above could get 30% or more cars off the road in short order. These include 1) reliable, frequent and inexpensive bus service 2) bus service that can bypass any traffic jam on Wasatch Blvd. and North Little Cottonwood Road, 3) tolls so that there is a cost to taking an automobile up the canyon, and 4) fees to park at the resorts if the car is not a carpool (as Solitude resort implemented last year). Some combination of the use of these tools could significantly reduce the number of vehicles in the canyon. As a boy and young man I rode the bus every weekend to and from Alta. It was a round trip from the Olympus Hills Shopping Mall to the Gold Miner's daughter and it was cheap, convenient and easy.</p> <p>Comment 4: Intermodal hubs and parking structures are a crucial step to get more people out of their cars and into busses. In addition to the two planned hubs, consider (re)purchasing the large no-man's-land between Olympus Hills Mall and I-215 and adding 39th south to the possible parking areas. The existing park and ride at 39th south for UTA could be expanded if UDOT (or the County?) staging area for snow plows were moved and the park and ride tripled in size.</p> <p>Comment 5: Expansion of Wasatch Blvd and North Little Cottonwood Road. The residents in this area are concerned about this corridor becoming a highway and are urging that it be kept as a two lane "street" and not be a road. Efforts to accommodate the residents in this area should be made, but it is absolutely essential that at a minimum a south bound bus lane be constructed. The SaveNotPay group seems to recognize this in their literature. To reduce the "highway feel" in this area consider lowering the speed limit on North Little Cottonwood Road from 50 to 40 mph. It is already 40 in the Canyon and 40 as northbound cars approach Wasatch. Make it consistent. And while taking what action you can to appease the people who have chosen to live by the road to the ski resorts, expand Wasatch Blvd and North Little Cottonwood Road.</p> <p>Comment 6: Snow sheds do not appear to be worth it. An expenditure in the range of \$100 million dollars for snow sheds increases the likelihood that skiers will have better access to the ski resorts for about 5 days each year. Even that is no guarantee. Some years there are no major avalanches so the sheds are not needed. Other years the slides are plentiful, but the snow sheds do not guarantee that there will be resort access. In the 2019/2020 winter the sheds as outlined in the EIS would have protected the road from only 40% of the slides, so resort access would still have been reduced for 2 or 3 days anyway.</p> <p>Comment 7: The EIS fails to adequately evaluate or consider the impact of charging a toll to drive up the canyon. If a goal of the project is to reduce the number of cars in the canyon, tolling is a very important tool that should be implemented. Tolling is one of the factors that makes the bus seem like a better deal. The EIS should not gloss over this option but include realistic plans to implement tolls including an automated system like EZPass on the East Coast.</p> <p>Comment 8: Charging for parking. The EIS does not adequately consider how charging for parking would reduce the number of cars in the canyon. Charging for parking tends to incentivize people to use the bus and incentivize car pooling. While it is true that the parking lots at the ski resorts are not under the control of UDOT, UDOT could work with the resorts to implement fee based parking.</p> <p>Comment 9: UDOT must consider the impact of traffic regulations as part of the EIS. Traffic regulations are a means of solving some of the congestion problems and need to be considered in the EIS in addition to the focus on building infrastructure. The issue of road side parking can be used to illustrate this point.</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Nicholas Gibbs	Website
6236	As a professional rock climber and competitive climbing coach I use the lower canyon quite often throughout the year but mostly during spring and fall to rock climb, take athletes out to rock climb, as well as explore new areas for development for the rock climbing community. I would love to see parking lots added as mentioned in the proposal but nothing further as all other options affect the climbing areas that are just off the road such as secret garden, 5 mile, and cabbage patch.	Palmer Larsen	Website
6237	I support the gondola solution. Much more environmentally friendly and a more long-term, sustainable option for traffic control. Also, improves safety! Way less risk of car accidents in the canyon and makes it easier for folks who aren't comfortable driving in snow / do not have the right tires or vehicles to access alternative transportation. Thanks!	Emily Allen	Website
6238	I am in favor of increased bus service without widening the canyon	Traci Salisbury	Website
6239	I understand the 3 different options for transportation up Little Cottonwood Canyon. I strongly believe that the Gondola option is the best solution. It is environmental sensitive and the best solution for the transportation problems with the existing canyon.	Lyle Beecher	Website
6240	Seems like the best way to keep the traffic to a minimum in such a beautiful canyon.	Scott Morrill	Website
6241	Hey, I think the gondola seems like a great idea. I think it is a better alternative to widening the street and having more buses. The gondola will work better in the avalanches that happen up there in the mountains. Plus it should be better for traffic to not have everyone driving up the canyon. I really consider the gondola to be a great option and I support it.	Cecilia Black	Email
6242	After studying the three options for transportation up Little Cottonwood Canyon, I support the Gondola solution. It makes the most sense - financially and environmentally. Please consider my opinion. Thank you. I am writing in support of the enhanced bus option with lane widening. This is the superior option that benefits a majority of users of Little Cottonwood, while also reducing carbon and pollution emissions the most. I work professionally as a climate and energy analyst, and did an analysis showing that this option would lead to the lowest carbon footprint of the project. I'm happy to share upon request. The enhanced busing option does too little to fix the problem, and the gondola is inefficient and greatly increase carbon emissions. It's no secret that Utah's canyons loved to death. I have sat in infuriating amounts of traffic, waited for late and overcrowded buses, and had close calls squished between cars and bikers, just to go ski or hike. But to see environmental protection used to greenwash preferred transit plans frustrates me more than any late arrival or near accident.	Lori Beecher	Website
6243	One would expect climate change to be discussed first and foremost given the ostensible environmentalism from both parties. Rising temperatures and alteration of seasonal weather patterns will reduce the amount of snow that falls each season. Less snow will disrupt the ecosystems, businesses, and communities dependent on that snow melting. All groups could certainly agree that limiting fossil fuel emissions and inversion causing-pollution should be a priority. A quick look at the carbon emissions from the proposed plans reveals the climate-friendliest option to be a lane widening and more buses. The gondola would have 5 times the emissions per winter than either busing option, and the lane widening is the only option that could reduce congestion and make being in a bus a better option than being in a car. We need to consider more than just emissions though. We have to consider how we can keep a diversity of interests able to enjoy the canyons many uses safely. The lane widening gives space for cyclists, hikers, and climbers to travel safely along the road. The gondola only benefits the resort-goer, and the status quo plus more buses benefits no one. The lack of discussion of these issues shows how each camp is just pushing their own interests and hobbies. Thank you for your time. I urge you to consider the climate in your decision making, as well as equitably supporting the diversity of uses of Little Cottonwood Canyon.	ERIK OLSON	Website

6244	<p>Start with the simplest solution, #1, and be SERIOUS about it. It will still be expensive. It will take time to educate and encourage we the public to get out of our cars. We will feel aggravated at the idea of paying a toll, but those dollars would put some of the burden directly on users rather than general tax dollars. Include shuttle size busses in the plan, not just ski bus. Remember that many user are year round hikers, not just skiers. I predict that it will be stressful the first few times I realize that I can't just jump in the car, drive to a trailhead, and park myself. If, on the other hand, that process is convenient and only 20 minutes longer than it would have been to drive my own car, I am dropped and picked up right near the trail, I don't have to worry about driving, parking, and traffic, then the trade off becomes well worth learning the change. Come up with an annual pass system like Millicreek immediately. Tie the cost to the number of people you expect to transport in your vehicle. Reward pass holders carrying the appropriate number of passengers with quick transit through the fee station. Design the busses and shuttles to carry typical hiker gear as well as ski gear. Bathrooms at trail heads. Educate politely and frequently about how to use this gorgeous nearby canyon in ways that reduce impacts. You can do it without turning the canyon into a many lane thoroughfare and without the expensive elaborate gondola. It requires that you accept the challenge of working with actual people instead of just pavement, vehicles, and buildings. THANKS for taking the time to consider this suggestion and hopefully taking the time to try the least impactive solution first.</p>	hazel coffman	Website
6245	<p>During numerous hearings I attended concerning proposals for Wasatch Blvd., things like a two lane "boulevard like" road, traffic calming amendments intended to produce a 35 MPH speed limit, bucolic borders containing multi-use pedestrian/bikeway paths. etc.</p> <p>The choices now presented for comment appear to present high speed multi lane alternatives that end up going to nowhere. Wasatch Blvd. as prosed will be a multi lane high speed highway ending at a two lane road up the canyon (or the two lane extended Wasatch Blvd. to Sandy and Draper).</p> <p>I am in favor of making Wasatch Blvd./Route 210 between Bengal Blvd. and Little Cottonwood Rd. (Rt. 209) look like Wasatch Blvd. currently looks south of Little Cottonwood Rd.</p> <p>I favor Alternative # 1 with Wasatch Blvd. being 3 lanes - a single lane in each direction with a reversible bus lane. In no way do want to see Wasatch Blvd. be a 5 lane high speed highway.</p>	Louise Jacobs	Website
6246	<p>Best option available!!</p>	Kandi Morrill	Website
6247	<p>Concerning Little Cottonwood EIS: Having grown up in Slat Lake City the beauty of the Wasatch is something I could experience because it was left in a pristine state by previous stewards. I am thankful for this.</p> <p>The following is my response/assessment of the three alternatives for the Little Cottonwood EIS. With regards to alternative three, the gondola would be an option I cannot consider.</p> <p>Since 30% of canyon use is resort related, the gondola would be nonessential for the remaining 70% of dispersed use visitors. Given the environmental, wildlife and watershed risks of such a project to reduce congestion for those going to resorts I would consider this a high cost performance option.</p> <p>Concerning alternative two, the promotion of increased bus use would be an advantage. However, I do not support the building of additional snowsheds, this has an aesthetically and visually disturbing presence in the landscape and the minuscule gains of fewer road closures per winter season hardly justify the price tag. The damage and alterations of our watershed quality and environmental disruption from additional construction is something I object to. This is a high cost performance alternative.</p> <p>My support rests with alternative one since, do no harm is my first priority. I support this option with no additional road or vehicle capacity. The promotion of increased bus ridership must be a more emphasized part of the solution. This has the least environmental, wildlife and watershed damage of the three options. As stewards of the Wasatch we ought to first ask how we can encourage behavioral change which has been of little consideration among the high stake financial gains to be made from the complete commercialization of one of our most valued resources. Carpool incentives, occupancy based tolls for the whole canyon and educational campaigns, these are the lowest cost performance alternatives. More road capacity will simply lead to more congestion.</p>	James McCloskey	Website
6248	<p>You need to consider the private La Caille station option and reevaluate it. That is the smartest solution and is the only way I and other locals will get out of our cars.</p>	John Flanagan	Website
6249	<p>This would be an amazing way to get people up and down this beautiful canyon.</p>	Kamryn Alvey	Website
6250	<p>The gondola option is preferred but not in its current proposed form. There are a few major red flags that needs to be addressed before approval or implementation. I will not be addressing the bus options as those are highly unfavorable for many reasons; increased bus traffic, bigger footprint in canyon, etc.</p> <p>Assumption for all problems listed below are based on today's traffic which is only going to be exponentially worse in 2050 which is the assumption for the figures listed in the slides.</p> <p>Problems: 1. Gondola is only accessible by bus via Mobility Hub.</p> <p>A: This creates a huge traffic jam all around the Mobility Hub. All major and side roads will be heavily congested with vehicles trying to access this location. Wasatch is a mess on a ski day already, now the proposed suggestion moves all traffic to one area. This option is similar to if the airport only let UTA bus traffic in the airport terminals. Now all traffic has to merge.</p> <p>B: Vehicles with the destination of the Mobility Hub must now bypass the Lower Cottonwood Canyon (LCC), (If headed Northbound Highland/Wasatch etc.) and add to the Big Cottonwood Canyon Traffic (BCC) in order to reach the Mobility Hub. Once they reach the Mobility Hub they get on a bus only to be in traffic headed southbound towards LCC, essentially doubling the amount of traffic on the road, doubling congestion and time and impeding access to BCC.</p> <p>2. Gondola does not improve closure times due to avalanche.</p> <p>A: If the canyon is closed due to avalanche pre-resort opening, now all vehicles must drive to the Mobility Hub, take a bus, Get on Gondola (see problem 1A,1B). This includes employees of the resorts and support staff.</p> <p>1. Do employees and support staff get priority boarding on Gondola? 2. How much seating can you accommodate at the Mobility Hub when it's a powder day and the Gondola is the only route up the canyon due to avalanche closure? 3. The Gondola is a slow option, on a ski day with an avalanche closing the canyon, people will be waiting hours to not only find parking at the Mobility Hub, but for the bus and to get on the Gondola and up the Canyon.</p> <p>There will be thousands of people trying to queue. Also have you ever been in a long line on a powder day? Unfriendly and anxious would be two words to describe it.</p> <p>B: The Gondola alone is not a sufficient means of transportation for the quantity of people that will use the canyon if an avalanche closes the canyon. 1. If there are freezing temperatures, high wind, and heavy snow, will the Gondola continue to operate? 2. How will thousands of people leave the resorts if that occurs? 3. Can the resorts accommodate that many stranded people while inter-lodge is in effect? 4. In reference to the meeting, it was mentioned that this was out of scope, but this should be a part of the scope. What is the backup plan if the resorts can't accommodate all the thousands of people now stranded due to Gondola and road closure?</p> <p>3: Gondola does not include Snow Sheds</p> <p>A: See problems 1A, 1B, 2A, 2B.</p> <p>B: It was mentioned in the meeting that the cost for the Gondola and Snow Sheds is too cost prohibitive. Do not implement a solution that does not address all the problems because cost is an issue. Do the project right, one time. See I-15 in Lehi as an example. How many years has that area been under construction due to new construction to alleviate traffic jams? Or Bangerter Highway. That highway has been torn apart and public domain has been implemented just to widen it. Build it right, the first and only time.</p> <p>Opinion: If cost is too high, then wait and procure the budget. Don't implement half a solution which moves the traffic problem somewhere else.</p> <p>Recommendations: Snow sheds Gondola parking and drop-off Single Occupant Vehicle Restrictions: Do not restrict Single Occupant Vehicles. This excludes a large number of outdoors enthusiasts who do not have someone to accompany them. Everyone should be able to enjoy the canyon without being forced to ride a bus or a shared ride. Encourage shared rides, encourage bus use. Do not restrict single occupant vehicles.</p> <p>If a toll is necessary for single occupant vehicles, then treat it like the HOV lanes on the freeway with the Express pass. DO NOT RESTRICT SINGLE OCCUPANT VEHICLES.</p>	Matt Taylor	Website
6251	<p>The gondola solution is the only one that will actually fix the problem. While it may be unsightly, emissions will ultimately be greatly reduced. I encourage moving forward with the gondola plan.</p>	Will Hoag	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	<p>Preliminary Observations:</p> <p>Use of Little Cottonwood Canyon (LCC) is not going to go down in future years—which the draft EIS acknowledges. As the population of the State continues to increase, and as travel here from elsewhere continues to increase for skiing as well as other outdoor activities in all seasons, use of the canyon will continue to increase.</p> <p>There is a practical limit to how many vehicles can be accommodated at the top of LCC, and we are approaching (and perhaps at times exceed) that limit now. Over the medium and long term, it is imperative to find an effective alternative to a large share of the private vehicle use during high-demand time periods and to preserve the canyon as much as possible.</p> <p>1. Widening Wasatch Boulevard to four lanes between Bengal Boulevard and Little Cottonwood Canyon Road</p> <p>Widening Wasatch Boulevard from two lanes to four lanes between Bengal Blvd. and the "T" intersection where Wasatch separates from North Little Cottonwood Road will, by itself, do nothing to solve any traffic problem, whether in the canyon or on Wasatch Blvd. As it is now, the two lanes coming south from Fort Union merge into one southbound lane just south of the light at Bengal Blvd. On heavy ski use days, particularly weekend and holiday and other heavy skiing days, a traffic jam from that merge point will extend back on Wasatch much of the way to the light at 6200 South. The one-lane traffic then crawls the rest of the way on Wasatch and onto North Little Cottonwood Canyon Road, and thence up the canyon.</p> <p>The only effect of widening Wasatch to four lanes (two southbound) from the light at Bengal to the intersection with North Little Cottonwood Canyon Road would be to move the location of the point where two southbound lanes merge into one lane, which causes the initial traffic jam, south about 13 blocks or so to the North Little Cottonwood Canyon Road intersection. Then on the heavy use days there would be two lanes of jammed southbound traffic along Wasatch from that point extending back north instead of one lane of jammed traffic. There would be no effect on the one-lane congestion or jam from that point up into the canyon.</p> <p>Nor would widening that portion of Wasatch have any significant positive effect on commuter traffic—again for the reason that Wasatch Boulevard south of the intersection with North Little Cottonwood Canyon Road is only one lane each way. For the southbound traffic during evening rush hour, the two southbound lanes would have to merge into one southbound lane at that intersection. Virtually all the evening commuter traffic turns right at that intersection to continue south on Wasatch. Northbound traffic south of the intersection during morning rush hour would still be one lane up to the intersection, and the additional northbound lane between the intersection and Bengal Blvd. (where the road widens to two lanes now) would make little difference. The scope of the project doesn't even address Wasatch Boulevard south of the North Little Cottonwood Road intersection.</p> <p>There is no proposal on the table or in the report to widen North Little Cottonwood Canyon from two lanes to four lanes up to the intersection with Little Cottonwood Canyon Road, and then to widen the road to four lanes all the way up the canyon. Indeed, as a practical matter, that would be very difficult. (One of the "enhanced" bus proposals would add a shoulder lane for buses in peak periods but nothing for ordinary vehicle traffic.)</p> <p>For these reasons, widening Wasatch Boulevard to four lanes in the segment between Bengal Blvd. and the intersection with North Little Cottonwood Canyon Road will do nothing to alleviate the traffic problems. Unless widening that segment can directly facilitate and serve a major upgrade in non-vehicle transportation in the canyon (discussed below), it would be essentially a waste of millions of dollars of taxpayer money. The "public input" meetings held months ago to discuss ideas or possible proposals for how a widened road would be decorated, etc., were, frankly, little more than a frustrating distraction and were of essentially zero relevance to the fundamental problems. It appears that the only real beneficiary of those meetings was the highly-paid contract consulting firm from out of state that conducted the meetings.</p> <p>2. Neither of the "enhanced bus" alternatives as proposed in the report adequately address the problems. Under either of the "enhanced bus" alternatives in the report, less than one-third of the vehicle traffic in LCC would be replaced by buses—and that's if everything goes right and people decide to behave in the way UDOT hopes they will. Particularly over the medium and long term, reducing vehicle traffic during peak periods by less than a third is inadequate. Moreover, under the circumstances, it is questionable that the public will behave as desired.</p> <p>The enhanced bus proposals depend on proposed "mobility hubs" at the gravel pit north of Big Cottonwood Canyon Road and in the area of Highland Drive and 9400 South. These are both a considerable distance from the entrance to LCC. Taking a bus from either of these points means being stuck in the heavy traffic along either Wasatch Boulevard southbound or 9400 South eastbound during the peak periods (and that remains true even if Wasatch is widened between Bengal and North Little Cottonwood Canyon Road). There is simply no escape for the buses. If one has to sit in traffic, it is generally much more pleasant to do so with friends in one's own vehicle rather than in a crowded bus with a bunch of strangers, and having to haul your gear from the car to the bus and stow it on the bus.</p>		
6254	<p>Adding the bus-only shoulder lane up the canyon would add some incentive to take the bus because the bus (presumably) can make the trip up the canyon faster. But the question is whether that will provide enough benefit for enough people to make it worth it.</p> <p>Further, one bus from each "hub" every 6 minutes— 10 buses per hour from each—likely will not be adequate over time. If one of the two enhanced bus options is chosen, there likely will need to be more buses and more frequent departure times.</p> <p>The buses also add a lot of noise and diesel exhaust to the canyon and the canyon traffic. This is a significant environmental downside.</p> <p>3. Aerial transit has much greater potential benefit and promise</p> <p>The Aerial Transit Study (ATS) analyzed several possibilities, but at the same time admits its limitations and acknowledges that it does not address some key elements. Nevertheless, the ATS option appears to have much greater potential than either of the "enhanced bus" options.</p> <p>The situation we face in Little Cottonwood Canyon is in many ways analogous to the situation in Zermatt, Switzerland, located at the head of the canyon below the Matterhorn and other world-famous peaks. Zermatt is, of course, one of the great ski and summer mountain sport areas of the world. The ski capacity there, and the numbers of users/visitors and associated transportation demand, substantially exceeds Snowbird and Alta put together.</p> <p>The main transportation line from Zermatt up the mountain to Furi, and then to Schwarzsee and Trockener Steg, is a cable car system (that we think would be classified as a 1S system in the ATS study) that is extraordinarily efficient, safe, and effective. Each cable car seats 6, and there are racks on the outside for skis. One cable car leaves about every 12 seconds, which yields a capacity to move up to 72 people per minute, or up to about 4,300 per hour. Passengers change to a second line at Furi, a seamless process requiring walking a few yards, and take a second line that goes through Schwarzsee and up to Trockener Steg. The whole system operates automatically, without the need for an operator in a large tram, and with the passengers doing all for themselves quickly and efficiently.</p> <p>In the context of LCC, it would seem logical to run such a line from near the junction of Little Cottonwood Road and North Little Cottonwood Road (Routes 209 and 210) to a point near the Tanners Flat campground (a trail could be constructed from there to the trail to White Pine and Red Pine Lakes for hikers), then a second line from Tanners Flat to Snowbird, and a third from Snowbird to Alta. It is the case, as the ATS study point out, that more towers would be required than for a 3S system, but the towers are smaller, shorter, and easier and to construct, and have a considerably smaller footprint than the large towers required for a 3S system. The Zermatt-Furi-Trockener Steg line has an outstanding safety record, and has been most satisfactory in the winter environment above Zermatt (including the winds). We would strongly urge studying this system, and recommend that UDOT consult with its operator, Zermatt Bergbahnen AG. (Schluhmattstrasse 28, 3920 Zermatt, Switzerland; phone: +41 27 966 01 01)</p> <p>In September 2018, Zermatt Bergbahnen also began operation of a new 3S system between Trockener Steg and Klein Matterhorn with cabins that seat 28 each and with a capacity to move about 2,000 per hour. (See https://www.matterhornchalets.com/2019/05/08/3s-matterhorn-gliacier-ride-zermatt/)</p> <p>We believe that if such a cable car system such as the one recommended here and associated parking facilities were available, thousands of skiers and other users of the canyon would happily avail themselves of it. Travel up the canyon likely would be faster, and certainly would be more relaxing and provide even better scenic views.</p> <p>A cable car system such as the one recommended here would necessarily require construction of a parking structure at or near the beginning station. The logical place for such a structure would be on the east side of North Little Cottonwood Canyon Road near the current Little Cottonwood parking lot, building the structure into the mountainside and designing it in a way to incorporate it into the topography insofar as possible. We are aware of the numerous legal issues arising from Federal property ownership, permitting requirements, and other matters involved. However, solving these issues is unavoidably necessary to any medium-and long-term solution to the problems that any of the proposals are designed to address.</p> <p>Indeed, even with the enhanced bus alternatives, we believe that it will prove necessary to build such a structure, or one similar in concept to it, in any event. Further, widening both Wasatch Boulevard and Little Cottonwood Road for the purpose of facilitating more efficient private car travel to such a structure more efficiently would appear to make some sense.</p> <p>We believe that construction of a gondola system and associated facilities recommended here should not wait decades. Our traffic problems in the canyon are acute now. Once decisions are made, we believe financing and design should be pursued without unneeded delay.</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Geoffrey and Karen Heath	Website
6255	<p>To whom it may concern,</p> <p>This email is in regards to my support of the proposed gondola over widening the road and adding an extra lane. The gondola would be much more cost effective and would be better for the environment.</p> <p>Sincerely...Scott Morrill</p>	Scott Morrill	Email
6256	<p>I support the gondola, and so do all people that love nature and our beautiful state. Those who do not support it love car exhaust and dripping transmission fluid. That canyon is gorgeous as is! I have spent hundreds of hours there hiking and enjoying many other activities. I would be repulsed, disgusted, and shocked on levels inexplicable in our language to see UDOT bring in the bulldozers to destroy for the sake of more cars. Please, please do what is right!! Build the gondola!</p>	David Carlson	Website
6257	<p>I prefer the enhanced bus service with no roadway widening because it would have the least impact on rock climbing and hiking in the canyon.</p>	Jacob Allen	Website
6258	<p>Please remember this area is used for more than just skiing when the decision is made on how to best proceed. I am in favor of more buses. The other two options will negatively effect climbing areas, which are also a popular destination in the canyon and will also create more human impact thus removing more of the beauty of the naturally area.</p>	Timothy Walton	Website
6259	<p>Based on my review of the alternatives and the report, the gondola is an excellent option. It is much better than expanding the roadway in Little Cottonwood Canyon.</p>	Steve Mecham	Website
6260	<p>I support the Gondola. Forward thinking, least environmental impact</p> <p>To Whom it concerns:</p>	Nick Kostis	Website
6261	<p>I would like to submit my thoughts concerning the Options of relieving the traffic issues up Little Cottonwood Canyon. I do not feel just adding buses will solve any of the issues that plague that canyon. Also the addition of a new dedicated bus lane would be extremely expensive and damage the environment of the canyon. The other option of adding a Gondola is the most sound option. It would maintain the environment of the canyon best and would be more cost effective than the added bus lane option. It would handle the issues concerning avalanches by far better than more buses up the canyon. It would eliminate the need for obtrusive concrete Avalanche Sheds (that are very risky where to place) and provide better year round access to our wonderful mountains. I can just image the picturesque and relaxing ride a gondola would provide up the canyon.</p> <p>Thanks for your consideration with this matter.</p> <p>Lyle</p>	Lyle Beecher	Email

6262	I think the Gondola Plus La Caille Base Station is the best solution! It is the best for skiers, for visitors, for those who work in the canyon and for those who live in the canyon.	Arne Aune	Website
6263	I would like to add/ change my original feedback to largely support added busses but say NO TO ADDED LANES ON WASATCH BOULEVARD- which is my backyard. We pay top dollar to live here, it is a safe, residential area where we can walk and run on Wasatch Boulevard - one of my favorite places to run and bike actually. It cannot and should not be turned into a highway, this entire side of the Wasatch stands to LOSE from this happening. We cannot look to ruining an area for years because of heavy traffic for a handful of days. Why can't we consider electric trains or actual SUSTAINABLE options for growth? Trains would be quiet, potentially underground, move mass amounts of people and be sustainable to the growth without ruining the environment for years to come- forever. Can we please consider this? Please DO NOT DEVELOP MORE LANES ON WASATCH!!!!	Shandi Kano	Website
6264	The option for more busses is way better rather than affecting the whole climbing community for Alta and Snowbird which operate mainly half of the year	Brandon Tiev	Website
6265	I like the gondola option as it seems like the greener option that would preserve the natural beauty of the canyon.	Rachel Forrest	Website
6266	Despite UDOT's general good intentions, this LCC EIS has to be one of the most misguided documents to ever be published. The EIS reads like a business plan for 2 for-profit ski resorts rather than an objective range of solutions to solve the traffic problem in LCC, a canyon for the enjoyment of all Utahns and tourists, skiers and non-skiers alike. The proposed gondola solution along with the widening of Wasatch Blvd is an absolute joke and a prime example of Socializing Costs while Privatizing Profits. The problem is traffic yet UDOT seems to be focused on thru-put (how to get the most people up the canyon to the 2 for-profit resorts in the shortest amount of time). By their own research and admission UDOT says the average vehicle only carries 1.6 people. As we have more recently seen with the wearing of masks, hoping, wishing and/or praying for compliance or people's better angels to prevail is nonsense. The proximate cause of LCC's traffic problem are the resorts (Alta, Snowbird) themselves. Consolidation in the industry and the explosion of multi-resort season passes are the two driving factors. 20 years ago season passes to single resorts had a break-even of 23 ski days. Now with per day adult ticket prices approaching \$200, the break-even on Kon and Epic passes is around 6-9 days. No wonder more people are using LCC. And with the "no friends on a powder day" attitude of skiers as evidenced by the 1.6 occupancy per vehicle...voila, there's your problem. We don't need expensive and lengthy studies, hundred million dollar gondola systems or a wider Wasatch Blvd leading into the limited space that is LCC. Common sense can and should guide our way. First the 2 resorts in LCC as well as their skiing customers need to bear the cost and burden of the solution. That could take the form of mandated charging for parking, tiered tolling in LCC depending upon vehicle occupancy, increased commuter busing, forced private resort busing, etc because hoping/wishing/praying that people will carpool and/or take public transit has simply not happened and nothing will change until people's behavior is forced/mandated/incented to change. The obvious solution is to increase the number of public transit buses during peak winter days to see how much of the problem that could alleviate, then reevaluate and take further refined steps. Any proffered solution must also take into account that not all winter users of LCC are resort skiers and that locals should have clear advantages over tourists. The argument by UDOT that tolling disadvantages the poor is laughable as most skiers possess SUV, in excess of \$1200 worth of gear and are paying upwards of \$1000 for season passes or \$200 per day to ski....hardly the assets or daily expenses of one who is poor. Also during one UDOT public presentation UDOT said that neither Alta nor Snowbird had committed any financial figure to assist with this problem, other than maybe shuttles for the workers. That's simply not enough and more must be done and committed to by these resorts.	Scott Klepper	Website
6267	Good Evening, Please see the attached public comment submitted on behalf of Friends of Alta, a 501(c)(3) land trust and environmental non-profit. Please contact us for any further questions or clarification. Sincerely, Kyle Maynard Executive Director, Friends of Alta	Kyle Maynard	Email
6268	Bus Service: I understand not going down to 5min headways due to time to unload, but you could run 2 buses at a time, so 2 buses show up at roughly the same time. This would double the capacity. The park and rides can handle 2 at a time, and the resorts could make small enough adjustments to handle it. I often see 2 buses simultaneously at the resorts already. Gondola Option: The report says there would be no parking at the platform at the entrance of LCC. Parking at the entrance needs to be maintained. There are a significant amount of users who park there to access climbing areas immediately next to the parking lot as well as across the street, year-round for rock and ice climbing, as well as mountain biking, cycling, and running. What is the plan for parking if the platform takes up that parking lot? The platform could be located next to the parking lot instead, and the parking lot remains as is. The report also says the gondola has a capacity of 5,000 people per hour, but the report uses 1,050 per hour. Explain how this number was calculated as the appendix does not explain. Use a realistic number of cabins and frequency, then what's the actual capacity? How many cabins and how often are they running? Cog Rail: The cog rail was eliminated because the report assumes a large parking structure is needed at the entrance. The parking lot can remain as is, and a bus can provide service to the train at the entrance. This would likely cause the option to pass Level 1 screening. Also, the report does not even discuss how a cog rail would be placed inside the canyon. What's the concept for that? The report only talks about the rail outside the canyon, which misses a major portion of this option.	Ryan Cuzme	Website
6269	Hello Josh, Bri, and Vince, Congratulations on getting to this milestone during the EIS process! Your team has done a great job and we look forward to continued collaboration. Attached are the comments from the Central Wasatch Commission regarding the screening and alternative reports. Thank you for the opportunity to comment and engage as a participating agency. Please do not hesitate to reach out to us should you have any questions. Thanks!	Blake Perez	Email

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6270	<p>I truly appreciate the opportunity to make a few comments on the proposed UDOT alternatives for the Cottonwood Canyons, more specifically, Little Cottonwood Canyon. My comments are general and address the overall process that has been on-going since the Mountain Accord days. I have asked that my name also be added to a community analysis as one of a large group of home owners who live in and near the mouth of Little Cottonwood Canyon. My opinion of the proposed alternatives is included there and I truly hope that this will be actually read and given serious consideration as there was a great deal of study, thought and professional analysis that went into these comments.</p> <p>Since the percentage of Utah residents that ski is only around 6-7% of the total population, there are a lot of tax payers and residents who will think of many more important uses for such huge amounts of our tax dollars. Too bad they know nothing of what is being contemplated for the benefit of two private resorts. So, before we all just roll over and accept the huge amounts of money being proposed for the benefit of privately owned resorts, I think it would be appropriate to begin posting the amounts of ski resort liability and responsibility toward these costs, and in specific detail.</p> <p>For example, the proposed parking or "transportation hubs" will be a substantial cost. Should tax payers bear the cost alone or should the private ski resorts, reaping the benefits, be required to accept their responsibility? Consider that businesses in Utah are usually required to provide adequate parking for the commercial operation they are engaged in. I had the privilege of building and adding onto facilities for our company that served Utah and the Salt Lake Valley for 64 years. When we had to present plans to planning commissions before obtaining permits we were specifically required to provide on-site parking on our own property for the projected number of end users. An alternative for this was to provide validated parking stickers for other parking facilities, but the burden still fell to us for providing parking for the customers we served. We were forced to accept the cost of parking for our customers one way or another. This prevented us from building larger buildings because we were required to have adequate parking on site where validated parking was not available nearby. Street parking was never a consideration permitted by the planning commissions we met with for approval.</p> <p>It seems that the privately owned ski resorts have been able to avoid this normal business expense and responsibility with the help of our tax dollars and the allowance of roadside parking on our highways and neighborhoods. The normal requirement of parking for private businesses has been overlooked or forgiven by politicians from the various cities and county and that has saved these private businesses. (ski resorts), many millions of dollars. Is it not enough that our state pays for Millions of dollars of advertising world-wide for these private businesses?</p> <p>I believe it is reasonable for citizens of Utah to expect that these businesses will be paying for the expenditures for these "transportation hubs", (parking facilities). It is past time that they accept this responsibility to provide parking for their customers rather than allowing tax dollars to do it. In addition, the on-site ski resort parking facilities are inadequate and the roadside parking in the canyon is just one more problem that creates a safety issue as well as detraction from the overall expected experience of the end user. If private car usage is continued to be permitted then the resorts must be held accountable to upgrade their inadequate parking facilities on their own property.</p> <p>This is merely one example of how the ski resorts are being provided with "special" consideration that other businesses do not receive. Some would call this discrimination against small business. A gondola option as suggested, would require significant outlay and the figures shown are intentionally misleading because they do not account for the snow sheds that would still be required or the roads would continue to be as dangerous and subject to the whims of the storms as they have been. This is the process that UDOT and special interest groups use. They low-ball construction estimates to get easier approval, a foot in the door, and then go back for funds to finish because initial estimates were intentionally low-balled for easier approval, but knowingly not enough for completing the project on budget. We can easily see this happening with the impractical gondola proposal.</p> <p>Through all of this planning, the hundreds upon hundreds of homes that are adversely impacted by this rush to aid the ski resorts have received miniscule, if any consideration by UDOT or Wasatch/Mtn. Accord and the various stakeholders. There has been zero discussions or concerns about any relief for the home owners held hostage to ski traffic through our neighborhoods. If we are all in this together then don't just concentrate on how to improve things for the top of the canyon, but rather consider solutions for the very bottom of the canyon equally. That brings me to one of my main concerns and that is the limited scope and area considered in the initial EIS.</p> <p>FLAWED EIS – Despite our attempts to have UDOT expand the EIS to include all major arteries leading into the canyon funnel, many of us believe the EIS, just completed, was intentionally abbreviated to reduce obvious costs and it should have covered expanded areas and a broader scope. The impact of road closures, long lines and denied access to hundreds of our homes has not been considered in any of these studies or plans that have concentrated on smoothing the access for skiers to the resorts at the top of the canyon. Certainly there is no thinking person that could argue these communities are not impacted. Any impact study needs to include all the areas of impact or it is simply . . . incomplete. Many residents feel this is an ugly reality of our community leaders where the money from visitor's two week vacations is more important to tax base coffers than our lives as residents and property owners. There have certainly been NO efforts that would convince us otherwise!</p> <p>On many days, the lines of traffic clog every access artery leading into the mouth of the Little Cottonwood Canyon. Skiers have found back roads through neighborhoods that give them a few minutes advantage to get into the main stream of the bumper to bumper progression, and they virtually jam every access and prevent residents a reasonable return time back to their homes. There are times when park and ride cars are left in our communities and to such an extent, that it frequently feels as if we have built our homes in the middle of a major parking lot. There are times when returning to our residence after a quick trip to run a child to school or quick trip to the store or early appointment cannot happen for 1-2 hours. This is totally unacceptable! Do Utah resident home owners not warrant more consideration than this??? So far the answer would be a resounding NO! That is a shame and should be an embarrassing admission from every mayor, city council member, state legislator and Governor, but it seems it is easier to just ignore a difficult situation.</p> <p>The only way to resolve these problems is to include at least the main arteries leading into the mouth of the Little Cottonwood Canyon funnel in the total EIS. Failure to do this will prevent these troubled areas from sharing the benefit of serious consideration and optimum solutions. Denying homeowners and residents access to their own homes without waiting in the same 1-2 hour lines is totally unacceptable. The thinning of traffic must take place before it enters the funnel, which begins at Wasatch Blvd. It's a huge problem for hundreds of homes, not just one or two or a dozen or so!</p> <p>All efforts, all planning, all expenditures have been focused on getting more people to the ski resorts at the top of the canyon and none have given equal concern to the detrimental problems at the bottom of the canyon and the arteries leading into the funnel of the canyon. More studies, more time and less haste to spend tax payer's money need to be explored with more detailed EIS and alternate studies to determine several major points of concern.</p> <p>1- What percentage of daily ski traffic come from Utah Valley, Draper and what route do they use to access H-209, H-210? If it has not been done then it needs to be studied. If it has been done then the results need to be made public. There are days when Wasatch Blvd are grid locked for nearly 2 miles south of 9400 S and for over 1 mile west of 9400 S. These routes can't handle the kind of access they receive without creating grid lock for residents trying to regain access to their homes if they must leave during heavy traffic periods.</p> <p>2- What is the Canyon's carrying capacity? What amount of traffic and general usage can Little Cottonwood and Big Cottonwood canyons handle. No formal study has been completed to determine this and yet we are proceeding without that kind of knowledge and ready to spend hundreds of millions of dollars. We may find that a responsible study could indicate that we have already exceeded responsible carrying capacity. Certainly, we know for a fact that the use of these resorts for Olympic venues were not considered because it was determined to be detrimental to the environment of these small and fragile canyons. What has changed???? What made them less fragile?? The public needs many more answers that have not been forthcoming.</p> <p>3- These public comment periods are great, but with the very limited advertising, the vast majority of Utah residents have no clue that these expenditures are pending or being considered. There needs to be much greater resident involvement. The number of people responding to this public comment period will be dismal compared to any professional organization's attempt at getting a representative consensus. For example, Envision Utah would likely obtain comments from 20-50x or more than the number of people responding to these three presented alternatives. I guarantee that the vast majority of Utahans who will share the burden of paying for the costs of subsidizing the private ski resort owners and more UDOT programs are still not aware of the proposed expenditures for these canyons.</p> <p>Finally, I want to copy a small portion of our community endorsed response to UDOT and these presented alternatives. They are so well presented that I include them as part of my comments in the hope that more people might have the opportunity to see and consider such serious and professional analysis.</p> <p>Carrying Capacity and Other Issues The additional critical points regarding the future of LCC are related to but not directly tied to the UDOT EIS.</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	C Craig Zimmerman	Website
6271	<p>The reason I'm submitting these comments is because I am a skier who has been driving up and down the canyon several days a week for over 4 decades and know the issues. There is a lot to digest in the 438 pages of this comprehensive and extremely informative "Draft Alternatives Development and Screening Report", and I commend UDOT for its thoroughness.</p> <p>It is well documented that Little Cottonwood Canyon Road has one of the highest avalanche risks in North America. Snow sheds should have been built years ago as a major step in improving reliability and safety in the canyon. With either of the enhanced bus alternatives or the gondola, and with or without tolling, there still will be quite the variety and need for vehicular traffic on the canyon road; residents, employees, non skiers, non resort traffic, deliveries, maintenance, construction, and other services (emergency or non emergency), conference wedding and convention business, taxis, canyon transportation companies, charter buses, destination hotel guests, timeshare owners.</p> <p>Building the snow sheds should be a first step, regardless of any other alternative.</p> <p>Snow sheds won't completely solve the road reliability issue. I know this because I have been to Zermatt in Switzerland and avalanches overwhelmed the snow sheds and closed the road and train tracks on the day I was supposed to leave. I had to take a helicopter out of the canyon.</p> <p>Nevertheless, snow sheds in LCC would</p> <ul style="list-style-type: none"> - Eliminate or reduce the number of road closures for avalanche control - Improve the traffic flow for buses and vehicles during the problem periods; some weekends, during or after storm days, and holidays. <p>My impression is that solving this problem would require a synthesis of two or more alternatives considered in this order:</p> <ol style="list-style-type: none"> 1. Build snow sheds. 2. Keep the same ski bus routes and stops, and increase the number of buses (headway) with now additional roadway capacity in LCC. There should be stops on the bus route as there are now. 3. The gondola sounds lovely and world class, befitting the quality of the ski areas it will serve, especially if it is just the cost of a bus ticket to ride it. The gondola should be the "point-to-point" option as opposed to the enhanced bus alternatives. Snow sheds should be included in the gondola option because of the need for the road to carry other vehicular traffic as noted above. The road would be a necessary fall back if the gondola could not run due to severe weather (i.e. wind and/or lightning) or power problems. 4. Enhanced bus with road widening but with current bus stops. 	Neil Cohen	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6272	<p>I'm really disappointed in the options provided in this EIS. They all come from the viewpoint that we are going to build our way out of the problem, which is not going to happen. To solve the problem without completely ruining our amazing canyons, we need to adjust human behavior. I will provide insight into the flaws I see in each proposal, and then my suggestion for how things should be approached at the end.</p> <p>Enhanced Bus Service:</p> <p>This is the best option only because it is the least invasive and least expensive. But it is still fatally flawed. There is still going to be massive congestions on all the arteries leading to the area and the cars that are still going to drive up the canyons. This is especially the case because you are building one of the mobility hubs at the mouth of Big Cottonwood, so to access it, cars still need to either drive north on Wasatch Blvd, East on Fort Union, or exit off of 215. So it alleviates none of the congestion in these areas. Then, the buses will be stuck in this traffic and will therefore be just as slow, but much less comfortable. This will just lead people to choose to sit in their cars in traffic rather than cramped in a bus in traffic.</p> <p>Enhanced Bus Service in PPSL:</p> <p>The point of the National Forest is to preserve and experience the natural environment. We don't want a giant, multi-lane highway going through it, nor the environmental damage caused by building and maintaining it! And while this will free up buses to move quicker than traffic once they make it into the canyon, you still have the problem of all of the congestion between the canyon mouth and the mobility hubs caused by cars wanting to get up canyon. The buses will be stuck in this traffic, causing the same issue I described for the Enhanced Bus Service.</p> <p>Gondola:</p> <p>For the love of God, take this off the table immediately! This is an expensive tourist attraction, not a serious solution for alleviating congestion for locals. The congestion in the canyons only occurs on big powder days, where everyone is showing up at once to try to get first tracks. The Gondola will not be able to haul enough people in that short amount of time to provide any sizable dent in the congestion. Then, in order for someone to ride the gondola, they have to drive to a mobility hub, get out of their car, wait on a bus, ride the bus to the gondola, get off the bus, wait in line for the gondola, get on the gondola, and then finally get off at the resort. This is a stupid amount of steps that will take just as long or longer than driving or riding the bus, plus it is more hassle. On top of all that, again, National Forest = preserve the natural experience! We do not want to have this gondola and all of its cables and towers ruining the view of the mountains!</p> <p>The Right Solution:</p> <p>The population of the valley is only going to go up. As such, we are not going to pave our way out of this congestion issue. Put in more asphalt and more cars will show up to fill it. Put in more parking lots around the canyons and more cars will show up to park there, until the lots are full and the roads getting to these canyon parking lots are gridlocked, blocking any attempts at speedy bus services. If you really want a long-term solution, you need to stop catering to cars! (and I say this as someone who drives a car up the canyon.) You want to solve the congestion issues in the canyons? The first step is to stop allowing cars up the canyon, period! Make it a bus-only road, but connect it to the wider public transportation system so that people can access the system near their house, or from several hubs distributed through the valley (Not right at the canyon mouth!). Then implement your Enhanced Bus Service plan so there are enough buses to service the people accessing the transportation system from throughout the valley. But don't widen Wasatch Blvd, because if there aren't all the cars trying to get to parking lots at the canyon mouth or get up the canyon, then there isn't traffic! If you really want to solve this problem long-term, you need to force a change in human behavior by preventing the use of cars to get up the canyon (at least in winter when it is most congested, to start) and provide a good enough public transit system to get everyone up canyon.</p> <p>Like it or not, this valley is becoming a dense urban area, and will only continue to get more populated. The only solution to our congestion woes are to stop catering to cars and start making it possible for people to utilize high capacity public transportation. So please, don't spend our tax dollars on expensive construction projects that will not solve the problem and will irrevocably mar our canyon wilderness. Be bold and switch your mindset. Cater to people and the environment, not cars, by making the canyons bus-only roads, increasing the number of buses, and establishing mobility hubs further out in the valley that won't just provide access to public transportation up the canyon, but to other locations in the valley as well.</p>	Douglas Rombough	Website
6273	<p>Of the three options, I most support the enhanced bus with roadway widening, then the gondola, then the enhanced bus without roadway widening. I believe the enhanced bus with roadway widening will do the most good with the least harm to the canyon's environment and least amount of stress to commuters, and provide new recreation possibilities in the summer. I feel that the enhanced bus with roadway widening will allow buses to most seamlessly get people up and down the canyon, without snarling traffic like I feel more buses without the road widening would cause (the biggest nuisance getting up and down the canyon on powder days is stuck vehicles, and a designated lane would allow more room for buses to get up and down the canyons without adding to the traffic issues).</p> <p>I feel the gondola is a good plan B, but feel it has by far the most dramatic impact on the canyon's environment, and would be the most involved in terms of building and the longest commute of the options. I prefer more lower-capacity options more often than larger-capacity options less often.</p>	Isaac Hale	Website
6274	<p>Regardless, thank you for taking steps to improve peoples' experiences in Little Cottonwood Canyon – Y'all rock! (And something like this should happen to Big Cottonwood Canyon too, I think).</p> <p>The gondola is the best option. Better long term value. Better for the fragile environment it is going through.</p>	MICHAEL MARTY	Website
6275	<p>The best approach to this problem is one that takes cars off the roads...period. Encouraging more people to drive to the ski resorts only adds to the congestion, gridlock, air/noise pollution and presents a danger to those that live in neighborhoods along Wasatch Blvd. I see that on all three alternatives Wasatch Blvd would be widened, so I guess that's a given and you don't want any input on that? I wish the summary would have included detail on the widening. How many lanes? I've heard all the way from five to seven lanes. This would definitely not help in reducing the number of cars on the road. The solution should encourage those that would normally drive a car to take public transit, so there has to be a huge incentive and convenience for this to happen. Providing bus-only lanes going up the canyon, increasing the frequency of bus transportation up the canyon, instituting a toll (at least in the winter time, if not year-round), and developing the gondola for mass movement seems to be the best approach. I'm not sure what that means to widening Wasatch, but making it a seven-lane thoroughfare through a neighborhood community would be absolutely ridiculous for reasons stated above - increased pollution, huge neighborhood impact, and doesn't solve the gridlock/congestion problem. This approach would be totally irresponsible. The future lies in providing convenient mass transit to get those cars off the road! Thank you.</p>	PAT HOLMES	Website
6276	<p>After reviewing the EIS produced by UDOT, I am still trying to figure out the benefits to anyone other than skiers who use the canyons during a brief period of the winter. The gondola option will not meet the need to reduce car traffic in LCC but will negatively impact both the viewshed and, most likely, the watershed in the canyon. Increased electric bus service appears to be the only option that doesn't permanently, and negatively, alter either canyon yet addresses the need to reduce car traffic, although the Transit Hub concept will not benefit the quality of life of the nearby neighborhoods. Also, the idea that UDOT needs to try and control or mitigate avalanches is hubris at its best. What about the impacts to hydrology or erosion in the canyon caused by any of UDOT's alleged solutions? Again, the negative impacts of the changes proposed in this EIS outweigh any benefits -- unless you own a resort. Last, all of this also begs the question that if this study is to benefit transit, why isn't UTA leading the process? UTA does transit while UDOT builds roads; a road builder designing a transit solution is doomed from the start. I would like to see this EIS redone to include input from UTA and a review by the Central Wasatch Commission. The fact neither appears to have been directly involved in the creation of this proposal is alarming.</p> <p>For those of us who don't ski but do hike in both Cottonwood Canyons, this plan provides no protection of OUR interests in maintaining the environment, to include wildlife. Part of the reason why a lot of us like living along the Wasatch Front has nothing to do with skiing but everything to do with the majesty of the mountain range and the benefits of being in nature on one of the many trails available. Sadly I see nothing in this plan to protect that. The proposals in this EIS are myopically focused on benefits to a limited segment of the population but will have negative impacts on the majority of us who live in the Salt Lake Valley. Given the amount of interest in this issue, I expected better.</p>	Lianna Coleman	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6277	<p>To whom it may concern,</p> <p>I always feel the need to engage in these comment periods, as I live and play year-round in the town of Alta. For what it's worth, I don't own a home anywhere else. I actually live in Alta. The decisions made with this project will directly affect the place where I vote and call home.</p> <p>We can't deny that the traffic in LCC has only gotten worse over the years, and with the addition of more and different passholder traffic, the canyon has only gotten busier.</p> <p>The first question I would like to ask is whether or not we even want this traffic. Is having more people better? Is it necessary for us to accommodate more visitors in this small canyon? Is it necessary for business and livelihood? I don't know. That's a decision for people above me who facilitate my lifestyle and availability for a job. But, hey, I live up here. So I think the first thing we need to ask ourselves is: Why?</p> <p>If we agree we want more people and business in the canyon, then we can agree that we need to solve the traffic issue in LCC. Highway 210, as-is, just won't cut it anymore.</p> <p>Assuming there is plenty of parking and there are more than enough hours of operation, a Gondola sounds effective and downright fun. Put everyone in some gondolas at 7am so they can enjoy a view and their morning coffee before they get in the corral earlier than ever before! Hell, maybe visitors can still grab some apres before catching the last Gondola back.</p> <p>I will choose to leave my armchair-environmentalist thoughts aside, because again, someone else who knows more than I can handle that. Let's just assume the gondola would be built with all native species and natural wonders completely and entirely untouched. Right? Right.</p> <p>On the other hand, we currently have a Bus system in LCC. There also are some light rideshare programs in place. Based on the Recurring "Red Snake" I've been seeing, I don't think these systems are working as well as they could. Yet, they are there waiting patiently to be put to their full potential.</p> <p>All proposed new transportation solutions seem to be a move in the right direction. It's just a matter of how big you all think you need to go. Does it seem smart to jump straight to the gondola idea? Maybe start by improving what we have instead of building towers and permanent view-obstructing machinery. I don't have the strongest opinion on the actual form of transit. I won't be taking it. The bigger issue to me is making sure it is put to good use by the visitors and it isn't downright offensive to those that reside in the canyon.</p> <p>I'd like to give my own two cents on why people don't use current public transit in LCC: -There is no cost to drive up the canyon (yet) -There is no cost to park at either ski area (yet) -There really isn't much parking at the base of the canyon (yet) -There is no time saving/convenience benefit of taking the Bus (yet)</p> <p>Who wouldn't enjoy the comfort of their private vehicle when it simply is more convenient and enjoyable than taking the bus or sharing a car with your smelly friends with their own schedules and stipulations?</p> <p>The great part is that there will be serious progress made with just the other ideas in the proposed plan: -More parking at the base of the canyon. Perfect. -Snow sheds. Genius. -Lessening available parking by eliminating roadside parking. Great incentive. -Tolling at the bottom of the canyon. DING DING DING! WE HAVE A WINNER!</p> <p>If anything can disincentivize people from testing out their driving skills in a foot of snow in bumper to bumper traffic, it's charging them to do so! You know what sounds a whole lot better? Sitting in a gondola car or hopping on one of the many busses populating UT-210. Hell, it'll be cheaper to take the ride instead of driving, right? Right??</p> <p>The most important issue isn't providing a more convenient public transportation system to be forgotten about and driven past. It's about making driving up LCC in a personal vehicle seem worse than taking public transit. Maybe unfortunately, the best way to do that may be to include a bit of a price tag for doing so.</p> <p>I do hope this comment is read and understood. I would like to take a moment to thank you all for what you do and are doing. I especially would like to thank you for giving the people a chance to speak out. It does not go unappreciated.</p>	samuel askins	Website
6278	<p>So much to cover. UDOT is all about building, not much here about encouraging carpooling. Being that there is tolling infrastructure (\$5 million!!!) that can be used for collecting fee for cars with less than 3 occupants. So I would be in most favor of enhanced bus service option. With least amount of widening of Wasatch Blvd.</p> <p>The gondola option with multiple transfers would not be so popular. Can't guess what a 1000 car structure at mouth of LCC would cost. And all this\$\$, just to take off a third of cars.</p> <p>What will be the impact on the resorts and Watershed with all these additional people. PS. I worked and skied at Snowbird from 1979-2002, so I have spent some time up there (knew Carlos). Things have gotten crazy and squeezing even more people will?? One more. The cost of snow sheds seem to be Not worth it. It doesn't keep the road open much more. When danger is very high, the road still won't open and the lifts would be closed.</p>	Jeff Mikaelian	Website
6279	<p>We would like to have UDOT present other options that were not presented in the draft options. That would satisfy the public curiosity that has surrounded canyon transportation solutions for many years. A train or monorail might need more accurate study. At least the public should know the details of those other top options. Will there be an opportunity for further study and public comment on other draft options?</p>	Barbara Cameron	Website
6280	<p>I believe that increased bus service only is the best option. I am concerned however about the millions of tax dollars that will be spent just to benefit two private businesses. There are many more user groups whose input needs to be taken into account. Personally I believe in just increasing electric bus service and having a toll on the busiest of days will suffice. LCC is a special and magical place that needs to be protected and kept as wild as possible.</p>	Casey Lavallee	Website
6281	<p>Gondola my choice</p>	Mike Ryan	Website
6282	<p>I am in support of the gondola. It's is a no brainer!</p>	Amanda Greene	Website
6283	<p>I strongly urge UDOT to support Enhanced Bus Service with Roadway Widening as a reasonable solution to traffic congestion in Little Cottonwood Canyon. This would take into account addressing not only commuters needs, but also offer provision for enhanced avalanche protection.</p>	Anita Leach	Website
6284	<p>I support the gondola over widening the road and adding an extra lane. The gondola will be more cost effective, is better for the environment</p>	Dustin Glazier	Website
6285	<p>I agree with UDOT in creating 4 or 5 lanes on Wasatch Blvd. It is a widely used through fare with ease to the Cottonwood Canyons.</p> <p>I wrote a big comment for the City of Cottonwood Heights, and tried to email it to you.</p>	Amie Kelsch	Website
6286	<p>This is already out of date. And by 2050, anything we do right now will be hideously old, out of style, and embarrassing. I see someone is already advertising a #4 choice of utilizing the La Caille property as parking and base for the gondola. And I know of another property that will be for sale.</p> <p>We want our speed limit back to 35 mph, safe turning in and out of the residential streets, all the homes saved, our neighborhood restored to wholeness, and the traffic and the horrible pollution rising of miles of parked cars idling while parked on the road. Traffic backed up to the high T intersection should be directed on down to sandy's gravel pit parking and mall. give them a choice of a very expensive idling ticket or moving on. to a more comfortable waiting place--adjacent mall with warm drinks, food, bathrooms, wifi. Put up some barricades that allow residents only into the residential area. give us stickers for our cars, and facilitate us and our drivers in the traffic when the traffic does start to move.</p>	Lee walker	Website
6287	<p>The number one solution is that all resort employees and single occupancy vehicles must take the bus with an exception for critical resort personnel. Increasing the opportunity for more vehicles in the canyon does nothing to curb the congestion problem unless you remove the quantity of vehicles experiencing the bottle necking at several locations. Enforcing no single occupancy vehicles is also better for the environment. With this in place, I'm also for the expanded road (two lanes both sides - the entire way plus extra lanes all the way to the freeway), snow sheds and enhanced bus capacity. As a near daily commuter of the canyon for the last 13 years, I don't think any of these solutions are fit to last more than 10 years unless coupled together. On the environmental debate, I'd sacrifice the land to reduce the number of cars that sit idling in traffic. My primary argument against the gondola is travel times and logistics. The extra shuffle of hauling gear from car park to gondola to bus to resort is simply not practical. Have you ever ridden the cabriolet to get to the Canyons base? It's the most annoying aspect of skiing PC at Canyons. Now can you imagine if nearly everyone was forced to ride it at the base of LCC during a powder day? No one is going to wait for it when the alternative option is to drive. I'd easily sacrifice sitting in my car for 20-30 min of traffic just to not shuffle and haul gear especially when it's cold outside. In the nicest and rational way possible, I'm also not interested in seeing a giant gondola in future Ski Utah and Ski City Ads. We don't need more inexperienced people coming to the Cottonwoods because our mountains look like an amusement park with a glamorous gondola ride. Keep those crowds to Park City please. The gondola is like a beacon for inviting this type of quest and this creates unsafe skiing and riding situations for all due to the limited amount of beginner terrain the cottonwoods have available. I'm all for bringing more people to the mountains to ski for the first time, I just don't think the Cottonwoods are the place for that. Again, we have park city resorts to accommodate this market. I know I may sound a bit selfish here but I am saying this earnestly because I know many will say one thing and practice another. This is America, and Utah, and we are all selfish to a degree. We all drive everywhere and I don't see that changing any time soon, so the only way to truly hit that problem on the head is to take away our right to drive solo up the canyon.</p>	Rob Aseltine	Website
6288	<p>Enforce that and many more will find a way to carpool relieving much of the stress creating this whole conversation. That needs to be an option people can vote on. Provide data on \$ saved by carpooling. Provide Environmental data on the impact. Also, more people will carpool if they know there is an easy option to take a bus if carpool schedules only align in one direction. If it doesn't work, provide further incentives, for ex. work with resorts to award food or pass discounts for # of days carpooled etc. It can work! Lastly, if the gondola is the popular vote. Why in the heck would you not have the Alta and Snowbird drop zones be direct drops where people can ski right off the platform to the lifts or lodges if they so choose? Build ramps or something, skiing and riding in itself is a method of transportation that requires no additional capitol, little additional environmental impact, and it's fast! I challenge the designers to re-engineer the drop zones so that concept could play out. I would be way more open to the gondola if that were the case.</p> <p>The alternatives as shown are misleading and inappropriate. I believe the major focus of this study is keeping Little Cottonwood open and people being transported to up the canyon. In order to evaluate this you must examine the number of hours the alternatives will be available during times of congestion times of current closure. I will focus on closures. Currently the canyon is closed on average 59 hours per year. Snowsheds would reduce this time to 11 hours per year while the Gonda would be closed due to intense snowfall 0 hours per year. However, as snowsheds are not included in the Gonda option the listed personal vehicles would not be supplying transportation. We should thus compare the increase in transport.</p> <p>Alternative 1 and 2: 59 hours is reduced to 11 hours for a 48 hour per year increase for all 3,257 people per hour. This results in an increase of 156,336 people annually up the canyon during this currently travel limited times. Alternative 3: 59 hours of average annual closure is reduced to 0 for 1,050 people per hour. Thus it is an annual increase of 61,950 people annually up the canyon. This is an increase of 40% less than the snowsheds so these Alternatives should not be displayed as equivalent.</p> <p>In addition, with the inclusion of snowsheds alternative 1 and 2 drastically increases the safety of the canyons for canyon drivers throughout the year. Based on these two facts the Alternative 3 must have snowsheds added so it is a fair comparison to the other alternatives. Further, in recent years the canyon has experienced numerous washouts of the roads. All the alternatives should have road improvements included to protect throughout the year from these washouts.</p> <p>Last, as a resident and home owner in Sandy near the mount of Little Cottonwood Canyon who regularly hikes, rock climbs, and skis in the canyon throughout the year I support the construction of snowsheds. Snowsheds will increase safety on the road all year round and will benefit all users of the canyon. Be it residents, tourists, or recreationalists. I am in strong opposition to the construction of a Gonda and will oppose it via local government and at the federal level. A Gonda is not justified and would destroy the wilderness nature of the entire canyons. Currently, much of the impact of the 2 resorts is kept contained to their boundaries and surrounding areas. A Gonda would be a massive project impacting the entire canyon with nearly no return to the local community who paid for it. This project is a loss/loss for the taxpayers of Utah who will pay for it.</p> <p>For Wasatch Blvd I support the Imbalanced Alternative. This alternative will address issues on Wasatch Blvd without bringing additional traffic to the road which is currently not present.</p> <p>Thank you,</p>	Ken Hoffman	Website
6289	<p>While it is entirely true that action is needed in order to preserve Little Cotton Wood Canyons natural beauty, limiting the number of motor vehicles by constructing aerial gondolas is entirely the wrong approach. Gondolas are the worst possible action and I cannot stress this enough. NO GONDOLAS. Limit the number of vehicles, increase public buses, and charge a fee for solo vehicles, it's that easy.</p>	Daniel Vise	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6290	I am strongly for the increased bus WITHOUT widening the road. I am strongly against a gondola and widening the road. The gondola will serve only the ski resorts and not any other user groups. Widening the road will damage valuable resources. Additionally, the increased buses has the potential to service big cottonwood canyon. I do not understand why big cottonwood canyon is not part of this plan. If we only address little cottonwood the problem will remain. I think the gondola is the absolute worst idea and I will be so disappointed if that is the choice.	Cynthia Levinthal	Website
6291	<p>At this point, from the information given in the draft report, the widening and gondola options do not pass Level 2 screening. They likely should not have passed Level 1 screening since many other factors were missed and not considered.</p> <p>The report fails to address or even consider dispersed users which needs to be a major consideration. The report talks about possibly eliminating roadside parking throughout the canyon. The widening option reduces major parking areas in the lower canyon, and I expect the gondola option to also reduce major parking areas for maintenance access. Options that do this will create an unsustainable configuration, and cause more safety and mobility problems.</p> <p>Year-round, especially during spring through fall, the lower canyon is heavily used. There are many climbing areas where people park along the road, and any given weekend, weekday evening, you will see hundreds of cars that currently do not reduce mobility since there is enough space to park in those areas. The Gate Buttress is one example. It is not feasible to eliminate or reduce the amount of parking in the lower 2mi of the canyon or throughout the canyon. Lisa Falls and the pump house are other examples of heavily used pull-outs, and the parked cars do not go past the white line marking the shoulder.</p> <p>It is very likely people will still find ways to park along the road, even if it is not legal. Look at the Orson Smith trailhead in Draper. The parking lot is full every weekend, and hundreds of cars park IN the road. Their cars take up half of the travel lane in each direction. People also already do this in the canyons at the ski resorts; the expense of a ticket is still worth it since parking is no longer free, and they already spent 1-2hrs driving up there.</p> <p>The enhanced bus service assumes they stop only at the resorts. This means thousands of backcountry skiers, snowshoers, hikers, ice climbers will still need to drive their own vehicles. These users park at various pullouts and shoulder ares throughout the canyon.</p> <p>I've seen other people state that the chosen gondola system is zero emissions. This is not the case. The power still has to come from somewhere. What are the emissions, carbon footprint, greenhouse gas emissions from these different options? This needs to be considered given the climate change.</p> <p>It is unlikely the gondola will be used very much during the spring through fall. The gondola is mainly for the resort skiers, and services no other users. This option places a lot of infrastructure throughout the canyon that will remain fairly unused during the spring through fall. How much would this cost to ride? The cost of a ride may be a huge deterrent to even use. The towers would be placed very close to climbing areas, reducing parking, negatively affecting outdoor experience, and hindering search & rescue.</p> <p>I'm on Salt Lake County Search and Rescue. About 10% of our rescues result in a helicopter hoist operation and landing in the roadway due to very critical patients needing the fastest medical attention, and about 50% of rescues use a helicopter in general. The gondola cables running next to climbing areas may make aerial hoists impossible, adding several hours to a rescue, which can certainly make the difference between life and death of a patient. We have had Life Flight pick off an injured hiker or climber from those areas, land in the road, and immediately provide medical attention/operations on the road. Life Flight must land to get the patient in the helicopter; they can not bring a patient into the cabin while they are on the hoist.</p> <p>The widening and gondola options will have a huge negative impact on the area, and of course a lot of outdoor organizations will have a huge negative view of UDOT and decision. Organizations like Salt Lake Climber's Alliance (SLCA), American Alpine Club (AAC), the Access Fund, Save our Canyons, Protect Our Winters (POW) have all made differences in the national legislature in person in Washington, DC. They have made changes to help protect public lands, national parks, wilderness areas, etc. Little Cottonwood Canyon is known world wide for it's access to climbing, skiing, and has an enormous history in these regards. Eliminating or significantly reducing the access is not an option.</p> <p>If we are going to do this it would be wise to consider rail. The life time cost of busses is exorbitant and a road has always been utahd approach to out detriment. The stats that were provided on the speed and efficiency of a cog rail we're highly inaccurate and it would look bad for the state to appear as though we blocked rail as having an opportunity. A one seat airport to resort experience would make Utah the greatest state for eco responsible tourism and public users of recreational land usage. It would give me great pride in our state to consider such a great option.</p>	Ryan Cuzme	Website
6292	In my opinion the worst option on the table is Alternative 1, enhanced bus service with no additional road way capacity in LCC. This is a substantial amount of money that will only make the situation different not better.	Kaden Killpack	Website
6293	Alta and Snowbird are special slice of the earth. Putting in a gondola is absolutely not the answer. Enhanced bus service would solve the route of the problem and still keep Little Cottonwood Canyon special. Please don't mess this up.	Charlotte Miller	Website
6294	Please increase bus service but do not widen roads or add new infrastructure. Cottonwood Canyons are a special natural resource and additional lanes or construction of a gondola would severely impact and detract from this beautiful canyon.	Tracy Fisher	Website
6295	I would like to see the gondola alternative option because it is the most eco-friendly and I think that a lot of Utahns would appreciate something that wouldn't put as much pollution in our valley. While widening the road would greatly lower transit times with the bus option, I think we should consider that this would involve destroying our beautiful nature. We are blessed with the mountains and nature we have in this canyon and I believe people would rather it take a little longer to get up and to be able to see this fascinating sight than getting up quicker with a less beautiful view. Additionally, the gondola would be a GREAT way to be able to see the canyon from a different perspective which could attract people to use it for more reasons other than simply transit.	Alexxis Ward	Website
6296	<p>I whole heartedly support Alta Ski Area's request. Namely, that we choose the gondola alternative but with the modification of adding a very large parking facility at the base of the gondola. Unfortunately, we as Americans seem to hate public transit and the logistics associated with using it. If we can drive to the base of a gondola, park and then ride the lift to the ski area, the average user will perceive this as not using public transit but rather driving to the base of a lift. This option will be the one most embraced and utilized by the public in general. The expense might be considerable but we are already considering spending nearly half a billion dollars. Spending a bit extra to do it right is the only reasonable thing to do.</p> <p>In my opinion the worst option on the table is Alternative 1, enhanced bus service with no additional road way capacity in LCC. This is a substantial amount of money that will only make the situation different not better.</p> <p>Our choice must really come down between Alternative 2 and 3. Both are a significant expenditure but we must come up with a way to drastically change the current situation. I must reiterate though, neither solution in the current form is really the best solution. We need a gondola with a massive amount of parking at its base. Whether this means a large expensive parking structure or it means, displacing residents at the base of LCC (at significant cost), we need the gondola with parking at its base.</p> <p>I do believe tolling the upper canyon is a good way to limit vehicular traffic to the ski areas, while providing access for those just looking to access the backcountry. This toll though must be set at a prohibitively high level. It should not be considered as a revenue stream and priced accordingly but rather as a way to prevent vehicles from using the road. It should be jaw droppingly expensive. Furthermore, until one of the alternatives is implemented, we should start tolls on the upper road as soon as this winter. The goal should be to limit the number of vehicles to the ski area. The fee structure should be based on increasing the number of vehicle occupants trying to incentivize carpooling. Something like free access for a vehicle with three people or more, \$80 for two people and \$100 for only one occupant. I say this as someone who normally drives up by myself and could not afford the tolls I have proposed. I and many other people would be incentivized to car pool. Also, the toll should utilize technology such as some sort of EZ pass so that the toll does create even more traffic.</p> <p>For the Wasatch Blvd. portion of the plan I like both the five-lane option and the imbalanced lane option. While I feel that all we need at the moment is the imbalanced lane option, the cost of going with the five-lane option is only nominally more expensive and it is a much more long-term solution. Putting in five lanes now will save us money in the future and the headache of more future construction when congestion inevitably increases.</p> <p>Furthermore, to provide local season pass holders an incentive to utilize public transportation options, the ski areas should provide large season long locker rental so that gear can be left at the ski area. This gear would not have to be transported up and down the canyon every day on public transport, which can be a logistical nightmare compared with transporting it in a personal vehicle.</p> <p>We should also immediately change how vehicles are checked for proper equipment, such as AWD/4WD and snow tires. When the police set up at the mouth and individually check every vehicle it creates an incredible traffic jam. We should require that any vehicles utilizing the canyon in the winter be inspected and stickered as being in compliance. We should also invest in an infrastructure that would automatically check for a compliance status, so that officers do not have to do it manually.</p> <p>As a side note: If a third lane is added to LCC Road and it is utilized as a bike lane in the summer, we should install small bike-oriented signs like they have on European climbs. The signs indicate distance to the top, gradient next kilometer (we could use miles if necessary) and sometimes elevation. While we are at it lets install this sort of signage on all the canyon roads around SLC.</p> <p>Thanks for considering my comments.</p> <p>As an avid skier and former industry employee, I strongly believe that Little Cottonwood Canyon, and Big Cottonwood, have surpassed their winter traffic capacity and the time for a solution has never been more imminent. Unfortunately, Utah's famous snow is becoming overshadowed by traffic and parking issues diminishing the consumer experience and harming the potential of this powerful economic pillar in our community.</p> <p>After reviewing proposal information available online, I am not in favor of widening Wasatch Boulevard as that proposal will only hand our traffic issue to a future generation and does not address Canyon safety and pollution concerns. I am supportive of Bus Rapid Transit or the Gondola works proposal. That said, either of those options would require significant behavior changes on the part of the consumers, and a successful plan will address and incentivize those changes immediately.</p>	Fredrick Scott	Website
6297	<p>Those behavior considerations include:</p> <p>The convenience of parking and transportation to the Gondola or BRT hub. This also includes hubs throughout the Wasatch Front not just at the base of the Canyons.</p> <p>Options for people to store personal items at the resorts. Especially, with the popularity of the Ikon pass and more visitors seemingly lodging in the valley, onsite personal item storage is a must. Perhaps new days lodges with enhanced facilities could be located where parking lots had previously existed the resorts.</p> <p>Incentives for using the Gondola system instead of driving to the resorts. For example, will all resort parking be paid?</p> <p>Family convenience, will there be any special accommodations for families traveling to the resorts with gear and small children (similar to airports)?</p> <p>ADA compliance (goes without saying)</p>	Jessica Kunzer	Website
6298	The gondola option seems like the best option because we would not have to shave down more of the mountain to build a wider road. I would like to keep the beauty of Little Cottonwood Canyon while also providing a really diverse option for alternative transit. The cost of building and maintaining the gondola would not be cheap, but I believe the cost of destroying our mountain would be more.	Shea Tripp	Website
6299	Why in the world would you want to scar up the mountain with cables and towers for a gondola? Do you not love to see nature I disturbed?! NO gondola!! Stupid just stupid.	Suzette Johnson	Website
6300	Public access is most important to me. Rock climbing access preservation would be best with the bus option. Taxpayer dollars benefiting the private ski resorts does not seem best to me.	Guy McAtee	Website
6301	No gondolas. Not necessary! No more lanes	Ouille Theppakkhamson	Website
6302	It is imperative we find solutions for the growth we expect to see in the not so distant future along the Wasatch front. We also must find a way that does not completely degrade the Wasatch (by putting in another lane of traffic) or installing a gondola. We have to treat this like the resource it is and allow for more frequent buses like Zion national park does. The Wasatch is such a wonder and recreational resource for those that live in the valley that we must do everything we can to preserve it for future generations. The idea of having more frequent bus access is the most appealing because it maintains more jobs and allows for a greater sense of community. The last thing we need is more private cars going up the canyons just because I think it would make it feel like a free for all. With buses, visitors and Utahns might better understand that we want to use this space more respectfully as a community.	Hyojung Na	Website
6303	Thinking about the different way of commuting up Little Cottonwood Canyon in my eyes, would be rail. From an environmental stand point rail would be the least amount of impact from carbon emissions to traffic congestion even accidents. If a bus route was the way to go say the bus breaks down and leaks fuel. That getting into the stream could cause quite an issue with the eco-system from vegetation to the fish, so on and so forth. A gondola wouldn't be a bad thing either but you have to remember there is a lot of people that have a fear of heights. And they probably would rather just drive. You have to make it the most convenient for people flying into the Salt Lake International Airport to the final destination. That being Alta and Snowbird. With all the rail through out the valley I don't see why rail isn't the top option.	JD Laub	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6304	<p>Hello,</p> <p>I have read through the EIS and these are my comments:</p> <p>The population of the valley is growing, and tourism to LCC is growing; if we put down more pavement, it will be filled by more cars. I do not believe the proposed plans to expand the road will alleviate long-term congestion, but rather allow for more. I believe that the best solution is to close down the canyon to cars (maybe only during the ski season) and make it a bus-only road with drastically enhanced bus service from the hub. I have a feeling that this is the simplest solution as well as the most cost-effective. And we already know that skiers are willing to ride buses; ridership increased by almost 50% when UTA improved service!</p> <p>As for the Gondola - only tourists will want to park in the hub, take a bus to the base, then ride the gondola up. Locals will not want to bother with that many transitions. Furthermore, it would be unappealing to see cables and towers and Gondola cars when recreating in the canyon. Keep the views clean and pristine, even if there are a lot of people up there!</p> <p>Thanks for taking the time to read my comments.</p> <p>Sincerely, Dr. Jordan Herman</p>	Jordan Herman	Website
6305	<p>Of the solutions provided I think increased bus frequency with no road widening is the best option. The Gondola seems like a cool idea and maybe could work but would require increased capacity, better thought out parking, and further thought out cost structure.</p>	Bradley Allenick	Website
6306	<p>As an employee of LCC for 20 years and a resident in SLC for 33 years. I believe the gondola is the only answer. Granted the idea of taking busses to the gondola hub does not seem viable. I am worried many will not ride the gondola due to lack of parking facilities. No body want to ride busses already, so why bus to station GONDOLAWORKS, seems to have the best solution including the La Caille station with 1600 parking spots. I can say that if I need to ride a bus to get to the gondola. I will be heavily deterred. But if I could park near the terminal, I would take every day. I usually drive up LCC at 7:00 am on non snow days, but with bad conditions I would leave at 5 am-6:00am. I will ride the gondola if the a better solution for access is figured out, like the gondolaworks solution. I also believe in RFID readers at the bottom of canyon if tolls are applied to canyon cars. Employee passes for cars that charge a discounted rate, etc. I have accepted that LCC will never be what it was 20-30 years ago, so let's make it a fantastic experience, and the gondola provides a state of the art, and incredible experiences for skier to come visit from around the world.</p> <p>Thank you, Andrew Gardner</p>	Andrew Gardner	Website
6307	<p>Overall, I am very concerned that the draft EIS report does not adequately analyze the impacts of the Alternatives on dispersed recreation, especially in the lower portion of Little Cottonwood Canyon. Much of the climbing access and areas would be impacted by each alternative.</p> <p>Alternative 1 - Enhanced Bus issues. This Alternative currently lacks bus or shuttle capacity and pull outs to serve dispersed recreational users. Without capacity and pullouts people will not alter their habits and continue to use personal vehicles. There needs to be an analysis on the lack of vehicle capacity limitation or toll included in this Alternative as no one will be encouraged to take public transit. Electric buses or shuttles need to be vetted considering anthropogenic climate change. Closing roadside parking during the winter months will negatively impact access as climbers access the whole of the canyon year-round. The Alternative needs details on the proposed avalanche mitigation in the form of snow sheds which will have a considerable impact on climbing access.</p> <p>Alternative 2 Enhanced Bus - with roadway widening for peak period (shoulder lane) Given the potential impacts to the Gate Butress parking and roadside climbing resources, as well as the extent of the roadway widening, this Alternative must be fully defined and analyzed so as not to impact climbing resources and trails that the SLCA and the community have invested in substantially. Avoidance and/or mitigation of impacts to climbing resources from cut and fill and other construction activity within and outside the roadway widening must be analyzed. Overall there must be detailed analysis of the impacts of widening of the roadway on recreation in the canyon.</p> <p>Some of the most popular climbing/bouldering areas such as the Secret Garden, Cabbage Patch, 5 Mile, the Hill and others are all within 30 feet of the roadway. Understanding their location in relation to any proposed changes to the roadway is critical to understanding any impacts to these recreational resources. The EIS must have substantive details of roadway widening including estimated cut and fill as they relate to climbing resources. There are high capital costs and a long construction time for any road improvements. This plan would also drastically compromise parking at climber trailheads. The statement from Appendix C, "The presence of the PPSSL would not allow roadside parking on S.R. 210 at any time of year." contradicts the attached Alternative that infers roadside parking would be allowed when beyond a quarter mile from developed trailhead parking. Adding a new lane would have a very significant environmental impact in the canyon. Again, electric buses or shuttles need to be vetted considering anthropomorphic climate change. The Alternative needs details on the proposed avalanche mitigation in the form of snow sheds which will have considerable impact on climbing access.</p> <p>Alternative 3 Gondola - with bus from mobility hub - no additional roadway capacity This Alternative needs a detailed economic feasibility study of the gondola and its operation. The gondola Alternative also needs a detailed engineering study showing specific impacts to recreation in the lower part of the canyon. Including the lower LCC Park & Ride and impacts to the Alpenbock Loop and Gate Butress trail networks. The Alternative needs substantive analysis of the visual and noise impacts as well as the impacts to the user experience by the gondola. Further, the Alternative needs substantive analysis of the impacts of the gondola to the Scenic Byway designation as defined by Utah Administrative Code section R926-13.</p> <p>The gondola is ski resort centric and would most likely only be utilized during the winter months as during the other months the ski resorts are either closed or have a greatly reduced visitation and traffic is not an issue. Thus, it would lack capacity, especially given parking would be very limited at the base station and people" "will not be inclined to take a bus from a transportation hub. During weekdays of the winter months, when traffic is light, people will not be motivated to use the gondola as it will require parking at a transportation hub, waiting 10-15 minutes for a bus, riding for 10-15 minutes, waiting 5 minutes for the gondola, riding for 40-45 minutes, etc. Whereas driving will be much faster and convenient. Because of these factors, the gondola needs a detailed economic feasibility study of its operation. The gondola and its associated infrastructure will negatively impact the viewshed of the canyon, especially for climbers on the north side of the lower canyon. The added noise will detract from the user experience. Additionally, it does not service dispersed recreation users, therefore offering no benefit to climbers. The gondola would require infrastructure that will be expensive and pose unknown errors, challenges, and problems. There would need to be infrastructure at the base of the canyon leading to impacts to the Wasatch Boulevard communities as well as limiting access to the Alpenbock Trail network. Towers need to be built where infrastructure does not currently exist and would likely be placed adjacent to or within close proximity to climbing resources that could potentially force them to be closed. Overall, the gondola would have a large and lasting impact on LCC without benefiting the majority of the users.</p> <p>Pedestrian Safety While pedestrian safety at Lisa Falls with a cross walk and signal is addressed, it is not addressed throughout the canyon. For instance at the Gate Butress parking lot across the road to the pipe that the public uses to access the Little Cottonwood Trail. Pedestrian safety needs to be considered at the mouth of the canyon where during the winter months climbers cross the road from the Park and Ride lot to access the "Scruffy Band" for ice climbing.</p> <p>Gate Butress Parking The Gate Butress parking lot is currently on land privately owned by The Church of Jesus Christ of Latter-day Saints and leased" "by the SLCA and the Access Fund. To that end, substantive conversations need to be had between these parties regarding future ownership and development. The Gate Butress parking lot capacity in the document is significantly reduced compared to current use levels. At times there are 50 to 80 vehicles parked in the Gate Butress Lot and on both sides of the roadway. From April 1st to November 24th, 2019 over 14,500 individuals were recorded on an infrared trail counter at the Gate Butress trailhead, indicating the high level of use of this property for the general public's enjoyment. This number does not include all users who accessed the property during that time. Some were parked alongside the road and used side trails to access the climbing resource. Further, congestion is compounded in this area due to the parking at the large pull out adjacent to the pipe bridge to the east on the southside of the highway. Without overflow parking and/or a viable bus or shuttle option, recreation access would be severely limited if roadside parking is eliminated in this area under the current parking lot design. Again, parking needs in this area must be fully analyzed. The proposed 21 sites and no roadside parking within a quarter mile of the Gate Butress is not adequate for current use let alone for increased future use. There must be public transit options. Leaving the Gate Butress lot unimproved allows for more parking than what is potentially proposed.</p>	Brad Barlage	Website
6308	<p>I am lifetime resident of the Wasatch front and have built my life and livelihood around time spent outdoors year-round. I am disappointed that UDOT chose to remove itself from more holistic and collaborative efforts to solve transportation issues in the Central Wasatch canyons such as CCTAP and other efforts in conjunction with the Central Wasatch Commission. The choice to do an EIS that looks at Little Cottonwood Canyon in isolation instead of as part of a system with the other canyons, and that places such priority on getting people to ski resorts over other dispersed usage just seems too short-sighted and narrow focused to ever create a truly effective solution. (Particularly given that resort usage makes up only 30% of visits to the tri-canyon area, and with the remaining 70% being dispersed usage... and of that total; 32% of usage being dispersed in LCC and about 17% being at LCC ski resorts.)</p> <p>With that said, of the available options, I support enhanced busing with no widening of Highway 210 as the best transportation option to alleviate traffic issues in LCC. Specifically, I am in favor of using low -or zero-emissions busses and vans on the current LCC road with no, or minimal, additional construction. This option has the lowest environmental impact, is an inclusive transportation system that serves dispersed users, has the lowest cost, and is the quickest way to solve the traffic issues in LCC. This option would be significantly more effective if it also included optimized bus service up the canyons (not just LCC) from transportation hubs all over the valley in addition to near the mouths of the canyons, and could potentially include additional incentives to use transit or carpool, such as tolls for vehicles with less than 4 passengers.</p> <p>LCC is an important part of the Salt Lake City watershed so it is important that UDOT pursue a traffic solution that has the lowest environmental impact. Expanding the road or installing and maintaining a gondola will have a far larger environmental footprint than simply utilizing energy-efficient mass transit vehicles on the existing infrastructure. Additionally, buses and vans can provide year-round transportation to trailheads, serving dispersed users year-round, such as backcountry skiers, hikers, climbers, runners, and mountainbikers. In contrast, a gondola will not stop for people at backcountry trailheads and, as proposed, would not be a year-round solution. Enhanced busing is also the most convenient option for the public, and convenience is critical to ensuring the public actually utilizes the chosen transportation solution. And, as described in the EIS, enhanced bus service is the lowest cost option, coming in at a significantly lower price than either bus service with a peak period shoulder lane, or a gondola.</p> <p>As lifetime user of the canyons; I urge you to consider how each alternative will affect, and serve, dispersed recreation users in addition to resort visitors. A considerable amount of the traffic in LCC in both summer and winter is people heading to trailheads to backcountry ski (in winter) or hike and mountain bike in summer. The transit system must include stops at trailheads in order to serve backcountry recreationists. Likewise, the transit system needs to originate at multiple locations around the valley so that people can access it where they live, rather than drive their car to a distant mobility hub (in which case, they'd likely stay in their car and continue the drive up LCC, not utilizing the transportation solution).</p> <p>Enhanced busing with no widening of the LCC road is a solution that can be implemented almost immediately and have a significant effect if it is done in a way that incentivizes transit use and by making it easy to take transit from hubs all over the valley, incentivizing carpooling by tolling vehicles that aren't full of passengers. There is no need to wait years to construct additional, expensive, infrastructure when we can solve the traffic issues with the infrastructure that is already in place.</p>	Carston Oliver	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6310	<p>From John Ries PE</p> <p>I have been involved with the planning, design and construction of all types of civil engineering projects including roads, freeways, sewer/water and storm water utility lines, sewer and water treatment plants etc. I'm also an avid hiker in big and little cottonwood canyons as I live in Cottonwood Heights.</p> <p>I have looked over UDOT 's Environmental Impact Study which I received yesterday (7/9/20). It would take several hours to give a detailed review so here are some of my first observations.</p> <p>The study is quite extensive and a lot of great work has gone into it but it doesn't seem balanced in that it's mostly deals with traffic and not the overall health, beauty, and year around use of the canyon. The canyon is not just for skiing and hopefully broader issues will be address later.</p> <p>The Gondola option seem off-the-wall and not practical to me. It won't really help traffic flow much and maybe create massive traffic problems in front of Big Cottonwood Canyon. It seems like a very expensive novelty project that looks bad and won't solve the problem.</p> <p>The avalanche sheds will not look good either and seem like an extreme solution for just a few days out of the year. So, the road to the ski resorts maybe closed for 4-5 days a year, that is just one of the hazards and realities of owning a ski resort in Little Cottonwood Canyon. Don't destroy the natural beauty of the canyon just to get a few skiers on the slopes in really bad weather. To me avalanche sheds are not a practical common-sense solution for the overall use of the canyon.</p> <p>Road improvement: More parking lots and bigger parking lots are needed in some areas and the UDOT study addresses this. The size and locations need to be reviewed by users of the canyons not just dictated by UDOT.</p> <p>Adding more traffic and/or passing lanes in some areas will need to be done and makes sense to me. The UDOT study addresses this.</p> <p>Improving and expanding our bus system seems like the best solution. In addition to the proposed large mobility station just north of Big Cottonwood Canyon consider building or utilizing existing terminals in the Sandy/Draper area and one close to down town SLC or even in the central part of the valley that would have direct bus service to the ski resorts during peak traffic flow.</p> <p>My compliments to UDOT for this initial impact study. It has put a lot of good ideas on the table. Now is the time to improve and perfect the project.</p> <p>I realize implementing changes like this takes time and lots of negotiations between all involved. I hope UDOT will be open for detailed review of this impact study so the end result will be a win/win for all involved. That includes local residents, businesses, canyon users and the long-term future of the canyon. Let's not make a short-term decision but consider what we want the canyon to look like and be used for in 50 to 100 years from now. The Wasatch canyons are unique and special. It's time to think long term...not short-term.</p>	John Ries	Website
6311	Option 1. No gondola and No road widening, just add more busses.	Ian Brown	Website
6312	As a Sandy resident and someone who has been recreating in the Wasatch for over 10 years, I am conflicted on which option provides a more viable future for the traffic concerns in LCC. I am deeply concerned about the environmental impact and degradation associated with widening the LCC road. I am concerned at the limited scope of the gondola and the fact that it is entirely serving two private businesses at the top of the canyon in Snowbird and Alta while completely ignoring many other use groups. Given the information provided, I favor the Enhanced Bus (No additional roadway capacity in LCC) option. Coupled with the snowsheds, transit hubs, and priority on Wasatch, the buses should be a good alleviation of some congestion. The linchpin of this entire operation will be the management of private vehicles and occupancy. The single-occupant vehicle, particularly on weekends, just isn't sustainable anymore. I'm as guilty as the next person on driving solo up to the resorts or trailheads, but if a more realistic and dependable bus service existed, I would favor using that transit option. My biggest struggle with the current busing situation is that the bus departures are much too infrequent, have a lack of service mid-day, buses tend to be very full (causing additional wait time), and that the buses get stuck in traffic just like everyone else. The bus priority on Wasatch should alleviate some of that busing delay. I am in favor of a toll for private vehicles going up the canyon. This will provide additional incentive for carpooling, particularly if there was a tiered system based on number of occupants.	Mitchell Hymas	Website
6313	<p>Dear Sirs,</p> <p>Before you make big changes on Wasatch Blvd between Big and Little Cottonwood canyons you need to have completely determined what you are doing in Little Cottonwood Canyon. You could make a 10 lane road along Wasatch Blvd but it would still be a parking lot during ski season because of the restrictions at Little Cottonwood Canyon. From what I have learned I believe the best answer to access the ski resorts would probably be with a gondola system. It seems to work all around the world. I have seen it work wonderfully well in China. Providing transportation to the gondola through buses etc. could alleviate the need or concerns for widening Wasatch Blvd. The best thing would be to make Wasatch Blvd more neighborhood friendly along the lines of the Cottonwood Heights City plan.</p> <p>If the main concern is for commuters it would seem proper to complete Highland Drive first and see what relief would come from that. There isn't much development east of Wasatch Blvd so it makes more sense to put a commuter road a little further west at Highland Drive. That is what the Salt Lake County master plan called for many years ago. Wasatch Blvd needs to be tweaked some but not made wider when there are alternatives that are much better for the community surrounding it and for the future in general.</p> <p>As always, I am very willing to share some of specific ideas I have (noise, speed, traffic lights etc.) once these larger issues are addressed as I have done the past few years at the meetings regarding Wasatch Blvd.</p> <p>Mel Young</p> <p>P.S. FYI - I have lived in a home since 1979 that backs onto Wasatch Blvd. I own three properties that have combined over 300 feet of frontage on Wasatch Blvd.</p>	Melvin Young	Website
6314	<p>1. A toll for single-person cars could be implemented.</p> <p>2.Snow sheds should be built under avalanche paths no matter what alternatives are employed.</p>	Bronze Black	Website
6315	<p>As a year-round canyon user, I'd like to see a plan that works in both summer and winter. Enlarging the roadway would be beneficial for summertime runners and cyclists- of which there are many! Summertime weekends in the canyon can be quite congested- I think that should be considered in the plan. A gondola would be great, but driving to a mobility hub to take a bus to the gondola is untenable; to encourage usage parking should be at the gondola, as with the LaCaille proposal.</p> <p>Increasing bus service without expanding roadway capacity is really just ignoring the problem. Ultimately I think we need both an expanded canyon road (driving up at 8am on a Saturday gets more dangerous every year with the number of runners and bikers) and working public transit, of which a gondola seems like the most environmentally friendly proposal for the long term.</p> <p>Finally, these proposals are all for the future. What is going to be done now, when the canyon is crowded every weekend year-round?</p>	Shannon Gallagher	Website
6316	<p>Dear Sirs,</p> <p>Please don't widen Kings Hill Drive as you show on the alternatives. May I please address my concerns with someone who will listen before you do something that I think is totally unnecessary and probably even stupid not to mention a waste of money. I have used the intersection at Kings Hill Drive and Wasatch Blvd daily for over 40 years and I know a few things about it.</p> <p>Thanks,</p> <p>Mel Young</p>	Melvin Young	Website
6317	<p>Hey all,</p> <p>I would like to echo some concerns that this is not addressing the root of the issue, which is more vehicles in the canyon. To me the main goal needs to be restricting the number of vehicles in the canyon. Right now this is untenable with our lack of efficient public transit to the resorts. Instead of altering the canyon to allow more vehicles or a gondola, why not push for investment into smart, efficient public transit that mitigates transfers and makes it an attractive option to commute.</p> <p>Best,</p> <p>Brett</p>	Brett Hinman	Website
6318	<p>Ladies and Gentlemen,</p> <p>PROPOSED LITTLE COTTONWOOD PLAN</p> <p>I have watched this process for many years, and have been very aware of the congestion on Wasatch Blvd. as I live in the neighborhood next to it. I appreciate the many hours of discussion, consideration, arguments, and compromise that have gone into this plan.</p> <p>To Address your Question Simply: My vote is to increase bus service, and have the availability of the shoulder lane for bus only use in the winter. I also am highly in favor of mobility stations that are scattered around the valley so that the mouth of the canyon does not take all of the wear and tear. It also allows the city to share the down side of increased car parking, but the up side of taking skiers to many parts of town to eat, dine, and stay in hotels etc. It removes many cars from the street who are traveling to the mountain areas.</p> <p>I am also in favor of limiting personal cars to multiple passengers only, and to incentivize this, I suggest having increased tolls for any single passenger car. I AM HIGHLY IN FAVOR of having rental or out of town cars pay tolls to use the canyons. Enough tolls to pay for repairs, parking, and snow removal!! This is our state, it is NOT for sale to tourists. Especially when the ones who benefit from the profits are the Resorts, and not the people of Utah. Car owners in Utah should have a sticker on their license plate that allows for lower tolls, lower parking etc., but everyone who uses the resource, should pay for it.</p> <p>I am absolutely opposed to the option of signage and barriers on Wasatch Blvd. People come to this part of the world to see the beauty, NOT the signs and concrete. Go visit the ALPS or any European area with similar resources and see preservation. Salt Lake does not want to be the next Vail or Telluride. We don't want Disneyland in the tops of our mountains.Sometimes the reality is that a resort has reached its'capacity for a day, instead of Utahn building bigger and bigger. Why should we take on this financial and environmental burden?</p> <p>On your proposal you have down-played the environment impact of building the Gondola, which would be extreme. You also down play the environmental impact of building the extended shoulder. You down play the environmental impact of signage.</p> <p>This is a plan for 2050, that's a lot of years of driving around construction zones etc.</p> <p>THE BIG CONCERN: is hardly mentioned in your proposal. When all of the trails are beaten down thru over use, and people have created new trails here and there, when all the available parking lots are full so that people park everywhere, when all of the amenities have been added to accommodate these many visitors, WHAT real impact will be the results? There will be less ground cover because it has been trampled down, parked on, or paved over. Less ground cover will mean less foliage to hold soil in place, which means more and more erosion. Erosion leads to the loss of the most fertile soil to nourish the canyon. There will be less ground cover to renew older plants and nurture new plantlife. Less ground cover as habitat and food for many many species of wildlife. Less ground cover to be beautiful, to cool the earth, to hold and retain water, to renew life.</p> <p>THE BIG QUESTION is not how do we accommodate the skiers! The QUESTION is how do we insure that we have water flowing down to the many citizens of the Wasatch front. If we lose the resource, we won't get it back.Everyone in Utah drinks waters, relies on water. Many Utahns have never, and will never ski, or even hike. First things first. All Utahns will pay for the Little Cottonwood Plan thru taxes, but only a small number will access it. However, they will all require the life giving water. It's not always about money.</p> <p>Thanks,</p> <p>Kathy Schmidt</p>	Kathy Schmidt	Email

6319	No! To your present plans to widen Wasatch Blvd and create a catastrophic, ill effective "gondalla" system of transportation through our canyons. No. Celeste Kelly	Celeste Kelly	Website
6320	If UDOT wants to keep commuters from Sandy, Draper, Cottonwood Heights, and other communities within this area of the valley moving, they, in conjunction with UTA, need to look at offering enhanced public transportation options for residents of these cities first before irrevocably changing the landscape of our community through road widening and parking lots. As a former resident of Sugarhouse, I saw first hand what enhanced public transit and increased bike and walking trails do to a community. I saw how the S line streetcar and increased walking and biking trails not only alleviated car traffic but increased property values in my community. Now that Cottonwood Heights is my home, I have loved the access to the canyons and bike lanes that this community affords. But have seen a huge lack in public transit services. UDOT has ruled out public transit as a viable solution to accessing the canyons, but that would be akin to UTA saying that the S-line street car wouldn't work in Sugarhouse. You can't discount something unless you have really tried it in our community. Knowing that the quarry site will be developed, let's focus our attention on that as a good spot for one transportation hub with enhanced shuttle services, walking and bike trails, even perhaps a resort hotel. But just focusing on one section in this quadrant to relieve congestion from traffic coming from all directions in the valley doesn't make sense either. Looking at other additional transportation hubs that have express services to the canyons will help even more. Before spending hundreds of millions of dollars to forever bulldoze down Utah's pine-tree lined gateway to Big and Little Cottonwood Canyons, to create a high-speed arterial, let us REALLY explore public transportation coming from many different directions. It is not only more cost effective, better for the environment, and better for the health of the community, but serves to enhance property value instead of decreasing it. RE Wasatch Blvd Expansion: I live in Cottonwood Heights, just off of Wasatch Blvd, and am an avid cyclist who rides on Wasatch and both BCC and LCC on a regular basis.	Madeline Melini	Website
6321	UDOT's Imbalanced-lane and Five-lane Alternatives are unacceptable because they are based on encouraging high-speed through a residential area which includes eleven residential intersecting streets. 12-foot wide lanes and straightening of roadway are the wrong measures to take as they will create higher speeds, more air/light/noise pollution along with higher danger and fractionalizing of the Cottonwood Heights community. A desirable roadway through this residential strip includes no more than one lane in each direction with either one REVERSE LANE or two additional lanes for BUS TRANSIT/HOV ONLY. Current and foreseeable future vehicular use does not warrant an expansion based on new commuter trends driven by Covid-19 pandemic, virtual officing, incentives for workers to live near where they work, projected housing growth focused on the west and central valley, and a projected new business epi-center located at the south/central valley area replacing previous prison space. More analysis is needed regarding egress/ingress lane design and associated roadway width on the additional six residential streets excluded from the LCC EIS.	Lisa Hamann	Website
6322	I would love to see Wasatch Blvd widened between BCC and LCC to allow for a dedicated bus lane to bypass car traffic. I do not support widening Little Cottonwood Canyon Road itself since this would be excessively costly and disruptive to the environment we are trying to maintain and protect with this project. Thank you!	Amy Jenness	Website
6323	I'm in support of the gondola, however my concern is how much it will affect the ticket prices which are already extremely high with no discounts of any substance....???	Valerie Young	Website
6324	As a lifelong Utah resident and an avid skier and adventurer at the young age of only 17, little cottonwood canyon has become a special part of my life. Hitting the slopes since the age of 3 and gloriously partaking of the Utah powder has become a ritual of my youthful winters. As time has gone on, the affects of little cottonwood canyons outdoor and natural resources on the canyon have become apparent. I fully agree that something must be done to help the flow of traffic through the canyon. Although all options proposed are not going to completely alleviate the stress on the Canyon during busy months, I strongly believe that the proposed gondola solution to be the most effective and more importantly most environmentally friendly option. I would be distraught if the Utah transportation organization made the mistake of harming our canyons with the other proposed solutions. Although it is difficult to have a voice—especially at such a young age- in such a large decision I would hope that the state of Utah and it's transportation executives would take my thoughts on this matter seriously. Thank you for finally bringing solutions to the table for this issue, and I hope we can all work together to make a better Utah for tomorrow.	Xander Later	Website
6325	As a lifelong Utah resident and an avid skier and adventurer at the young age of only 17, little cottonwood canyon has become a special part of my life. 6326	Traffic Calming RE Wasatch Blvd Expansion: UDOT's Imbalanced-lane and Five-lane Alternatives are unacceptable because they are based on encouraging high-speed through a residential area which includes eleven residential intersecting streets. 12-foot wide lanes and straightening of roadway are the wrong measures to take as they will create higher speeds, more air/light/noise pollution along with higher danger and fracturing of the Cottonwood Heights community. A desirable roadway through residential strip includes no more than one lane in each direction with either one REVERSE LANE or two additional lanes for BUS TRANSIT/HOV ONLY. Current and foreseeable future vehicular use does not warrant an expansion based on new commuter trends driven by Covid-19 pandemic, telecommuting incentives for workers to live near where they work, projected housing growth focused on the west and central valley, and a projected new business epicenter located at the south/central valley area replacing previous prison space. More analysis is needed regarding traffic calming design and whether that will fit into existing space without removing houses within the road section that includes eleven-residential streets within the Cottonwood Heights city boundaries. We have lived at the mouth of Big Cottonwood Canyon for over 25 years. Through time we have been ring side for all changes on Wasatch Blvd. Wasatch was only one lane in each direction, ending at 90th south when we came here. Traffic noise was not too bad nor was road dirt. We couldn't see the gravel pit, although we could hear it. But it seemed far away. (different issue)	Lisa Hamann	Website
6327	Now the road goes all the way to Draper and has several lanes open to Bengal. (Looks like there were already plans to widen even then). Road noise is awful as is the dirt. We can no longer plan to sit outside on our deck except on rare occasions, like early Sunday morning. What I'm saying is that the road going past my house is already similar to the proposed plans. And its noisy, dirty, and crowded. The canyons are at capacity from the looks of the daily traffic. I don't see how this road plan can possibly alleviate that conestion. There is some commuter traffic a couple times a day, but, only for a short time. Then the traffic flow is steady for the rest of the day. Cars are able to go the 50 mph with little issue. I would only, hesitantly, support a bus lane. And then, only for the snow season traffic. The parking areas for Big Cottonwood canyon are well used for snow season. And all those people use the ski bus. With more parking available and, if needed, an additional bus or two the canyon road might not be as busy.	Canmdace Bastow	Website
6328	I support considerations to enhance bus/shuttles. I do not support roadway widening or a gondola. I would like to see current access to trailheads and recreational opportunities to stay the same, and I believe roadway widening or a gondola would severely impact this. Little Cottonwood Canyon is special - a unique area of nature, recreation, and history within a 20 min drive of so many people. I would like to see this preserved as much as possible. Would a toll fee or seasonal pass be considered as an option to help with this? Money could go back into the canyon. — MORE BUSES AND A TOLL will greatly reduce traffic at MINIMAL EXPENSE. and solve this issue. —Living in the triangle between between the Little Cottonwood Rds, we are well aware of the traffic problem ... or lack of. Usually less than 10 DAYS A YEAR. —This is a RARE problem... hardly worth millions and millions of taxpayer dollars. —It is a money grab by UDOT. —Most of your solutions seem to INCREASE THE BOTTLENECK at the mouth of the canyon... with MORE LANES ON WASATCH reducing to go up the canyon. —Any structures should be moved WEST OUTSIDE THE CANYON. —Please use a TOLL to increase mass transit usage and carpooling.. reducing traffic. —PLEASE PRESERVE OUR CANYON! PLEASE NEVER CARVE INTO THE MOUNTAIN. Why not build a parking structure at the former ShopCo for a HUGE SAVINGS\$\$\$\$ And preservation of the eco system of our narrow canyon. —Forcing more transportation up the canyon will DESTROY IT. IT IS NOT BIG ENOUGH	Bess O'Brien	Website
6329	More analysis is needed regarding the effect of fracturing the approximately 8,000-resident Cottonwood Heights community with a high-speed roadway.	Anna Marie Neider	Website
6330	RE Wasatch Blvd Expansion: UDOT's Imbalanced-lane and Five-lane Alternatives are unacceptable because they are based on encouraging high-speed through a residential area which includes eleven residential intersecting streets. 12-foot wide lanes and straightening of roadway are the wrong measures to take as they will create higher speeds, more air/light/noise pollution along with higher danger and fracturing of the Cottonwood Heights community. A desirable roadway through a residential strip includes no more than one lane in each direction with either one REVERSE LANE or two additional lanes for BUS TRANSIT/HOV ONLY. Current and foreseeable future vehicular use does not warrant an expansion based on new commuter trends driven by Covid-19 pandemic, telecommuting, incentives for workers to live near where they work, projected housing growth focused on the west and central valley, and a projected new business epicenter located at the south/central valley area replacing previous prison space.	Lisa Hamann	Website
6331	I am a regular year-round LCC user and resident of Utah. I am strongly against any solution proposed aside from the enhanced bus system proposal. Either of the two other options would require massive cost and stress upon our local environment including the local watershed at the detriment of the citizens of the Greater Salt Lake area. These expensive proposals only serve the ski community, and even then these will cause more harm than good. Please do not build, but enhance the ease and accessibility of the bus system. I think the enhanced bus is the best option moving forward. This is the only option that dramatically reduces travel time and therefore directly incentivizes using a public transit option. Using busses has the added benefit of scaling to meet the specific need of the season and day of the week rather than a binary all-or-none service. Busses are already highly utilized on busy days and are ideal for individuals who would otherwise drive the canyon in their single occupant vehicle. Unfortunately, busses are not currently prioritized in any way and passengers would rather sit in their own car over the bus if the time to get to the resort using both means are equal. Busses need to be consistently given priority and the enhanced bus route is the best way to do that. On one powder day this past year the road was closed for control work and it took us about 2 hours slower to ride the bus than if we were to drive our personal vehicle since the busses were held at the 9400 South park and ride until they received confirmation that the road was open, then they were stuck at the back of the line! Having the drastically reduced travel time afforded by the enhanced bus means that canyon users are willing to be inconvenienced in order to arrive at their destination sooner. Bus service starting from 1-3 transit hubs would allow better connections to UTA infrastructure in the valley and more flexibility for future growth in the number of transit hubs and the frequency of busses as the population continues to increase. It also can serve canyon users arriving at the canyon from multiple directions. Busses also have more opportunity to serve canyon users other than those going to the ski resorts.	Paulina Popovskaia	Website
6332	To accommodate the multiple types of users for the canyon, there could easily be "express" busses that go straight to a single resort and less frequent busses that stop at trailheads or locations not served by the express bus. A gondola serves only the ski resorts. It is an eyesore for users who are hiking, climbing, and biking. It would be a mess to off-load passengers in the event of mechanical problems. Logistically, the gondola is much more complicated than taking a bus from a transit hub and requires a transfer. At the mouth of the canyon, getting to the gondola via bus would be burdensome, especially for people coming from the south. This complication adds extra time (projected as almost double the time to take a bus in the enhanced bus option) and includes a lot more standing in various lines making the canyon feel more like a busy day at Disney world than a trip into the mountains. I think this would serve as a novelty for some visitors, but locals would get fed up quickly and resort to driving their vehicle up the road. It is also unclear if the calculation for time on the gondola option, which is already the longest transit time, includes time stuck in the traffic jam that would form by people trying to park at the garage. In addition to calculating transit time for LCC, I think it would be important to include how these changes would influence users trying to get to BCC, even on days when BCC is not closed for control work, the base of the canyon can be very busy with traffic backed up. This plan just displaces the traffic from LCC and increases the burden in the area that is already overwhelmed around the base of BCC.	Rebecca Goldstein	Website
6333	The gondola option looks fantastic. This seems like a civilized way to get up to Alta and Snowbird in any weather. As a visitor to Utah I think this would be a great option for out-of state skiers to avoid the drive up Cottonwood canyon.	Paul Gibbs	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6334	As a resident of the Little Cottonwood Canyon neighborhood, I am strongly against the installation of an inefficient and expensive gondola in the canyon. My entire family skis at Snowbird resort and regularly deal with traffic going into the canyon on winter ski days. I understand that there is a problem with access, but none of the proposed solutions fully addresses this problem without sacrificing some of what is critical about this canyon - the natural beauty and vital watershed resource. I was very disturbed to discover that the locations of the proposed parking and gondola base were recently altered, making it very likely that a gondola would go directly over my home and currently very secluded and private lot. I did not invest in land in this canyon so that my home could be turned into part of a very slow and expensive amusement park ride. Also, because of the location of this hub, the issue of traffic into the canyon will in no way be improved as skiers from all surrounding communities will still need to drive to the canyon in order to access the gondola. Also, because of the time involved in driving to the canyon or to the transfer station, transferring to a bus, riding to the gondola, unloading and reloading plus the lengthy ride to the resorts, I do not believe many people will do this on a regular basis as it will be a 1.5-2 hour trip for those in SL County. The gondola will likely only see widespread use during the 10-15 days of canyon closure each year, which cannot justify the cost, environmental impact and the disruption of our lovely neighborhood. Of the proposed solutions, the most palatable one is enhanced bus service, though it will be important to increase service from other areas in the SL valley so that there can be an actual reduction in cars driving to or near the canyons.	Lindsay Butrum	Website
6335	I support the enhanced bus system and I vehemently oppose widening Wasatch boulevard. I have lived in this neighborhood for almost 20 years and the speed and traffic on Wasatch are already too much for a residential area of this nature. We need to get more cars off the road and invest in public transportation! No gondola no road widening no high speed highway in our neighborhood !	Suzie Ellison	Website
6336	I don't believe the proposed solutions for Little Cottonwood Canyon adequately assesses the impact on preserving the wilderness and the natural beauty of this canyon. Solutions such as a bus route outside of the canyon, as Save Our Canyons has proposed will allow the canyon to maintain its natural beauty, wilderness, and a true place to enjoy outdoor recreation at its best without taking away any of the aforementioned attributes of LCC. Please believe in the beauty of the Wasatch Front as we do and work towards solutions that don't exploit our communities backyard but preserves it for generations to come!	Bryan Quigley	Website
6337	Dear UDOT, Please, never EVER put trains up the Cottonwood Canyons. The cost is too high, the impact too great, and it destroys too much for too little. The people of Utah should never provide a financial solution to the private industries of Snowbird, Alta, and related businesses. The solution to the Cottonwood Canyon problem is to REDUCE the number of people in the canyons. Just because we CAN get more people up the canyons does not mean that we should. I believe in reducing the number of people, eliminating cars, and increasing nonpolluting buses. Thank you very much, Rich Wyman	Rich Wyman	Website
6338	More FREE buses especially at peak times (with ski racks on the outside) would be the best solution to this problem. The buses are always packed, never on time, not enough parking at park and ride. Have convenient times to ride up in the summer stopping at Lisa falls, red pine/white pine trail head, snowbird and Alta for adequate trail access. WE DONT NEED TO DEVELOP LCC ANYMORE	Lauren Stephenson	Website
6339	Please prioritize buses and snow sheds. The roads are already in place and further development should be limited. Frequent buses would be a great place to start for a solution. The gondola is an awful idea which would require multiple transfers from ones car to a bus to a gondola to a resort then to a lift. Would not make skiers want to ride it. Instead it would only bring an additional type of tourist. No gondola	Chelsea Phillippe	Website
6340	To reduce environmental impact in the canyon and negative impact of increased traffic on local residential neighborhoods I do not support widening of Wasatch or LCC. A year round public transit system with stops at both resorts and trailheads with enough capacity to serve the need along with links to other local transit and parking is the best solution.	Maggie Israel	Website
6341	My wife and I live in Little Cottonwood canyon and we would support the gondola proposal. Also at peak ski days, we can't get back to our house on Rt. 209 because of ski traffic backed up along the road. Traffic should not be allowed to park along the road from Wasatch to Rt. 210. Also we would ask that the completion of Highland Dr. At 94th So. To 117th So. should be completed first to take pressure off of Wasatch Blvd.	walter widmer	Website
6342	My name is Zac Ramras and I am a Salt Lake Local. I have grown up in the valley and have watched this place grow immensely over the years. I am now raising my daughter in the Wasatch Mountains, as I was, taking her skiing at Alta almost every weekend. I am not blind to the growth and change and understand that it is inevitable and we need to prepare for the future. That being said I am quite disappointed in the options that have been presented in the draft alternatives. Two of the three options include major changes to the environment in the canyon. The gondola doesn't offer any benefit to hikers, bikers, and climbers in the lower canyon. Additionally the users experience requires more transit transfers and takes more time to get to the resorts and doesn't get as many users to the resorts during peak hours. The gondola is definitely the worst option of the three. The enhanced bus option is the simplest and cheapest for taxpayers. It relieves congestion in the canyon without putting major eye sores and affecting the watershed in the canyon, one of Salt Lake Primary drinking water sources. I would like to ensure that the options moving forward offer more year round canyon usage and not simply benefiting the ski resorts. These canyons are our most prized possessions, and bring massive amounts of revenue to the state. People come from around the world because of their beauty and serenity. If we build snow sheds and/or gondolas to increase the revenue for two ski resorts, that only are really impacted 10 days of the year, we will sacrifice the environment and will never be able to undo that mistake. Europe did it, concurring every mountain in sight. Look at them now, they've lost the wildness of the place. We have the opportunity to protect these mountains and learn from past mistakes and keep the landscape pristine for future generations to marvel in their beauty.	Zach Ramras	Website
6343	My name is Julian Carr, professional skier & founder of Cirque Series & Discrete. I frequent Alta/Snowbird 70+ times each winter. The canyons need bigger parking lots at the mouth of each canton, more buses & a handful of small avalanche mini half tunnels. Simple. WE DO NOT NEED gondola. Thank you -julian	Julian Carr	Website
6344	Hi, As an avid climber in little cottonwood my biggest concern with the road development is that it would wipe out some of the roadside boulders. These have been around for decades and are significant to the climbing community. Another big concern is parking. During the winter, I am concerned with preserving parking for ice climbing in the canyon. I think this is important to keep in mind. All in all I am not a big fan of the road widening. I think the tram is a significant amount of money that doesn't make sense compared to an enhanced bus service. I think providing more hubs throughout the city could really work! One of the biggest current problems I feel with the bus system is that there simply is not enough space. By spreading it throughout the city, not you decrease the long commute time to the bus service at the base of the canyon but it will be a lot cheaper to find space. This solution seems way more reasonable than a gondola. Also, from an aesthetic point of view a gondola ripping right through the center of the canyon is not ideal. Thanks!	Nick Fontaine	Website
6345	Best, Nick		
6345	We don't want a highway in our backyard! Neither does the wildlife that lives here or the environment in general. Why does the planet always have to suffer to cater to the people? If we don't start catering to the planet, none of us are going to be here anyway. How about you figure a way to limit the number of people who go up the canyon per day?	Jane and Shaun Saylor	Website
6346	Enhanced bussing with no expanded shoulder. The other alternatives will have significant negative impact on common year round forms of recreation in the canyon.	Chris Grosh	Website
6347	Option 1 has the least environmental impact and that should be the priority for our watershed.	Maggie McCormick	Website
6348	I am strongly opposed to the gondola option. Especially the la Caille base. This is a last minute addition that has not been fully vetted. Further study of this proposal is certainly required.	Matthew Butrum	Website
6349	The Gondola option seems like a bad idea. Gets cars off the road but is slow, expensive and offers limited canyon access. It is also inflexible. I'd love to reduce vehicular traffic but increased bus service and wider or more lanes makes more sense. Thank you for your work on this.	Mark Schneider	Website
6350	I support a well thought out and designed gondola to reduce the congestion in Little Cottonwood Canyon. This might be a way to mitigate traffic conditions during blizzards when the road is too dangerous to allow downhill traffic. We also need to be vigilant when determining which vehicle are prepared to travel up the canyon when a large storm has been forecasted or is underway. Most issues I have observed in the canyon after over 38 years of driving Ut-210 in many condo. If only appropriately equipped vehicles are permitted up or down the road during a storm, this would relieve traffic pressure of vehicles.	Jason Ehrhart	Website
6351	As a resident, parent and active community member of Little Cottonwood Canyon, I am against Udots proposals for a Gondola and build throughout the canyon. This build will negatively impact the local environment, wildlife and residents for many generations to come. Please reconsider options such as adding additional green buses.	Eliisa Valenzuela	Website
6352	Please please please consider cycling safety and access with whatever plan moves forward. Wasatch is a primary thoroughfare for cyclists who commute or who are cycling for exercise, and riding next to traffic at 55+ MPH is certainly a danger to cyclists. Also, please ensure that cyclists have access to the canyons year-round--there are often late winter periods of time when there is no snow and conditions are good for cycling. The canyons are vital because they provide, in general, a safer place for cyclists, out of the valley which has a lot more danger due to frequent intersections and interactions with cars. Please, I beg that you consider the needs of road cyclists when implementing any of these plans.	Anne Findlay	Website
6353	This process has not been fully transparent. Changing the proposed location for a gondola, as well as the transportation hub during the public comment period is unethical. A new process should be initiated with data on traffic and environmental analysis related to the La Caille location and the gondola base proposal. Announcing this change in a memo 2 days before the end of the comment period is subversive and negates any of the previous feedback received from the public.	Lindsay Butrum	Website
6354	Option 1 only please. Climbers would lose so much recreational access Please put more consideration into prioritizing busses and a shuttle system in Little Cottonwood Canyon. A gondola would drastically change the experience of being in the canyon as someone that hikes and snowshoes and goes to the canyons for respite in nature. The gondola system seems to only serve the ski resort users and possibly mountain bikers, and does not offer any stops but Snowbird and Alta, while utilizing the entirety of the canyon for its development. I beg you to please consider alternatives that benefit all users with minimal impact to not just the roads and parking, but the experience of enjoying nature without man-made developments running through and above our trails.	Amy Fruge	Website
6355	I would favor a transportation system that prioritizes busses and a shuttle system that stops at trailheads, not just the resorts. I would additionally appreciate partners coming together to do the following: 1. Incentivize utilizing the shuttle and/or bus system with more frequent service from a bus only lane, discounted ski resort passes, more parking at the base of LCC, and more ski bus service throughout the metro area. 2. Disincentivize driving personal vehicles up the canyon, especially during the winter season. Currently there is no charge for parking in the canyon for any user. There needs to be a toll, parking fees at the resorts, and heavy fines and towing for anyone that parks alongside the road.	Michelle Ludema	Website
6356	I appreciate your work on these alternatives to alleviate traffic in our canyon but please let the final decisions be based on the greatest benefit for all users that enjoy our national forest year-round including those who recreate outside of the for-profit resorts. A robust bus and shuttle system has greater potential to do so.		
6356	I think increasing bus service and increasing parking at the base is the best solution to the traffic. I also like the idea of having a toll both on the way out of the canyon similar to Millcreek for cars that have only single occupancy. I think the gondola is a poor idea. I believe that building lifts and gondolas cut into the natural beauty and habitat of the area. Especially in the 7 months a year that it isn't running, it becomes a giant man made eyesore. Please do not build a gondola.	Jack Ogden	Website
6357	I strongly support the proposed gondola with the la caille base station. Having a gondola provides a consistent, dependable option up the canyon that while may take longer than busses in a best case scenario, is far quicker in a worst case (or even average case) scenario, won't close due to weather, avalanches, or accidents, and will provide ample capacity to serve LCC for generations to come. The added parking garage vs the original suggestion will encourage many more users to take the gondola as the dependency on transit will be reduced and people will be more willing to travel in their own cars to a system with a continuous and reliable schedule and timing vs having to be subject to the whims of the bus system. For all these reasons, I strongly support the gondola with added base station and encourage UDOT to select and construct this alternative.	Spencer Aronstein	Website
6358	No Toll Roads Millcreek Canyon did the toll roads and this is what we got: They lock up the canyon until July 1st. The money goes to a private company. Rates went up about 40% this year and nothing in the canyon is better. Expand the road as needed and allow parking areas along the road and stop taxing ridiculous costly ideas. Alta ski lift company stated that they would pay for a gondola over to big cottonwood canyon. If so, why should we pay for the resorts?	Edd Decker	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6359	I am vehemently against the gondola. It is terribly inefficient and a thinly veiled first step to interconnecting canyons and ski resorts, which was always a terrible idea. I urge you to expand busing as much as possible, prioritizing access to the buses for as many people as widely across the valley as possible. This means affordability and expediency.	Adam Laurenzo	Website
6360	I have concerns that all 3 alternatives cater only to the ski resorts and their clientele. I would like to see the buses stopping at backcountry trailheads and I would like to see them cheaper than driving to everyone, not just season pass holders. PLEASE THINK ABOUT THE CLIMBERS OF LITTLE COTTONWOOD!!!! All of these projects have avoided thinking about the climbers and boulders in this canyon. These boulders are sacred and beloved by thousands and thousands each season and are life long loves for all sic and utah residents. PLEASE PLEASE RECONSIDER AND THINK ABOUT THE IMPACT OF THE CLIMBING OF LCC.	Jacob Nolan	Website
6361	My principal concerns with accessing Snowbird and Alta using the Little Cottonwood Canyon Road are traffic congestion and parking, delays due to avalanche control work, and road safety issues arising from avalanche and other drivers' behaviours on icy roads. I live in Australia but make the pilgrimage annually for a 3 week ski holiday at SLC or Snowbird and have done for the last 15 years. Prior to settling on Snowbird/Alta as my resort of choice, I used to ski mainly in France, and experienced various non-road alternatives to access resorts, eg the funicular railway from Bourg-Saint-Maurice to Les Arcs, and always found them a relief that I would not have to confront another icy mountain road. Where avalanches and big delays are also an issue, as is the case with Snowbird/Alta, I would very much welcome the advent of an alternative access. I understand that a gondola or other aerial transport system is being considered for your area. Great idea from my point of view.	Peter McGuinness	Website
6362	I fully support solely an enhance bus service to reduce traffic congestion in Little Cottonwood Canyon. It would break my heart to see the road widened to accommodate a third lane for bus services or to see a gondola going up the canyon.	Colleen Koch	Website
6363	I like the "Alternative 2 - Enhanced Bus Service in Peak Period Shoulder Lanes (PPSL)". Related to this, have under/overpass solutions (with on/off ramps and/or merging lanes) been considered for the intersection of S.R. 209/210 to improve the traffic flow?	Gustav Grennmyr	Website
6364	Please support and approve the La Caille parking option with gondola access up the canyon	Pete Iacobelli	Website
6365	I support the proposal of the zero emission gondola service for access to little cottonwood canyon	David Reiner	Website
6366	To: UDOT From: Utahns for Better Transportation Re: Comments on Little Cottonwood Canyon EIS Date: July 10, 2020 Little Cottonwood Canyon Let's protect it for "all users!" Thank you for the opportunity to comment on the draft alternatives for "improving" transportation in Little Cottonwood Canyon developed by the Utah Department of Transportation (UDOT) and described in its Little Cottonwood Canyon Environmental Impact Statement, Wasatch Boulevard to Alta. We note that UDOT's alternatives include building additional lanes to better accommodate buses and bikes, including avalanche snow sheds, or constructing a gondola from the base of Little Cottonwood Canyon to its terminus at Alta. Costs for each project range from \$283 million to \$470 million. UDOT has framed the problem as a need for more infrastructure, but the real need is to change people's behavior. Not allowing cars to line up during canyon closures, implementing a toll that encourages four people per vehicle, ticketing vehicles for having ill-equipped tires, and enforcing a ban on roadside parking—could have been done years ago. The gondola option is too exclusive in that it would not serve all users of the canyon. It would make stops only at Snowbird and Alta, accommodating skiers and benefitting the privately-owned resorts. But not everyone skis and skiing is not, and should not be, the singular purpose of our canyons. The problem seems to have been framed with economic development and automobile mobility as the priority of this state-led effort. The solution needs to be more inclusive, addressing the needs of all canyon users—hikers, cyclists, runners, private cabin owners, nature lovers, and yes—skiers. It is UDOT's "purpose and need" for the project, which prioritizes economic exploitation and two ski areas over every other value and use, including water, air quality, and non-resort recreation. We strongly support the option of frequent buses—convenient, reliable and affordable— with first-class loading/unloading stations—mobility hubs. Digital readouts announcing if up-canyon parking lots are full and the time of the next bus arrival, and amenities including hot drinks, lattes and hot chocolate, could make the bus/ride share options an attractive convenient choice. This more inclusive option could significantly increase the number of people using transit because it would provide direct access to trailheads and resorts. During peak visitation times bus and full-car only on S.R. 210 from 8:00-9:30 am and 2:30-4:00 pm could be instituted to encourage transit use. Zion Canyon had to initiate shuttle-service only into the canyon to preserve the mobility to and experience of that special place. The Cottonwood Canyons will need the same protection in the coming years by reducing the use of private automobiles into the canyons year round. Buses provide flexibility to adjust season to season and provide transportation options for diverse canyon visitors. With evolving technology and social media tools, attractive bus transportation and ride-sharing could become an important way to protect and enjoy our canyons. Currently, on any given day while driving in the canyon, you can count the number of single occupant vehicles and their empty seats. This behavior is the root of the problem. Rather than spend money to damage a perfect, glacially carved canyon, let's invest in better connections to the canyons that don't involve using a car while providing better bus service in the canyons. There is an inherent risk and reality of living, visiting, and doing business in these mountains—nature happens. That risk was workable when these resorts were permitted, but now they and the state want more. When Snowbird opened, they pledged "man and nature in harmony." There is nothing harmonious about altering the very nature of these canyons with more steel, asphalt, or cabled contraptions. We urge UDOT to consider the benefits to the people and to the preservation of the canyon by choosing an attractive transit option. Roger Borgenicht and Ann Floor, Co-Chairs, Utahns for Better Transportation (UBET)	ROGER BORGENICHT	Website
6367	Protecting our canyons, our beautiful mountains, our watershed and the Utah way of life should not come at the expense of increased traffic by adding adding additional lanes for more travel. The State has been working to control and curb air pollution by adding and recommending public transportation, carpooling, etc. Allowing more autos to travel on mountain passes during peak winter and recreation seasons only adds to the problem, does not provide a solution. Parking in the canyons are also limited, so adding autos with lack of parking adds to the problem and is also not a good solution. Increasing more park and ride areas preferably removed from the mouth of the canyons, along with increasing the amount of bus routes up and down the canyon will provide less congested roadways which results in safer roads and less CO2 pollution. An additional solution would be to add a toll charge to travel the canyon during peak seasons. This would also motivate more to use public transportation, therefore decreasing the amount of road travel. Us residents that live in this area have a vested interest to make our canyons, our mountains and our neighborhood a place to live, love and recreate and adding more asphalt and autos does not help the ongoing concern.	Matthew Harlin	Website
6368	I strongly support the enhanced bus service. Gondola towers and road widening will negatively impact the natural environment of Little Cottonwood Canyon. Enhanced bus service provides the necessary traffic reduction benefits without the environmental costs.	Emile Kaldany	Website
6369	Thanks for taking comments on this. Unfortunately, I believe the EIS drastically diminished the importance of our watershed in this report. The Gondola alternative offered in this EIS, will not help our current problem given it will not allow people to park their cars and ride the transit system, but rather it needs an additional mode of public transit to get to the Gondola. That won't work. More importantly, there is confusion on the La Caille Gondola alternative, which isn't even part of the this EIS - yet I haven't seen anything from UDOT to clear the air on that. The La Caille Gondola alternative that is being pushed by others isn't part of this EIS, so commenting on that seems nonproductive. However, that option is better than what UDOT has come up with. Either way, the gondola isn't even proposed to be used in the summer - which it needs to be for a true transportation solution. Also, I've read the gondola would eliminate busses - that doesn't make sense. We need to get people out of their cars and on public transit. Honestly, my billion dollar wish is we could just have you guys increase busses for the short term, and then install a rail tucked in the north side with snowsheds that buzzes up and down LCC. And once the rail is in then the road is closed to all except emergency vehicles and essential avalanche personnel. With regards to the three listed alternatives in this EIS. I'm in favor of increasing busses and not expanding the road for another lane. Let's see if we make a parking lot near the bottom of LCC - like a big one that can hold people, and toll/close the road for anyone except avalanche and essential personnel, and run the busses all year long to see how that works. It's a low cost short term solution. However, I feel like UDOT just wants to build some grandiose thing that doesn't make sense - which is what the gondola is. It's no question, the gondola is being billed like an amusement park ride to sell more lift tickets than Colorado, etc. It's a subsidized chairlift by UDOT for the ski resorts, and not a real transportation solution given it won't be easily accessible, and isn't planned "o run in the summer. As I write this comment, there were cars lining both sides of the road near White Pine in July, and those cars went all the way to the curve below Entry 1 at Snowbird. If UDOT wants to build a gondola at all costs, it needs to be a transportation solution not a park ride to sell more lift tickets and further clog up the canyons with a carrying capacity that will overrun the place. In its current presented format that is all that it will do.	Erme Catino	Website

If UDOT wants to build a gondola at all costs, it needs to be a transportation solution not a park ride to sell more lift tickets and further clog up the canyons with a carrying capacity that will overrun the place. In its current presented format that is all that it will do.</p>	Anna Catino	Website
6371	<p>How does it cost more to do just enhanced busses without lane widening in om costs than with lane widening when it's the same amount of busses? The only option here I kind of support is enhanced busses with no lane widening.</p>	James Anderson	Website
6372	<p>The Wasatch Blvd Expansion should be revisited in 2030 to see if it is necessary. Not within WFRC's Phase One period. Building now in uncertain times and when the original LCC EIS was limited to accommodating ski traffic flow, building out Wasatch Blvd for projected population growth of 37% which will take place in the central and western portion of Salt Lake Valley is unnecessary. Southeastern quadrant of Salt Lake Valley is largely built out and commuters should be routed along existing arterials of Highland and 1300 East with enhanced Express Bus transit to accommodate any future north/south commuter growth.</p>	Ellen Birrell	Website
6373	<p>The timing to consider spending a quarter of a billion dollars on a transportation solution for Alta and Snowbird could not be worse. Those businesses are likely one bad season or one epidemic wave away from financial collapse, in which case a transportation solution could be delayed substantially.</p> <p>Before any solution can be considered, we need to ask these businesses to open their books to the public to prove that they can weather 5-10 years of bad ski business. If they can prove their long term stability during the "new normal" difficult times, and commit to a fair percentage of the project expenses, then I would be in favor of the Enhanced Bus (no widening of Hwy 210 in LCC) solution on the basis that the below conditions can also be met:</p> <ol style="list-style-type: none"> 1.This solution should not reduce the current number of parking spaces to non resort users. 2: This solution not impact any currently established roadside recreation areas or user groups such as climbers, backcountry skiers, hikers, bikers, runners, etc. 	Ambrose Curtis	Website
6374	<p>RE Wasatch Blvd Expansion: UDOT's Imbalanced-lane and Five-lane Alternatives are unacceptable because they are based on facilitating high-speed through a residential area which includes eleven residential intersecting streets. Tripling existing roadway width, going from 10' wide to 12' wide lanes and straightening of roadway are the wrong measures to take as they will create higher speeds, more air/light/noise pollution and fractionalize of the Cottonwood Heights community.</p> <p>RE attaining UDOT's stated goal of greater Active Transportation mobility: More analysis of crosswalk placement is needed for enhanced pedestrian access. A desirable roadway through residential strip includes no more than one lane in each direction with either one REVERSE LANE or two additional lanes for BUS TRANSIT/HOV ONLY. The Reverse Lane alternative had only one failing metric that could be mitigated. This metric needs further analysis. Current and foreseeable future vehicular use does not warrant an expansion based on new commuter trends driven by Covid, virtual officeing, incentives for workers to live near where they work, projected housing growth focused on the west and central valley, and a projected new business epi-center located at the south/central valley area replacing previous prison space.</p> <p>More analysis is needed regarding:</p> <ol style="list-style-type: none"> 1. Egress/ingress lane design and associated roadway width on the additional six residential streets excluded from the LCC EIS. 2. Traffic calming design and whether that will fit into existing space without removing houses within the road section that includes eleven-residential streets within the Cottonwood Heights city boundaries. 3. Effect of fracturing of approximately 8,000 resident Cottonwood Heights community with a high-speed highway. 4. Heightened vehicular-sourced oil, other toxic lubricants, tire rubber and other airborne particulate matter to the water sources of Big Willow and Little Cottonwood Canyon streams. See Salt Lake Water District regulations. 5. State funding ability to build and maintain the expanded highway with diminished revenues due to projected years of reduced incoming funds from a protracted Covid-19 pandemic. 6. Projected commuter vehicle numbers and flow based on projected developments to the southwest where prison once stood. 	Jo Clay	Website
6375	<p>Please find attached my comments to the UDOT LCC EIS, draft alternatives.</p> <p>Comment to UDOT's LCC EIS Alternatives Development & Screening Process</p> <p>Project Purpose and Screening Process 2020</p> <p>Watershed impacts "not evaluated at this time, will be part of EIS"- response to June presentation Failure to consider impacts PRIOR to determining the alternatives to be brought forward into review suggests the review will either be skewed, or inadequate. Costs can not accurately be determined absent knowing watershed impacts, neither in the construction nor the operation and management costs over the life of the project, or at least the term of the analysis period, 2050. Summer operational costs should be considered (see below). Bus service only for a portion of the winter dies not meet the needs now. Summer service, more than 1 up and 1 down, could go a long way to relieving roadside parking at trailheads and at resorts. Is it not a serious misunderstanding of the "Authority of the resource" body of science to propose work that fails to take into account the full panoply under the plain meaning of natural resources, and further, the effects thereto? Screening Level 2 is identified as "Environmental and Regulatory Impacts." It is to include criteria such as, "impacts to natural resources, [and] the Clean Water Act," inter alia. Despite this broad umbrella, "natural resource" impacts are narrowed to only 'acres of floodplain' and 'critical habitat'. Such a severe narrowing is inconsistent with evaluating based on "impacts to natural resources." All natural resources ought to be included and their survival, sustainability, and aesthetics, of those natural resources, at a minimum must be part of the evaluation, to even select alternatives to study further. Less than 10 years ago, USFS conducted a transportation feasibility study in Albion Basin, the terminus of LCC, SR-210. That study acknowledged, "Heavy visitation in Albion Basin is typical during the summer months due to its proximity (less than one-hour drive) to the Salt Lake County metropolitan region, its abundance of wildflowers and recreational opportunities and the scenic alpine setting that it offers. The current popularity of Albion Basin and projected increases in area population and tourism is contributing to increasing concern about user demand with regard to sustainable visitation levels, recreation, transportation and natural resource protection." (p. ES-1) Less than two (2) years ago, the Town of Alta commissioned a report on the recreational use and management situation in Albion Basin. Following interviews with individuals including USFS personnel, Dr. Glenn E. Haas observed and reported a visitor use problem in Albion Basin due to the lack of a NEPA-compliant comprehensive recreation use management plan for the Basin. (p. 4)</p> <p>Trailhead Parking 2020</p> <p>No winter roadside parking This fails to adequately address the problems with roadside parking at trailheads in non-winter conditions, not merely holiday weekends. It is NOT uncommon to see parking full in the WhitePine Trailhead weekends, AND during the week. Such intense interest in this trailhead causes parking to overflow onto LCC, both Eastbound and Westbound, summer through the autumn. It is not uncommon to see cars parked over the white, shoulder line and protruding into the roadway. This can occur even on blind curves making it unsafe for motorists traveling along the roadway and pedestrians and cyclists trying to navigate the area. In addition, once Snowbird is in full Summer operations and/or "Oktoberfest" is underway, should Snowbird charge for parking in its lots, folks not wanting to pay that fee, park along the roadside of LCC, and along the roadway of Alta's Bypass Road. There can be many tens of cars in these location, both sides of the roadway, further narrowing the road for cyclists, reducing flow of pedestrians off the roadway, all contributing to poor sight lines for drivers in the area, and leading to possibly injurious conditions for life, limb and property. Alternative to expand parking lots at Gate Buttfress, Bridge, Lisa Falls and White Pine trailheads, include from 15 to 144 total spaces at the four areas, and adding restroom at one which resulted in actually reducing the number of parking spaces In 1989, actor, Kevin Costner, in the movie Field of Dreams, said "If you built it, he will come." By studying as an alternative, "building" it into the analysis, the odds are increased that that alternative will be selected. By putting energy into the alternatives here, the likelihood of a successful outcome of that alternative is greater. By paying no attention to an idea and making no effort to manifest it, you decrease the odds of it materializing. If it does materialize it will almost certainly come from someone else who dedicated attention and effort over time. The more time, attention, effort, and thought you apply to an idea the more likely it is that something will come of it. We do not need to increase the odds of people coming to LCC. People are attracted to all that LCC and environs offers and have been coming, in ever-growing quantity. The visitors overwhelm the natural environment in winter and summer in 2020. The USFS recognized this in 2011 for Albion Basin, the terminus of LCC. We can not expect expanded traffic "flow" nor "mobility" to somehow magically "underwhelm" the natural environment when the opposite has been occurring for at last a decade. No amount of additional parking space, whether trailhead, roadside nor resort, will be adequate to completely capture the crowds winter OR summer. UDOT's mission, of keeping traffic moving, and allowing greater flow by even more vehicles, traffic into a one-way, closed canyon, by definition sets up the process for failure. It was essential to the process that UDOT undertook to encourage the USFS to do a capacity study for the canyon. Absent that, UDOT should have invested in an analysis to know just what number of people, no matter whether they walk, cycle, travel in car, boat, train, hovercraft, bus, or gondola, can be accommodated absent degradation to the natural resource. Failing that, all alternatives pursued have the strong likelihood of failing to protect the natural resources. Inadequate EIS scope- Summer</p> <p>Summer costs should be considered (see above). Summer bus service, more than 1 up and 1 down, could go a long way to relieving roadside parking at trailheads and at resorts. Operational costs for summer should have been considered in both construction costs and operation and maintenance. Bus service, for only a portion of the winter does not meet the needs now. It needs to be for the full winter season.</p>	Margaret Bourke	Email
6376	<p>As a property owner in Cottonwood Heights, I support the position of SaveNotPave.org. I believe people need to slow down and take a moment. There are so many great,positive reasons not to expand highway transportation access in this part of the city. Wasatch Blvd is too fast and too efficient right now, by far. To enhance it's carrying capacity and the speed of travel would downgrade the quality of life and the value of this place. Please don't!</p>	Ken Metherell	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6377	I feel that a dedicated rail line would be the best choice and would serve as the best choice into the distant future. The transportation demand will only get much worse and the aerial tram idea is total folly. You would have a limited capacity and with a dedicated rail line, you could add or delete units as the demand changes. Thank you	Ralph Gochnour	Website
6378	Each of the three Draft Transportation Alternatives for access to Federal National Forest land present a distorted focus on ski resort profits at the expense of equitable year-round public access. The scale of each archaic design option would inflict undo harm on the canyon ecosystem and communities in the Salt Lake Valley. The US Forest Service, and the State of Utah are advocating the use of taxpayer dollars to support the Little Cottonwood Canyon resorts, which cater to exclusive users who pay for full-rate, all-day passes. By allowing resort traffic to dominate the transportation system the US Forest Service and UDOT are unfairly displacing the majority public. The apparent attempt to support archaic lift pass models of Snowbird and Alta would exacerbate the inefficient bimodal (twin peak) distribution that currently stresses the canyons and valley. There appears to be no provision for less expensive, off-peak, 3-hour ski passes.	Brian Hutchinson	Website
6379	<p>ERRORS and OMISSIONS</p> <p>The EIS was clearly the product of consultants. It reflects a considerable amount data, analyses and technical studies, as one would expect. It also reflects a typical consensus of "experts," skilled in producing middle-of-the-road studies for government entities. I personally know about 50 people who could have created a superior study (if they had been asked and given access to all of the data, analyses and studies available to the consultants, and paid consultants' salaries). What did the consultants miss? And what is wrong with the EIS? The study deals in middle-of-the road averages. The downside is that every aspect of the EIS study is not only complex, every aspect has a great deal of heterogeneity and intrinsic instability that make extrapolations into the future extremely weak. The EIS does not make allowances for common outlier events. The EIS lacks input from individuals with years of cumulative experience and expertise driving in LCC. Who are these people? People who drive up and down LCC on a daily basis: skiers, resort employees, bus drivers, bus riders, commercial drivers - all could have provided input into the daily range of conditions that arise in LCC daily. These people, as a group, have a large amount of observational experience that the consultants do not appear to have accessed. The EIS should have been exposed and critiqued by these people BEFORE the EIS was posted for public comment. The EIS is not ready for prime time. It needs another round of editing by LCC experts. I noticed significant errors and omissions. There are errors that should have been picked up during proof-reading. I also think some of the data is highly suspect. The input data needs to be verified (by an independent source). Otherwise it is GIGO.</p> <p>Planning for 2050 would be nice. Implementing a 2030 plan in 2000 would have been better. It was never done.</p> <p>My particular expertise is with the bus system. The UTA ski bus is functional but not well run. It can be characterized as being nearly brain-dead, run on auto-pilot, with little flexibility and almost no situational awareness. While there are UTA employees who are extremely well informed about the Ski bus operations, I detect a lot of fear among employees. It is better to keep your head down and just do your job; there appears to be little incentive to make suggestions or achieve a higher level of operational excellence. I have studied ski bus operations at a level that few riders have. The Ski Bus has worked well for me because I understand where the weaknesses are. And there are many. Do I tell people? Absolutely not. People with my level of knowledge aren't talking because the Ski Bus is barely functional. Given the current situation and the slim prospects for genuine future improvements, if someone wants the Ski Bus to work for them, they have to do the analysis for themselves.</p> <p>CURRENT SITUATION ANALYSIS The current management of LCC transportation is spread across several entities (UDOT, SL County Police, etc.) and therefore inconsistent and haphazard. Is the management optimized in any way? It doesn't appear to be. The fact is that the population structure of LCC drivers is complex and consists of several different clientele, some of which are extremely diverse. Traffic Enforcement: In my experience, regulation and enforcement of up and down traffic is usually ineffective and easy to game or evade. This situation encourages scofflaws and creates traffic flow problems when the predictable accidents occur. An example. Occasionally the sky is clear at 8:00 am on a winter morning; Hwy 210 is clean and dry. However, a large storm is forecast to move in and dump 2 ft of snow between noon and 4 pm. Everyone knows this at 8:00 AM. Yet, the yellow blinking lights at the LCC entrance are not activated. There is no inspection or enforcement of the chains/4WD regulation. People in 2WD drive vehicles proceed up-canyon. Why does this happen? I understand the blinking lights can't (legally) be turned on until there is snow on the road. Also, the SL County police department lacks manpower and the funding to inspect 24/7. This situation allows cars and trucks that lack 4-wheel drive into the canyon when the road is clean and dry. These are the cars and trucks that predictably run into trouble when they later attempt to descend LCC when road conditions are poor. They are hazardous to themselves and every other vehicle on Hwy 210. This needs to be fixed.</p> <p>CURRENT SITUATION TO DO LIST TOP OF LIST: INSTITUTE AN IMMEDIATE CANYON USE TARIFF ON ALL SKI TRAFFIC INTO LCC. THIS NEEDS TO BE DONE BEFORE ALTA & SNOWBIRD START CHARGING FOR PARKING. ALTA & SNOWBIRD SHOULD NOT BE ALLOWED TO BEAT UDOT ET AL TO THE PUNCH. A CANYON USE TARIFF IS THE ONLY WAY THAT WINTER TRAFFIC CAN BE REDUCED BY 75%.</p> <p>Rather than list the deficiencies of the current traffic management problem, I propose using RFID technology and new rules, regulations, enforcement that should have been in place as of November 1, 2020. Option 1: Legal Definition: Legally redefine LCC as an exceptionally dangerous place to be drive ordinary cars and trucks during the winter. Restrict canyon entry to approved vehicles meeting a minimum standard of public safety. Approved Roadworthy Vehicles: 4WD with approved tires that pass inspection as of Nov 1. Use ""Snowflake tires""? Approved vehicles have RFID ID sticker installed for a fee. Only Approved Vehicles allowed entry into LCC: LCC canyon entry restricted to inspected vehicles. Use RFID technology to screen cars. Cars without RFID could perhaps be inspected on the spot, for a fee. Seek Police input on this. The RFID ID sticker can also be used to collect the LCC USE TARIFF proposed above. Option 2: Continue current unsatisfactory traffic management practices with the following additions: Require that all consumer vehicles have 4WD with approved tires that pass inspection as of Nov 1. Use ""Snowflake tires""? ""Roadworthy as in Option 1 above"". Do daily inspection of all cars in LCC, including Alta & Snowbird lots. Issue citations to non-conforming vehicles. This should be being done now. I have reason to believe that Alta & Snowbird would both allow inspection and citation on their property if they were asked.</p> <p>Looking at the EIS, I am reminded of Occam's Razor: Don't create elaborate, expensive theories and models when simple ones will do. A major problem with current traffic management is that the many entities who affect skier traffic have failed to cooperate to work out management improvements. This is an ongoing problem. I am not talking about a ""mountain accord"" resolution. I am talking about practical, near-term, operational partial-solution improvements, as described above. Do the simple things now, before undertaking poorly thought out solutions proposed by parties with other, unknown motives. In addition to planning for the future, why haven't the various entities done the simple things?</p> <p>NO CONFIDENCE VOTE in EIS report. The EIS describes the current status of the traffic management problem as a starting point to finding a 2050 solution. There are serious problems with this statement. 1. The starting assumptions are flawed. In particular, I have a problem with the current traffic statistics. I have seen similar statistics published in Salt Lake City Tribune (2019). But the numbers are very different. I recall seeing that about 33% of the LCC traffic originated in Park City. I recall seeing that about 33% of the vehicles were rental cars. I remember seeing another 33%. but I do not recall what was measured. An interview with a Ski Resort CEO in 2020 revealed that he knew about the SL Tribune data and believed it. These SL Tribune numbers vary greatly from those provided in the EIS. Which numbers should I believe? Why should I believe the EIS data? I think the EIS data may be selected data, not indicative of reality. 2. Climate Change considerations. I have seen this before. The EIS glosses over the 2050 Climate Change predictions. I recall reading a 2000 prediction for 2030 and 2050 when I moved to SLC in 2002. Its predictions seem to be on schedule as of 2020. If the skiing is going to be poor to non-existent in 2050, does SLC really need to spend a billion dollars to prepare LCC for 2030? This is not to say that LCC (and BCC) don't need a better traffic management plan. The Cottonwood Canyons need a good traffic management plan irrespective of snow quality in 2050.</p> <p>WHAT DO I THINK OF THE EIS PROPOSALS? Not much. There is not a lot of substance to the proposals and a lot of uncertainty. This is what happens when the preliminary analysis is not well executed. 1. Minimalist bus proposal. Not very different from status quo. Tripling bus capacity is not a solution. In order for this proposal to succeed there would have to be a 75% decrease in LCC vehicle traffic, which is not going to happen. The centralized hub proposal is poorly thought out. See the RFID-based LCC Tariff Proposal. 2. Enhanced bus proposal, including a dedicated bus lane. Again, without a 75% decrease in LCC vehicle traffic, the success of this proposal is uncertain. The centralized hub proposal is poorly thought out. See the RFID-based LCC Tariff Proposal. 3. Gondola proposal. This proposal is not new. It sounds great, until there is a discussion of how to fund the construction and operation. This proposal is great for Alta and Snowbird. They expect public funding. If a Gondola is to be built, then the ski resort operators and other LCC businesses should work out a way to fund it.</p> <p>WHAT WOULD WORK - near term There should be an immediate and significant Canyon Transit fee collected at the LCC entrance. This fee should be applied to subsidizing the Ski Bus and implementing the RFID system I suggested above.</p> <p>SUMMARY A traffic management plan for LCC needs to be a well thought out, integrated plan. This EIS is overly simplistic and rather limited in outlook. It fails.</p>	Bruce Duncan	Website
6380	We strongly oppose to widen Wasatch Blvd and bring more cars. As the residents living in this area, we pay the tax and deserve to have healthy life and live in clean environments. There is no reason to use our tax money to benefit the skiers with bringing more noises and pollution to the residents here. Also the city/sate should either mail or E-mail every family living here to let everyone be aware of this project and hear our voices. Many people here do not know about this. Please stop destroy canyons to meet a few days of heavy ski traffic.	Bo Hong	Website
6381	I oppose the gondola idea. Too limited parking and too much damage to pristine canyon with limited capacity to get lots of people up and down the canyon. I prefer the 3 lane theory with up lane for bus in morning and down in pm and with avalanche tunnels where needed.	Jan Sharp	Website
6382	As a resident of the Green Hills area of Cottonwood Heights, I strongly support putting money into the gondola + bus solution and minimizing expenditure on new roads. There are many winter days when I would prefer to take public transport up the canyon to Alta but the parking lot at the base of the canyon is full and there is no bus I can walk to.	Derek Brown	Website
6383	Why are we reducing the number of parking spaces for hikers and campers. I have used the Little Cottonwood Canyon for over 60 years and find it ridiculous that there is never enough parking spaces for us hikers in the Spring, Summer and Fall.	Gary Russell	Website
6384	I support the gondola, we do not need more emissions in the canyon.	Rose Francis	Website
6385	I have been an avid rock climber for over 40 years and Little Cottonwood Canyon does not have enough parking for rock climbers and most of the parking is in the wrong areas. I have climbed with people that have traveled from Europe to climb our mountains yet you make them park illegally in order for them to climb. This is not right. Why does UDOT discriminate against those that want to rock climb on some of the most amazing cliffs in Utah that are up Little Cottonwood Canyon.	Gary Russell	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6386	<p>General Comment 1. Cost Estimates. The cost estimates are listed as a single value, with a contingency. This may be appropriate at this stage of the process. In selecting an alternative, it is going to be important to provide an uncertainty analysis. We are all familiar with projects where the actual cost far exceeded what was projected.</p> <p>It may be that two alternatives have similar best estimates, but one of those has far greater uncertainty. The cost estimates in the EIS should give provide insight into how good each of those estimates is.</p> <p>For example, in Appendix E, footnote 11, it is stated that the costs for components of the ATS were based on those from a facility at Whistler Blackcomb. Estimating the cost of a project from a single data point without knowing whether the Whistler Blackcomb project cost is typical, or substantially higher or lower than typical, introduces huge unknowns into the cost estimate. And this is without knowing how materials costs may have changed from varying prices of commodities or tariffs, and whether the challenges associated with the two projects are comparable. As should be obvious, this is not the only instance in the report where a cost estimate was based on the costs of only one other project.</p> <p>General Comment 2. The report should explicitly evaluate the impact of the mobility hubs on Wasatch Boulevard traffic. What will be the impact on traffic at large when large numbers of skiers are trying to access them on normal days? During a major snowstorm? If there is an accident by the entrance of a mobility hub? If this contingency was included in the analysis, it was not obvious from reading the report.</p> <p>General Comment 3. The report should evaluate the robustness of the alternatives should traffic demand be substantially greater than what was assumed in this report. The report used point estimates for estimating the growth of traffic demand (Section 2.1.2.2.3). If the growth rate is larger than anticipated, how well could each alternative be adapted to accommodate that growth?</p> <p>General Comment 4. Unacceptable visual impacts have been noted in this report when screening some alternatives. In the discussion of Reversible-Lane Alternative with Overhead Lane-control Signs in Section 2.2.2.1.3., it is noted that the visual impact of overhead signs for reversible lanes was unacceptable. Section 3.1.2.1.1 addressing snow-supporting structures, notes the substantial visual impact that these would have in screening out this alternative. However, the visual impact of gondolas, especially on backcountry users, was not addressed. The visual impact of the gondola on hikers, skiers, and others is far greater than that of the signage or the snow-supporting structures. It needs to be considered. Visual impact cannot be a criterion for some alternatives and not others.</p> <p>Section 2.2.2.1.2. This section notes the problems associated with vehicle slide offs and the potential to back up traffic. While this discussion is made in association with a roundabout, it is also a concern with the alternatives that made it through the screening process. In particular, if there is a vehicle slide off or other accident in Little Cottonwood Canyon that would affect access to the Gondola loading station, that could result in a horrific traffic mess. The report should analyze the potential impact of traffic accidents on surrounding traffic.</p> <p>Section 2.2.2.2.1. In the evaluation of the bus only alternative, it is stated to be impractical because bus loading/unloading times are longer than the frequency of bus departures that would be required. However, that assumes that buses are loaded in series; i.e., it assumes that there is a bus at the front of the line that will depart next, and it is loaded before the next bus is loaded. One can imagine buses being loaded in parallel – for instance, having six separate sections of a parking lot where buses would be stationed. This would allow for multiple buses to be loaded at once. And since this alternative would eliminate much of the parking required at the ski resorts, those parking lots could be reconfigured to allow for six drop-off areas.</p> <p>This comment does not address the feasibility of establishing sufficient parking at the mobility hubs to accommodate this level of bus service. The report does not provide sufficiently detailed analysis to determine whether that concern in isolation would screen out this alternative.</p> <p>Section 3.2. The report should also evaluate having a shuttle between Snowbird and the White Pine trailhead (and perhaps other destinations). That could substantially reduce the demand for parking by backcountry users.</p>	Steve Glaser	Website
6387	<p>The fundamental flaw of this endeavor is that it does not truly address the environmental impact of the proposed actions. The true impact is not to the road or the elements of the transport system; it is the impact on the environment by the humans who are brought into this canyon. Claiming that those issues are outside the scope or jurisdiction of UDOT is willful blindness.</p> <p>Little Cottonwood Canyon is overused now, its capacity to absorb more human presence without severely damaging the natural environment is behind us; we're past that. It makes no sense to try to bring more people in or to bring them in faster or more efficiently. There are too many of us using this finite resource today and that will be more stressful as the population of the region increases as it clearly on track to do. If this agency were truly sensitive to protecting the environment it would be looking for ways to reduce the number of people here, not increase it. Making it easier to get into the canyon is the antithesis of protecting the environment.</p> <p>I recognize that UDOT is a transportation agency hence its purview is limited to moving people and goods. But I ask you to think more broadly and ask yourself, "what are we doing here? what conditions are we creating? Are our anticipated actions making the world better or worse?" My sense is that UDOT is doing the latter—making the world worse.</p> <p>As to the alternatives on the table, the gondola should be rejected out of hand. It's shortcomings are at least these:</p> <ul style="list-style-type: none"> •It only serves about 10% of the peak demand. •It requires 2 mode transfers to ride it, first to a bus then to the gondola car •It presents another significant scar on the natural environment; towers and cables and circulating cars are unwelcome. It is better suited for an amusement park than a place of nature. •It serves only the two ski resorts and does nothing to relieve congestion in the mid and lower canyon •It is not all weather—wind or lightning shuts down these machines •It presents challenging rescue issues if the machine stops running •It crosses the Wasatch Fault and is susceptible to stranding passengers after an earthquake. <p>Similarly the snowsheds should be rejected out of hand. The canyon road is closed by avalanches less than 10 days/year now. The snowsheds might halve that number. The public investment in billion dollar snowsheds so that 2 private resorts can get more customers on approximately 5 days a season, is completely unwarranted. It represents a huge subsidy by tax payers to resort investors. SR210 is not a major transcontinental highway which needs to be open continuously for smooth functioning of the country. It is a one way road serving 2 ski resorts, many recreationalists and a handful of residents. The fate of the world, or even the Utah economy, doesn't rest on the uninterrupted use of this canyon road.</p> <p>Why do people prefer their cars to go skiing? It is simply convenience. The most convenient mode is to load up the kids and gear at home, then drive as close as possible to the ski lift and unload, at a time of your own choosing and using one's car as a locker for equipment, refreshments, etc. To compete with the car, a transit system needs to be nearly as convenient. In particular it needs to have a minimum of transfers. An arrangement where one drives to a park-and-ride, unloads the car and shleps the kids and equipment onto the bus, then is transported to the resort, possibly without a seat, doesn't make it. On the other hand, a dispersed bus pickup arrangement where one walks a short distance to catch the bus, might compete with a car.</p> <p>There seems to be little recognition that expanding the roadway will only increase traffic. The mantra from the movie Field of Dreams is applicable here: "If we build it he will come." History shows that demand rapidly expands to fill road capacity. If one is in the business of continuously building roads, then that might appear to be favorable, but it certainly doesn't serve the interests of preserving the remaining remnants of our beautiful mountains.</p>	Roger Bourke	Website
6388	<p>I am disappointed in the process that is being implemented. I have attended numerous meetings over the past several years. The public has given very strong support for reducing the speed along Wasatch Blvd. The public identified many problems with the design of the high T intersection. Utah DOT went ahead and built the high T intersection and then needed to make modifications because of problems identified by the public. I believe that local residents understand issues that Utah DOT seem to gloss over. The speed of Wasatch Blv needs to be reduced. A highway expansion that leads to a two lane canyon road going up Little Cottonwood Canyon does not make sense. It is a highway to nowhere! If the highway is to provide a transportation route for residents who live in Sandy and south of Sandy, then it is irresponsible to use state funding designated to provide access for recreational purposes.</p>	Jo Clay	Website
6389	<p>I am frustrated on spending my time reviewing proposals, sending comments, and not seeing any of my concerns addressed in the new proposals or hearing nothing in return. Last year promises were made but follow through seem scant.</p>	LeeAnn Ehrhart	Website
6390	<p>Of the three options being considered, I support the gondola over expanded bus service. Bus service is not creative and is still prone to the problems of today... too many vehicles on a road, slide-offs in snow and avalanche delays. I think the most creative idea to truly address traffic in 30 years is the Boring Company. Otherwise, I think the 2 main mobility hubs are well placed and the improvement to Wasatch Blvd and improving trailheads are well thought out.</p>	John Eckert	Website
6391	<p>It's time to turn Cottonwood Heights into a peaceful residential community. No to expanded Wasatch Blvd. and higher speed limits!</p> <p>Of the three options I vote for widening the road with enhanced bus service and snow sheds.</p>	Joanne Constantine	Website
6392	<p>I support the enhanced lane scenario of those presented. The gondola option is not practical; slow and adds more infrastructure to the canyon (since the road will still be used). This EIS only addresses ski resort traffic. There is considerable traffic generated by dispersed recreation in the canyon and this should be addressed as well. Buses need to stop at trailheads as well.</p> <p>To get people out of their cars, the cost of driving up the canyon has to be more than the transit option. I would support a toll for all cars driving up the canyon that would be at least as expensive as the mass transit cost.</p> <p>I didn't see any discussion on planned hours of operation. This should be addressed (unless I missed it). Bus service would have to extend into the late night hours so customers at the resort's restaurants could get home</p>	Arthur Hanson	Website
6393	<p>I'm a part of the climbing community and would really appreciate that the changes do not remove or affect climbing access/available crags. I would prefer the bus only addition without expansion. Thank you!</p>	Joanne Young	Website
6394	<p>gondola is a good idea. canyon is too narrow for more road</p>	Ronald Collins	Website
6395	<p>No gondola. All that money for a few powder days and weekends? It would ruin the canyon. More/better bus options that should be mandatory on weekends or toll the roadway. I feel bad for those backcountry skiers or snowshoers though. We need a better parking situation at the mouth of the canyon with better and more frequent buses. And the resorts need to step up their game with realistic on site storage and lockers. Bringing a family up the bus, with extra gear and good is unrealistic. That needs to be addressed. No gondola!</p>	Ryan Sehloff	Website
6396	<p>Joshua Vanjuren spoke with us concerning the Little Cottonwood Canyon project. I have been a City Administrator and just finished managing a factory for Morgan Advanced Materials in Indiana and I have been never treated so poorly by a State Employee as Joshua was to us. He was rude and condescending with what appeared to be total contempt for us. I am surprised that Utah employs such employees. My past experience as a City Administrator with UDOT has been extremely positive and we completed several projects in the spirit of cooperation. It is obvious that Joshua has a contempt for us hikers and rock climbers, and local citizens that live at the mouth of Little Cottonwood Canyon. I will do my best as a former City Administrator and professional to bring to light what kind of people are now working for UDOT. I've worked on projects from India to Chicago and have never dealt with such arrogance from a public servant. I also know that someone with that type of attitude is being supported and protected by those over him otherwise he would have not been so cocky, arrogant and rude to us. I will make sure that the truth is presented to the good people that I know in power here in Utah so that it can be properly dealt with. Joshua owes everyone that attended his presentation an apology. Just because someone disagrees with you doesn't mean that you have to be rude and condescending to your audience. Last I knew we were a Republic where individuals had a say over what happened in their neighborhood. Obviously UDOT no longer believes that and does not honor or even desire positive input from the citizens whose homes are affected by their decisions.</p>	Gary Russell	Website
6397	<p>I took my first class in Rock Climbing over 30 years ago and we climbed in Little Cottonwood Canyon. Now it sounds like if we climb in Little Cottonwood Canyon after this project is done we will be ticketed or towed. What do you have against Rock Climbers. Your going to spend half a billion dollars on roads for skiers yet a few thousand dollars to add some parking for Rock Climbers is not an option. Not Cool.</p>	Gary Cox	Website
6398	<p>At this time, the enhanced bus service WITHOUT widening the lanes is the most appealing option to me. It requires fewer transfers than the gondola and takes less overall time. I am concerned with the aesthetics of the snowsheds and am in favor of making them as architecturally appealing as possible and would hope that due diligence is done to achieve this — multiple proposals, renderings, bids, public comment. Thank you.</p> <p>Protecting the watershed and minimizing impact to canyons should be the priority. Why continue to erode a very finite resource for a few days a year so people can recreate faster.</p>	Danielle White	Website
6399	<p>Ryan McDermott</p>	Ryan McDermott	Website
6400	<p>I favor option 1 as it will improve traffic to private resorts without making it more difficult for folks to recreate in other ways at different times of the year - back country skiing, climbing, etc.</p>	Emily Spoth	Website
6401	<p>Gondola is not the answer. Limit personal cars, add public buses. Use existing roads. Create a space in the valley for ample parking and usage for all UTA transportation. A gondola will only serve the resorts. The gondola will not solve the summer traffic problem, it will only Become be an 'attraction' for the resorts, potentially increasing the congestion problem in the valley of Salt Lake. Summer traffic is constant up the canyon, we need a solution that will address both summer and winter adequately. Provide easy access to all parts of the canyon (not just the resort) and something that is environmental friendly. Something that will not disturb the current state of the canyon and won't disturb current residents and animals/plant life. An efficient Public bus system with limited personal cars is the option. Provide parking at mouth of canyon - possible areas include gravel pit at base of BCC, and the UTA lot by Walgreens on 9400. Consider turning the old Shop-co lot on 9400 into parking. There are other sufficient options. Gondola is not the answer.</p>	Karin Peterson	Website
6402	<p>I would prefer for the road size not too increase, so it wouldn't impact the rock climbing in the area</p>	Timothy Worley	Website
6403	<p>You are going to spend a half a billion dollars to make it so that skiers can get to the slopes faster, but you do not seem to care about the rest of the Salt Lake Valley. Have you been up Butterfield canyon recently. It is packed with traffic, but the road is still dirt at the top. When are you going to spend a few million dollars and finish that road. If you actually develop that area for recreation it will relieve some of the stress on Little Cottonwood Canyon across the valley. Giving your good tax paying citizens some options will help some of your problems. Also if Butterfield Canyon was paved between Salt Lake and Tooele you would have some happy commuters that would use it as a short cut to work and you now have another exit out of the valley in case of an emergency such as an earthquake. UDOT please consider the citizens that pay the taxes that pay your wages and stop spending billions of dollars in order to take care of a few wealthy ski resorts.</p>	Gary Cox	Website

6404	I have visited Little Cottonwood Canyon many times in the past and noticed the amazing wildlife and scenery it has to offer. This view makes staring at my phone almost impossible, and I hope that it is preserved for our sake as well as the surrounding environment. Based on these hopes, I see options like an enlarged bus service to be the best alternative. Although the gondola could be seen as a better alternative because of its minimal Operation and Maintenance costs, it would be damaging to the surrounding canyon environment (land would need to be cleared and stations constructed) and has the longest proposed travel time of all three proposals. Widening the road seems like a good option because it is by far the shortest proposed travel time of the three, and would add roadway capacity. However, this option would also damage the environment due to clearing land, building supports, etc. Since widening the road offers so many benefits, perhaps it could be done in a more minimal way to the environment that still adds to the existing roadway. I'm not the most researched person and the impacts of each alternative could be more or less extreme than it seems, but I hope that measures are taken to consider the environmental impacts of each option and to follow through on making the impact as little as possible while still improving the existing systems. Thanks for reading my comment!	Nora Ransom	Website
6405	I support the Enhanced Bus Service without roadway widening, with snow sheds to reduce powder-day road closure congestion and private vehicle tolling (at least in upper canyon) to encourage bus ridership. I am trying to keep an open mind about the gondola, since I have been to europe and I do ski the resorts... but if you have to take a bus to get to the gondola, that stinks. You should just stay on the bus at that point! I see that the La Callie Base promoted by the ski resorts could include parking at the base of LCC, but it seems like there is limited real estate for the parking garage there? Also a big garage at the base of LCC would be unsightly, and it would still push a lot of single occupancy cars through the cottonwood heights neighborhoods. I also think having a gondola AND a road in the bottom of LCC would be a big (visual) impact to the natural character of the canyon. Boulderding while a gondola cruises overhead? Ski resorts are so ugly in the summer already. Hiking, biking and climbing recreation at the base of the canyon with the gondola running through everything is not appealing. To speed up travel time I see that peak-season winter busses would not stop at trailheads, but I could see them being flexible in the summer by providing trailhead access whereas the gondola would ONLY go to the resorts, ever. Granted BCC has a lot more trailheads than LCC (which mainly has White Pine and Lisa Falls) so it's not as big of a deal, but the gondola would just be an extension of the resort and would not be able to alleviate summer congestion and parking in the rest of the canyon. Another point: the bus (or gondola) needs to be free to ride to work, otherwise people will just want to drive. Not because of the cost, but because figuring out how to pay is a hassle. You already have gas in your car so that's easy, but how do you pay to ride the bus? Do you need to fish out your credit card from your ski clothes while everyone waits behind you to get on the bus? Do you need exact change (the worst)? It's stressful. The transit needs to be free and the road needs to be tolled to get people on the transit. I am generally opposed to having 2 Peak Period Shoulder lanes, since that is a significant widening of the road and would impact the canyon (and the bouldering!), but I could see adding a single, directional peak use bus shoulder lane, maybe, since there is already a wide shoulder in some places. This would just keep the buses moving in the bus direction at peak-peak times (Saturday powder morning). But not 2 lanes - making it a 4 lane road - that seems unnecessary. And I would hope that with the snow sheds the 8am avalanche control road closures would be reduced, which is a big source of the winter congestion that backs up on Wasatch Boulevard. Lastly, all of the plans appear to re-configured Wasatch Boulevard through Cottonwood Heights to handle traffic growth, and I'm concerned about neighborhood impact of faster, wider road there. How do resident pedestrians cross the road? Thanks, Evan Johnson	Evan Johnson	Email
6406	While I acknowledge the gondola's cost effectiveness, I believe it does not provide access to the middle and lower portions of little cottonwood canyon, and creates a permanent eyesore in an otherwise beautiful area. Widening the road is my preferred option, as increased bus service will be able to accommodate all users and all trailheads, and the wider road would likely be able to better accommodate a future train that links seamlessly with the UTA TRAX system that already exists. Since the road already exists, widening it does not really take away from the natural splendor of the canyon.	Matthew Fix	Website
6407	I prefer the Gondola solution as I think that has the highest probability of reducing traffic congesting and the lowest environmental impact	Craig Heimark	Website
6408	I am a frequent visitor of Little Cottonwood Canyon and I support the Gondola alternative with dedicated parking at the proposed La Caille base station. We must reduce the use of vehicles in the canyon for day visits and this is the best way to do so.	Hans Hyttinen	Website
6409	I support the Gondola with the proposed La Caille alternative. If that is proved infeasible I still support the gondola alternative. My decision is based on environmental impacts, feasibility, and parking availability. It is vital that any plan is paired with a toll or parking charge to use the canyon. Gondolas are significantly better for the environment, not to mention easier to install than any road expansion alternative.	Zev Rosenfield	Website
6410	There are several good ideas yet you won't combine them and do what is best for your tax paying citizens. Where is the extra parking at the bottom of the canyon that is needed. If traffic is going to grow by 46% why are you reducing parking for hikers. Where is the parking for those that rock climb. Where is the parking for those that want to watch the mountain goats and wildlife. Why are we spending half a billion dollars so that a few skiers can get to the slopes faster during a few days of the year. So you spend 500 million tax payer dollars so that skiers can get to the slopes faster on about 10 to 30 days a year. So we spend an average of 33 million dollars a day in order for some skier to get to the resort 20 minutes faster. What a waste of money. You definitely need some people that have some better ideas. Last I knew the canyon has visitors 365 days a year yet you are worried about 20 or 30 ski days a year and taking care of some wealthy ski resorts. What about the other 335 days a year. Where is the parking for hikers? Where is the parking for rock climbers? Where is the parking for the campers? Where is the parking for the wildlife observers? And most importantly where is the handicapped parking for all of my friends that can't ever experience the beauty of the canyon because they are handicapped. I can assure you from 50 years of experience that there is not enough handicapped access for my son or wife who are both handicapped and the ski resorts have done nothing but discriminate against them when it comes to my experience so why does my tax money pay for rich skiers while excluding those that are handicapped or just plain poor. Yet those citizens pay taxes just like the rest of us.	Gary Cox	Website
6411	Where is the balance when it comes to Little Cottonwood Canyon. What about those that enjoy the canyon in the Summer. Don't tear up the canyon so that skiers can get their faster while those that enjoy the beauty get nothing, but parking tickets or worse towed.	Gary Cox	Website
6412	My long time friend Jacob Nolan sent an important message to you earlier in regards to a project that would destroy a large part of his life and passion for rock climbing in Utah. He's among many others are so proud, please dont take away such a glorious privilege. Thank you.	Tyler Holmes	Website
6413	A gondola is a very expensive option that will only transport a fraction of the people / skiers that go up the canyon. Is this really a good use of public money? It still does not address the parking issue any differently than increased buses does.	Julie Easton Gregersen	Website
6414	We need more buses without an additional lane (and not an extra lane or gondola) that will damage the watershed, natural habitat and climbing in Little Cottonwood and be irreversible.	Rachel Howard	Website
6415	I am a skier AND cyclist, mountain biker, hiker, mountain climber and rock climber. As such, I love Little Cottonwood. However, I can't imagine spending tens, to hundreds, of millions of dollars on something (a gondola) that would only benefit ONE group for FOUR months of the year. This is ridiculous. Especially when we consider the fact that these are taxpayer dollars going to benefit PRIVATE resorts (who already make a profit). I understand that there are benefits to the Utah economy, but I also know that I would have absolutely no problem accessing those sites by bus. I already do that at other ski hills around the world, why should Alta/Snowbird be any different? The costs AND environmental impact of a massive gondola project (I'm in construction, I know) are far too great to be justifiable before all other options are exhausted. Even then, more people on already crowded slopes and lifts will not likely be the draw you think it they will be! I hope reason wins out in this case. Thank you for your time.	Kevin Wilson	Website
6416	Please consider option 1 - increasing bus routes without widening the road. If there could eventually be a Gondola that is much, much smaller than the snowbird tram and lower impact that would be helpful. But right now, I'd like to see more buses without widening the road.	MEAGAN GALLAGHER	Website
6417	The ski resorts have been so insensitive and cold to those who are handicapped over the last 30 years so why do you add insult to injury and continue their abuse by supporting their anti special needs agenda that insults and keeps away those who are not wealthy and normal in their eyes. Catering to those that can ski while the handicapped that can't ski are not invited to the beautiful Little Cottonwood Canyon since their is no spot for them. Because parking and trails and roads are designed to exclude those with special needs from ever seeing the beauty that is there unless they want to be towed and ticketed.	Gary Russell	Website
6418	The ski resorts have been so insensitive and cold to those who are handicapped over the last 30 years so why do you add insult to injury and continue their abuse by supporting their anti special needs agenda that insults and keeps away those who are not wealthy and normal in their eyes. Catering to those that can ski while the handicapped that can't ski are not invited to the beautiful Little Cottonwood Canyon since their is no spot for them. Because parking and trails and roads are designed to exclude those with special needs from ever seeing the beauty that is there unless they want to be towed and ticketed.	Gary Russell	Website
6419	Creative options such as the gondola NEED to be explored	Nicole Lopez	Website
6420	Wasatch Boulevard is one of the best areas for cycling. I would ask that if changes are made in order to increase motorized traffic, that the building plan include an extension of the bike path that currently ends at the crossing of Parley's Canyon. Separate bike paths offer greater safety than bike lanes contiguous with existing roadways.	Michael Battistone	Website
6421	As a boy I camped at the mouth of Little Cottonwood Canyon. Learned the history and skied at Alta. Then I married a wonderful woman with a handicap and learned that Alta and the ski resorts are only interested in people with money and that can ski. My wife was discriminated against along with our son with special needs. Why do my tax dollars pay for something that excludes those with special needs. And your actions are going to only reinforce that. Traffic is going to increase by 46% but options for those with special needs for parking etc. are going to be greatly reduced. Get your priorities right please. The next generation is going to pay for your mistakes and extreme prejudice.	Gary Cox	Website
6422	As a cyclist and skier, I HIGHLY support the idea for roadway widening with an increased bus route. I cannot stress enough how having a wide shoulder would be incredible for the cycling community. Little cottonwood is a hugely popular cycling route from April - November and giving it a dedicated cycling/pedestrian lane would make it into the best climb in the state. Additionally, I have had many close calls with cars going up LCC, so having more space between cyclists and cars would benefit everyone! I also think that a tram would ruin the beautiful landscape of the canyon and make residents angry. Thanks so much!	Niels Wheelwright	Website
6423	Please do not make Conwood Heights a parking lot. We continue to lose natural beauty in the quest for more development. Thank you.	Emily Weigel	Website
6424	We need more buses without an extra lane or a gondola. This will damage the watershed, natural habitat of many animals, and climbing in the canyon, and all of this won't be reversible.	Sammy Sanyal	Website
6425	There is no question that the enhanced bus system should be the only option being considered. While the gondola seemed like a good idea, I don't believe it would actually solve the problem at hand: transportation. Roads will still be just as jammed due to people preferring to drive. The only benefit would be during times of avalanches/road closures. The enhanced bus system without road widening would keep the canyons how they are now, still somewhat "wild". The canyons are becoming more and more crowded and have less and less natural feeling to them. Road widening or a gondola would just push little cottonwood more in the direction of a simple tourist attraction. Not a place to escape the commotion and to connect with nature.	Brennon	Email
6426	Please, I urge you to consider the environmental impacts of the current options on the table. The ski resorts should not get more of a say in how our beautiful canyons are used and developed. Please protect the watershed, the air shed, and the beauty of our canyons!! We need smarter public transit to the BASE of the canyon rather than additional infrastructure and building IN the canyon. Our family has a cabin in Big Cottonwood Canyon that is 70 years old. Our connection to this land is personal and spans generations. I urge you to consider more than the economic benefit to a few stakeholders (ski resorts).	Barbara Thornton	Website
6427	Please consider adding an alternative transportation method to get to the ski resorts and recreation in little cottonwood canyon, parking structure, buses and gondola are all great options	Sally Tauber	Website
6428	As a resident of the Town of Alta, I support the LaCaille gondola proposal. The idea of using buses to shuttle riders from the mouth of Big Cottonwood to then load a LCC gondola seems to be a contrived solution. Please consider studying the LaCaille alternative.	Jonathan Morgan	Website
6429	Gondola seems like the best option!	Kassia Lawrence	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6430	I strongly encourage serious planning and consideration from non ski resort recreation in the final alternatives. Some factors that need to be addressed: <p>Transportation options outside of normal times, such as early morning 'dawn patrols' or 'alpine stars' and night time 'apres ski.' The primary reason I never took the ski bus was because it did not run early enough or late enough.</p> <p>Access to formal and informal trailheads such as Gateway Butress, Tanners Gulch, Great White Icicle, Lisa Falls, White Pine, and Mount Superior, and Grizzly Gulch, to allow access to non resort recreation.</p> <p>Options for safe and protected bike lanes need to be considered, to maximize human powered transport options.</p> <p>Why don't you build and Alta pad for these rather than any tax dollars? I think all options are too focused on skiers and the ski season. Option 2 is garbage.</p> <p>I don't think any of these proposals really work, none of them are sympathetic to the environment of little Cottonwood canyon and will destroy the very thing people come to enjoy. Certainly not more road for cars & the gondola would be an eye sore and will not get people up the mountain at a reasonable rate. What about looking to Europe and how they cope - trains, tunnels?</p> <p>I missed some information when commenting earlier today. After reading more on this, I agree with the Salt Lake Climbers Alliance and would like to see one of the alternative options they've come up with.</p> <p>I vote (even though I know that's not how it works) for "enhanced bus with roadway widening." The mobility hub at the gravel pit NEEDS to happen. Snow sheds are essential to any plan (they work great literally everywhere else in the world). Additionally, this is the best option because it would allow access to trailheads for backcountry users and summertime use.</p> <p>However, I do urge you to come up with an interim solution. We should not wait until the end of the final EIS to start improving the bus system.</p> <p>It's a super big deal because of more season - but not so much a fan of the idea of a gondola that only really services the ski resorts and is a pain to get to for most, because I'm worried a lot of people won't use it for that reason. The gondola will disrupt the views of the canyon, too, and I'm not a fan of increased bus service. As long as there isn't any lane widening or snow sheds built, I believe that widening and/or sheds will have too much of an impact on the natural environment and the other activities that take place in the canyon that there for some time that isn't resort use. I realize all increased service options have some kind of widening/shed built into the plan in order to minimize days when the canyon has to be closed, but I would rather have a closed canyon than room for more skiers in and a disrupted watershed. A zone national park model might not be feasible because of the cost/revenue/limitation of bus service available, but adopting a model as close to that as possible, along with express buses that go straight to the resort from the proposed parking structure at the base of Big Cottonwood as well as other places in the valley sounds like the best option to me. In the end, we shouldn't be making room for more cars, but instead making it more of an inconvenience to take a car (by instituting no winter road parking, lots in the canyon, etc.) than to take the bus. Buses are the future! Not a three or four-lane road in a canyon that we all love so much.</p> <p>As a rock climber who lives in the north of Little Cottonwood Canyon I believe it is important to protect the iconic climbing areas as well as the natural environment here. Plans to carve another lane through the canyon would likely destroy many climbing areas that are loved by both local and traveling climbers as well as access to these areas. In addition, both the gondola plan and the extra lane plan cause irreversible damage to our beautiful canyon. I support the enhanced bus Alternative without road widening because I believe it will cause the least amount of damage to the canyon while also decreasing traffic.</p> <p>Frankly the parking as it is today, is the Wasatch best chance at self-preservation. When it's full it's full. How much more beyond that it holds does Alta, Snowbird, Utah intend to cram into this space? A toll system will change behaviour - just look at Solitude. You can nearly double capacity by having 4+ persons per vehicle. Address demand through a tiered toll system that rewards 4+ with no toll and anything less has to pay. The fewer passengers the higher the toll. Toll systems are available that can track occupancy, automate billing and even identify pre registered cars with snowbird passes and direct those without proper tiers to paid toll over. All of this is far less expensive than any I've proposed options I know because I spoke to the toll companies, and Utah does too - the have HOV racking. But even before this focus on the busging, registered cars with snowbird passes and direct those without proper tiers to paid toll over. All of this is far less expensive than any I've proposed options I know because I spoke to the toll companies, and Utah does too - the have HOV racking. But even before this focus on the busging, Do the possible in the evenings. The avalanche gondola and snow sheds are not justified for the very few days gained by not having to shut down roads to clear them. Focus on what you can do now. If you want to make a study, put this in place and study the result. Get something going now that would make an immediate and real change, improve upon it as you learn.</p> <p>I live on Escalante Circle in Cottonwood Heights east of Wasatch Blvd from Golden Hills Drive. I am concerned about the UDOT plan to expand 2.2 miles of Wasatch Blvd through our community. This expansion is unnecessary. It will create more noise pollution and air pollution. More lanes of traffic idling in traffic during powder days when Little Cottonwood Canyon is closed. You created 2 lanes of traffic coming north on Wasatch Blvd from the High T intersection. Try getting into or out of our neighborhood from Golden Hills. This is the same road. UDOT does not seem to care about the fact that the state road goes through Cottonwood Heights. We live and work here. Please do not expand 2.2 miles of Wasatch Blvd for a few powder days. This is really a transit issue to get people up and down the canyon. Increases buses to get people out of their cars. We do not want a 5-7 lane highway dividing our community.</p> <p>Enhance Bus only. That is the best choice. More lanes is not acceptable. Jackson hole Resort had a 50% increase in Skiers. Without widening their road, it's still 2 lanes. Buses have been used not wider roads or a Gondola there.</p> <p>Resort Employees need to ride the bus to get to work. Tolling on high demand days with frequent buses will encourage transit. Destroying the Canyon for a problem that only lasts a few hours 10 days a year is insane.</p> <p>We desperately need a gondola system to see if the canyons. But because we would handle Cottonwood. They are very special places that only we can save. We need an investment now to save it for all of posterity.</p> <p>Section 1.3.4, under Estimated Impacts on Resources, states that "the amount of impacts will be determined by overlying the estimated right-of-way for each alternative on the GIS datasets for these resources." This is insufficient. Some impacts occur from a distance. Visual impacts on users of adjacent wilderness areas will not be captured by this methodology. For example, Perhaps there will be a hum from the operation of a gondola that will be audible for a long distance, and have distinctly negative impacts separate from road noise.</p> <p>Given that the purpose of improving transportation in Little Cottonwood Canyon is to improve the recreational experience (and getting one's destination without traffic delays will indeed be an improvement), any negative impacts on backcountry users must also be assessed. Very simply, I do not want to look at or near a gondola when I am hiking a snowshoeing. How frequent will that experience be? To say that the impacts only occur when the gondola is above designated wilderness is naive and unacceptable.</p> <p>At a minimum, the EIS must define the area where the gondola would be visible or audible. If there could be effects on wildlife, these should also be defined. For example, if the gondola would be sufficiently loud at the loading station (or anywhere else) such that it affects springtime mating of birds some distance away, that must also be captured by the analysis.</p> <p>Please do not widen the road. The canyon is beautiful and the bigger the road the more it will interrupt with nature. Instead increase the number of buses and require carpooling on busy days.</p> <p>The gondola option does not appear to take into account the time delay from waiting in lines at the transit hub and the gondola base station. Also, a fire in the canyon that shuts down the highway would also shut down the gondola, so a route over the backside to the Kimball Junction area would provide better emergency egress. Putting the base station near Kimball Junction would provide ample room for hotels, parking, etc. to turn it into a hub for skiing the Cottonwood Canyons, and much skier traffic could be routed from Salt Lake to Kimball Junction area via I-80. Finally, it would be worth considering the Loop tunnel system developed by Elon Musk's Boring Company as a much faster and higher-capacity route from Kimble Junction to the Cottonwood Canyons. The Loop system could transport people at 160 mph through the mountain, making it much faster to get from Salt Lake to Alta via Kimble Junction than it would be to drive up Little Cottonwood even on a low-traffic day.</p> <p>Dear Little Cottonwood Canyon,</p> <p>Please don't get destroyed and ruined!</p> <p>The best option is #1 - Least impact on the beauty of LCC! Do not widen road, increase ski buses on an as-needed basis. More ski buses on powder days...easy on, easy off, direct to Snowbird and Alta. Toll booth at the bottom for cars.</p> <p>Second choice is option #2 - add one lane to the road, increase ski buses on powder days...easy on, easy off, direct to Snowbird and Alta. Toll booth at the bottom for cars.</p> <p>Option 3# - Do not build a gondola! It will destroy the beauty of the canyon. It's not convenient...skiers/snowboarders will not park somewhere to take a bus to the gondola, to then make the long ride up. Not practical or fun to schlep around with skis, boots, poles, children, other gear, lunches, etc. People would rather drive and pay a toll for convenience and less hassle! People will still have to drive to go backcountry skiing or hiking or sightseeing in other areas.</p> <p>Best choice is to simply add more ski buses...have parking available at the Gravel Pit, 9400 South & Highland, SLC, Sugarhouse, Draper, Park City.</p> <p>Little Cottonwood Canyon does not want to be destroyed by a gondola and a wide road!</p> <p>Thank you!</p>	Nancy Hardy	Website
6431	I am gravely concerned about the proposed alternatives emphasis on maximizing ski resort traffic, at the expense of wilderness and backcountry recreation. <p>The Gondola Alternative completely dismisses all forms of non ski resort travel, is incredibly expensive, and vulnerable to weather closures.</p> <p>Avalanche mitigation should be given high priority, and snow shed seems to be the best option.</p> <p>I strongly encourage serious planning and consideration from non ski resort recreation in the final alternatives. Some factors that need to be addressed:</p> <p>Transportation options outside of normal times, such as early morning 'dawn patrols' or 'alpine stars' and night time 'apres ski.' The primary reason I never took the ski bus was because it did not run early enough or late enough.</p> <p>Access to formal and informal trailheads such as Gateway Butress, Tanners Gulch, Great White Icicle, Lisa Falls, White Pine, and Mount Superior, and Grizzly Gulch, to allow access to non resort recreation.</p> <p>Options for safe and protected bike lanes need to be considered, to maximize human powered transport options.</p> <p>Why don't you build and Alta pad for these rather than any tax dollars? I think all options are too focused on skiers and the ski season. Option 2 is garbage.</p> <p>I don't think any of these proposals really work, none of them are sympathetic to the environment of little Cottonwood canyon and will destroy the very thing people come to enjoy. Certainly not more road for cars & the gondola would be an eye sore and will not get people up the mountain at a reasonable rate. What about looking to Europe and how they cope - trains, tunnels?</p> <p>I missed some information when commenting earlier today. After reading more on this, I agree with the Salt Lake Climbers Alliance and would like to see one of the alternative options they've come up with.</p> <p>I vote (even though I know that's not how it works) for "enhanced bus with roadway widening." The mobility hub at the gravel pit NEEDS to happen. Snow sheds are essential to any plan (they work great literally everywhere else in the world). Additionally, this is the best option because it would allow access to trailheads for backcountry users and summertime use.</p> <p>However, I do urge you to come up with an interim solution. We should not wait until the end of the final EIS to start improving the bus system.</p> <p>It's a super big deal because of more season - but not so much a fan of the idea of a gondola that only really services the ski resorts and is a pain to get to for most, because I'm worried a lot of people won't use it for that reason. The gondola will disrupt the views of the canyon, too, and I'm not a fan of increased bus service. As long as there isn't any lane widening or snow sheds built, I believe that widening and/or sheds will have too much of an impact on the natural environment and the other activities that take place in the canyon that there for some time that isn't resort use. I realize all increased service options have some kind of widening/shed built into the plan in order to minimize days when the canyon has to be closed, but I would rather have a closed canyon than room for more skiers in and a disrupted watershed. A zone national park model might not be feasible because of the cost/revenue/limitation of bus service available, but adopting a model as close to that as possible, along with express buses that go straight to the resort from the proposed parking structure at the base of Big Cottonwood as well as other places in the valley sounds like the best option to me. In the end, we shouldn't be making room for more cars, but instead making it more of an inconvenience to take a car (by instituting no winter road parking, lots in the canyon, etc.) than to take the bus. Buses are the future! Not a three or four-lane road in a canyon that we all love so much.</p> <p>As a rock climber who lives in the north of Little Cottonwood Canyon I believe it is important to protect the iconic climbing areas as well as the natural environment here. Plans to carve another lane through the canyon would likely destroy many climbing areas that are loved by both local and traveling climbers as well as access to these areas. In addition, both the gondola plan and the extra lane plan cause irreversible damage to our beautiful canyon. I support the enhanced bus Alternative without road widening because I believe it will cause the least amount of damage to the canyon while also decreasing traffic.</p> <p>Frankly the parking as it is today, is the Wasatch best chance at self-preservation. When it's full it's full. How much more beyond that it holds does Alta, Snowbird, Utah intend to cram into this space? A toll system will change behaviour - just look at Solitude. You can nearly double capacity by having 4+ persons per vehicle. Address demand through a tiered toll system that rewards 4+ with no toll and anything less has to pay. The fewer passengers the higher the toll. Toll systems are available that can track occupancy, automate billing and even identify pre registered cars with snowbird passes and direct those without proper tiers to paid toll over. All of this is far less expensive than any I've proposed options I know because I spoke to the toll companies, and Utah does too - the have HOV racking. But even before this focus on the busging, registered cars with snowbird passes and direct those without proper tiers to paid toll over. All of this is far less expensive than any I've proposed options I know because I spoke to the toll companies, and Utah does too - the have HOV racking. But even before this focus on the busging, Do the possible in the evenings. The avalanche gondola and snow sheds are not justified for the very few days gained by not having to shut down roads to clear them. Focus on what you can do now. If you want to make a study, put this in place and study the result. Get something going now that would make an immediate and real change, improve upon it as you learn.</p> <p>I live on Escalante Circle in Cottonwood Heights east of Wasatch Blvd from Golden Hills Drive. I am concerned about the UDOT plan to expand 2.2 miles of Wasatch Blvd through our community. This expansion is unnecessary. It will create more noise pollution and air pollution. More lanes of traffic idling in traffic during powder days when Little Cottonwood Canyon is closed. You created 2 lanes of traffic coming north on Wasatch Blvd from the High T intersection. Try getting into or out of our neighborhood from Golden Hills. This is the same road. UDOT does not seem to care about the fact that the state road goes through Cottonwood Heights. We live and work here. Please do not expand 2.2 miles of Wasatch Blvd for a few powder days. This is really a transit issue to get people up and down the canyon. Increases buses to get people out of their cars. We do not want a 5-7 lane highway dividing our community.</p> <p>Enhance Bus only. That is the best choice. More lanes is not acceptable. Jackson hole Resort had a 50% increase in Skiers. Without widening their road, it's still 2 lanes. Buses have been used not wider roads or a Gondola there.</p> <p>Resort Employees need to ride the bus to get to work. Tolling on high demand days with frequent buses will encourage transit. Destroying the Canyon for a problem that only lasts a few hours 10 days a year is insane.</p> <p>We desperately need a gondola system to see if the canyons. But because we would handle Cottonwood. They are very special places that only we can save. We need an investment now to save it for all of posterity.</p> <p>Section 1.3.4, under Estimated Impacts on Resources, states that "the amount of impacts will be determined by overlying the estimated right-of-way for each alternative on the GIS datasets for these resources." This is insufficient. Some impacts occur from a distance. Visual impacts on users of adjacent wilderness areas will not be captured by this methodology. For example, Perhaps there will be a hum from the operation of a gondola that will be audible for a long distance, and have distinctly negative impacts separate from road noise.</p> <p>Given that the purpose of improving transportation in Little Cottonwood Canyon is to improve the recreational experience (and getting one's destination without traffic delays will indeed be an improvement), any negative impacts on backcountry users must also be assessed. Very simply, I do not want to look at or near a gondola when I am hiking a snowshoeing. How frequent will that experience be? To say that the impacts only occur when the gondola is above designated wilderness is naive and unacceptable.</p> <p>At a minimum, the EIS must define the area where the gondola would be visible or audible. If there could be effects on wildlife, these should also be defined. For example, if the gondola would be sufficiently loud at the loading station (or anywhere else) such that it affects springtime mating of birds some distance away, that must also be captured by the analysis.</p> <p>Please do not widen the road. The canyon is beautiful and the bigger the road the more it will interrupt with nature. Instead increase the number of buses and require carpooling on busy days.</p> <p>The gondola option does not appear to take into account the time delay from waiting in lines at the transit hub and the gondola base station. Also, a fire in the canyon that shuts down the highway would also shut down the gondola, so a route over the backside to the Kimball Junction area would provide better emergency egress. Putting the base station near Kimball Junction would provide ample room for hotels, parking, etc. to turn it into a hub for skiing the Cottonwood Canyons, and much skier traffic could be routed from Salt Lake to Kimball Junction area via I-80. Finally, it would be worth considering the Loop tunnel system developed by Elon Musk's Boring Company as a much faster and higher-capacity route from Kimble Junction to the Cottonwood Canyons. The Loop system could transport people at 160 mph through the mountain, making it much faster to get from Salt Lake to Alta via Kimble Junction than it would be to drive up Little Cottonwood even on a low-traffic day.</p> <p>Dear Little Cottonwood Canyon,</p> <p>Please don't get destroyed and ruined!</p> <p>The best option is #1 - Least impact on the beauty of LCC! Do not widen road, increase ski buses on an as-needed basis. More ski buses on powder days...easy on, easy off, direct to Snowbird and Alta. Toll booth at the bottom for cars.</p> <p>Second choice is option #2 - add one lane to the road, increase ski buses on powder days...easy on, easy off, direct to Snowbird and Alta. Toll booth at the bottom for cars.</p> <p>Option 3# - Do not build a gondola! It will destroy the beauty of the canyon. It's not convenient...skiers/snowboarders will not park somewhere to take a bus to the gondola, to then make the long ride up. Not practical or fun to schlep around with skis, boots, poles, children, other gear, lunches, etc. People would rather drive and pay a toll for convenience and less hassle! People will still have to drive to go backcountry skiing or hiking or sightseeing in other areas.</p> <p>Best choice is to simply add more ski buses...have parking available at the Gravel Pit, 9400 South & Highland, SLC, Sugarhouse, Draper, Park City.</p> <p>Little Cottonwood Canyon does not want to be destroyed by a gondola and a wide road!</p> <p>Thank you!</p>	Lucy Call	Website
6432	I have done my research and I strongly support the enhanced bus option with no road widening. I believe this option is the most responsible and effective first step to solving the problem in LCC. It's the most minimally invasive to the nature and wildlife of LCC, the most cost effective and most EFFICIENT way to MOVE MORE PEOPLE IN FEWER VEHICLES which will result in less congestion on peak snow days... the problem we are trying to solve. <p>Generally speaking, I support a solution such as the Gondola plus La Caille option proposed by Gondola Works. This being said, I don't support any solution that detracts from the community of Cottonwood Heights. Widening Wasatch for some potential 2050 evening traffic scenario seems short sighted and inappropriate. If the gondola works option has a negative impact on Cottonwood Heights, I might have a harder time supporting it. Additionally, the existing UDOT gondola option is a non-starter.</p> <p>I have done my research and I strongly support the enhanced bus option with no road widening. People will still have to drive to go backcountry skiing or hiking or sightseeing in other areas.</p> <p>Best choice is to simply add more ski buses...have parking available at the Gravel Pit, 9400 South & Highland, SLC, Sugarhouse, Draper, Park City.</p> <p>Little Cottonwood Canyon does not want to be destroyed by a gondola and a wide road!</p> <p>Thank you!</p>	Courtney Howard	Website
6434	I grew up in Sandy and consider LCC my spiritual home. LCC was my first exposure to hiking, rock climbing, mountaineering, and backcountry skiing. <p>I am gravely concerned about the proposed alternatives emphasis on maximizing ski resort traffic, at the expense of wilderness and backcountry recreation.</p> <p>The Gondola Alternative completely dismisses all forms of non ski resort travel, is incredibly expensive, and vulnerable to weather closures.</p> <p>Avalanche mitigation should be given high priority, and snow shed seems to be the best option.</p> <p>I strongly encourage serious planning and consideration from non ski resort recreation in the final alternatives. Some factors that need to be addressed:</p> <p>Transportation options outside of normal times, such as early morning 'dawn patrols' or 'alpine stars' and night time 'apres ski.' The primary reason I never took the ski bus was because it did not run early enough or late enough.</p> <p>Access to formal and informal trailheads such as Gateway Butress, Tanners Gulch, Great White Icicle, Lisa Falls, White Pine, and Mount Superior, and Grizzly Gulch, to allow access to non resort recreation.</p> <p>Options for safe and protected bike lanes need to be considered, to maximize human powered transport options.</p> <p>Why don't you build and Alta pad for these rather than any tax dollars? I think all options are too focused on skiers and the ski season. Option 2 is garbage.</p> <p>I don't think any of these proposals really work, none of them are sympathetic to the environment of little Cottonwood canyon and will destroy the very thing people come to enjoy. Certainly not more road for cars & the gondola would be an eye sore and will not get people up the mountain at a reasonable rate. What about looking to Europe and how they cope - trains, tunnels?</p> <p>I missed some information when commenting earlier today. After reading more on this, I agree with the Salt Lake Climbers Alliance and would like to see one of the alternative options they've come up with.</p> <p>I vote (even though I know that's not how it works) for "enhanced bus with roadway widening." The mobility hub at the gravel pit NEEDS to happen. Snow sheds are essential to any plan (they work great literally everywhere else in the world). Additionally, this is the best option because it would allow access to trailheads for backcountry users and summertime use.</p> <p>However, I do urge you to come up with an interim solution. We should not wait until the end of the final EIS to start improving the bus system.</p> <p>It's a super big deal because of more season - but not so much a fan of the idea of a gondola that only really services the ski resorts and is a pain to get to for most, because I'm worried a lot of people won't use it for that reason. The gondola will disrupt the views of the canyon, too, and I'm not a fan of increased bus service. As long as there isn't any lane widening or snow sheds built, I believe that widening and/or sheds will have too much of an impact on the natural environment and the other activities that take place in the canyon that there for some time that isn't resort use. I realize all increased service options have some kind of widening/shed built into the plan in order to minimize days when the canyon has to be closed, but I would rather have a closed canyon than room for more skiers in and a disrupted watershed. A zone national park model might not be feasible because of the cost/revenue/limitation of bus service available, but adopting a model as close to that as possible, along with express buses that go straight to the resort from the proposed parking structure at the base of Big Cottonwood as well as other places in the valley sounds like the best option to me. In the end, we shouldn't be making room for more cars, but instead making it more of an inconvenience to take a car (by instituting no winter road parking, lots in the canyon, etc.) than to take the bus. Buses are the future! Not a three or four-lane road in a canyon that we all love so much.</p> <p>As a rock climber who lives in the north of Little Cottonwood Canyon I believe it is important to protect the iconic climbing areas as well as the natural environment here. Plans to carve another lane through the canyon would likely destroy many climbing areas that are loved by both local and traveling climbers as well as access to these areas. In addition, both the gondola plan and the extra lane plan cause irreversible damage to our beautiful canyon. I support the enhanced bus Alternative without road widening because I believe it will cause the least amount of damage to the canyon while also decreasing traffic.</p> <p>Frankly the parking as it is today, is the Wasatch best chance at self-preservation. When it's full it's full. How much more beyond that it holds does Alta, Snowbird, Utah intend to cram into this space? A toll system will change behaviour - just look at Solitude. You can nearly double capacity by having 4+ persons per vehicle. Address demand through a tiered toll system that rewards 4+ with no toll and anything less has to pay. The fewer passengers the higher the toll. Toll systems are available that can track occupancy, automate billing and even identify pre registered cars with snowbird passes and direct those without proper tiers to paid toll over. All of this is far less expensive than any I've proposed options I know because I spoke to the toll companies, and Utah does too - the have HOV racking. But even before this focus on the busging, registered cars with snowbird passes and direct those without proper tiers to paid toll over. All of this is far less expensive than any I've proposed options I know because I spoke to the toll companies, and Utah does too - the have HOV racking. But even before this focus on the busging, Do the possible in the evenings. The avalanche gondola and snow sheds are not justified for the very few days gained by not having to shut down roads to clear them. Focus on what you can do now. If you want to make a study, put this in place and study the result. Get something going now that would make an immediate and real change, improve upon it as you learn.</p> <p>I live on Escalante Circle in Cottonwood Heights east of Wasatch Blvd from Golden Hills Drive. I am concerned about the UDOT plan to expand 2.2 miles of Wasatch Blvd through our community. This expansion is unnecessary. It will create more noise pollution and air pollution. More lanes of traffic idling in traffic during powder days when Little Cottonwood Canyon is closed. You created 2 lanes of traffic coming north on Wasatch Blvd from the High T intersection. Try getting into or out of our neighborhood from Golden Hills. This is the same road. UDOT does not seem to care about the fact that the state road goes through Cottonwood Heights. We live and work here. Please do not expand 2.2 miles of Wasatch Blvd for a few powder days. This is really a transit issue to get people up and down the canyon. Increases buses to get people out of their cars. We do not want a 5-7 lane highway dividing our community.</p> <p>Enhance Bus only. That is the best choice. More lanes is not acceptable. Jackson hole Resort had a 50% increase in Skiers. Without widening their road, it's still 2 lanes. Buses have been used not wider roads or a Gondola there.</p> <p>Resort Employees need to ride the bus to get to work. Tolling on high demand days with frequent buses will encourage transit. Destroying the Canyon</p>		

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6447	<p>Though an avid skier myself, this problem seems to affect, on the whole, a small group of people for a relatively short period of time (a couple of bad traffic days) each year. Drastic measures like building a new lane up the canyon or building a gondola should not be considered before significant efforts are made to better work with the system already present.</p> <p>We already have a road going up the canyon and a bus system that is already in place, even if it's not working as well as we would hope. But before we go digging a new lane or installing a gondola, both of which could cause irreversible environmental damage, why don't we work with what we already have and increase the number of buses going up the canyon and see if that works?</p> <p>Adding a new lane would decrease the available roadside parking for the length of Little Cottonwood Canyon Road, which will either lead to more parallel parking on the side of the road (potentially dangerous) or pushing back trailheads further into the forest. A gondola could create problems for wildlife and infringe on the areas of the canyon that remain relatively unaffected by motor vehicles and machinery.</p> <p>I'd love to get up the canyon a bit faster on those powder days, but I'm not willing to trade the decreased commute time for the multi-faceted effects that a new lane or a gondola might cause.</p> <p>We do need to mitigate the traffic problem, and we can do that with enhanced bus service and high tolls for days with potentially significant backups.</p>	Alex Sun	Website
6448	I believe that more frequent buses and better public transportation are the best option for LCC.	Kira Crowell	Website
6449	I support enhanced bussing - more bussing.	Koly Swistak	Website
6450	<p>Hello, my name is Mark Equinozzi. I moved to SLC at age 17 and have lived here for the past 11 years. I married my wife here and just bought a house in Holiday and are expecting our first child in October. This is my favorite place in the world and I love the Wasatch more than anything. Within 15 mins I can be bouldering, hiking, flyfishing, or scrambling, it is a truly unbelievable place to be.</p> <p>Below is just a recommendation. I'm going off what I have researched and how I feel about our mountains.</p> <p>The point of my suggestion is not to isolate people based on not being able to afford access but rather to empower more of our community to gain access while also doing what's needed to preserve our mountains. In a perfect world, the mountains have free access, no fees, no need for regulation, everyone respects and helps take care of our backyard. But to me, the harsh reality is people won't do that and I see it more and more up the canyon.</p> <p>This does not need to be a negative thing and how people take it will depend entirely on how you deliver the message. We are opening the Wasatch to the masses & protecting it at the same time. Granted as much as I LOVE being alone on the slabs or superior I understand the necessity of people having access to the Wasatch. If you do not get to use the mountains and you don't have a way to get there, why would try to help? You wouldn't. With only 4% of our population utilizing the mountains yearly and our population growing so quickly we need to act now before the damage is irreversible and we have lost what makes this amazing city so unique.</p> <p>I hope my above thoughts help preface this plan in the correct light:</p> <p>BUS SYSTEM I believe we should adopt a platform similar to a national park. -During peak times busses run every 15min. -Stops depend on the time of the year. -Busses have a separate lane at the entrance, they must have quick and easy access. -Buses are the same price as normal public transportation in slc (or free). -Create a city bus system that drops off at the base.</p> <p>PREMIUM PASSES I believe you should provide the ability to buy access by car. -Pass is priced 500-750 for the year and you get unlimited access. -Provides funding for the BUS SYSTEM so others can enjoy it. -Cars can drive in for day passes.</p> <p>BUILD INFRASTRUCTURE -Build out gates for cars to enter canyons. -Build out the base of canyon with a parking garage.</p> <p>I know the above probably sounds crazy but I think with the correct strategy of marketing and funding you can break through to the public. People want to help and want to be part of the solution but only if they are included in the reward. If you increase the number of people using the mountains you increase the support for the mountains.</p> <p>Stroke a few local wealthy guys egos and get some bigger names behind it. Use it as a chance to provide a large tax write off and get social recognition and people will join. Back that up with a robust gorilla effort and I think you can make it happen.</p> <p>Thanks for listening to my rant. I wish you the best and hope we can all make the Wasatch a better place in the coming years.</p>	Mark Equinozzi	Website
6451	As a rock climber and skier who often visits Little Cottonwood Canyon, I believe it is important to protect the iconic climbing areas and the unique environment that thrives. Plans to carve another lane through the canyon would likely destroy many climbing areas and destroy habitable places for animals already at risk of having their land encroached on. In addition, both the gondola plan and the extra lane plan cause irreversible damage. I support the Enhanced Bus Alternative without road widening because I believe it will cause the least amount of damage to the canyon while also decreasing traffic. It will also encourage more people to take the bus, as well as benefit students who have UTA fees in their student fees.	Alyssa Le	Website
6452	The issues is to many cars up the canyons. We need full cars and more buses. Not more roads not a Gondola. Those buses need to leave from places around the valley that have ample parking. Also the tax payers should not have to pay / support the ski resorts.	Kurt Kohler	Website
6453	I support Alternative 1 (Enhanced bus service without road widening). I primarily go to Little Cottonwood Canyon to climb, run, and hike. As such, the alternative that provides access to the various climbing areas low in the canyon and hiking trails and does not disturb any of the boulders is preferred. Alternative 1 appears to meet my needs to best. Of the greatest importance is limiting impacts to boulders, of which several are close to the road and could be damaged/removed if road widening is required.	Douglas Oliver	Website
6454	I am in favor of expanding transit systems, NOT lane additions or gondola, because it is the most practical solution based on the current infrastructure. The canyons are multi-use year-round, which a gondola does not fully Accommodate for. Adding lanes to the roadways sacrificed too much of the natural value of the Wasatch, which is already in jeopardy. We have a bus system, so why not just fix it's flaws and connect More people to the system, preventing the number of cars in the Canyons and on the roadways overall.	Logan Hastings	Website
6455	Bottom line: UDOT needs to add an alternative to solve the traffic problem that does not cost the tax payers a single dime. The three "alternative" are all variations on the same theme. There is no real choice. UDOT has eliminated all the other real choices.		
6455	Typical UDOT. The alternatives are narrow and all are terrible. Another agency needs to take the lead on solving this problem. As long as UDOT is in charge, the only choice is how much more infrastructure is built in the canyon. Adding more infrastructure will not solve the problem. It is like an obese person buying bigger pants and thinking it solves their weight problem. The traffic problems are caused solely by the two ski resorts. They are private businesses. They make hundreds of millions of dollars in profit. Not a single dime of taxpayer money should be used to resolve a problem that the resorts intentional created so that they could make more money. The ski resorts can fix the problem they created at no cost to the taxpayers, but they would rather get a multi-billion dollar taxpayer subsidy. They seem to have UDOT in their back pocket. Why has UDOT not included a resort funded solution as an alternative? It is criminally wrong that you have not done so. You need to do this. You need to have a wide range of options for the public to consider, not three variations of the same theme. The traffic problems are caused by the fact that the resorts have their parking lots in the wrong place. It is that simple. The parking lots are at the base of the ski lifts. The resorts should close all their parking lots and build them where they belong... in the Salt Lake Valley. If you want to ski at a resort (or work there) you need to take a bus to and from the resort from the valley. This solution does not require any taxpayer money/subsidy/bailout of the resorts. The cost would be borne where it belongs: by the resorts and those who ski there. No road widening would be needed. No silly (and UGLY) gondola (is it going to stop in high winds? How do you rescue people?) Let the resorts buy/build parking spaces in the Valley and shuttle people up to the resort. Sure it will cost them millions and may be difficult to do, but they should rightfully bear that burden and they are smart and they have millions of dollars to invest in doing this. Taxpayers should not fund this. UDOT needs to add this as an alternative for the public to consider. Of the three "choices" provided, the Enhanced Bus Alternative (without roadway widening) is the least terrible, but it is still terrible.	Eric Hobday	Website
6456	Personally, good thoughts but you are forgetting that there are other areas than 2 private ski resorts. Why are we spending 100s of millions of dollars on access to private businesses without improving access to touring areas as well. I think limiting the number of people per day that attend resorts is the first step. Then we worry about alternatives.	Cabot Steward	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6457	<p>SOLUTIONS or SPECULATION. Sometimes criticism is in order for one to see more clearly.</p> <p>It is both laughable and alarming that UDOT would devise and propose such a project scope as to appease private interest, that entails expending hundreds of millions of dollars (of public, tax payer dollars) for construction of a gondola to serve ski resorts desire to increase patronage, and widening of Wasatch to Neiderhauer's desires to deliver patrons to his planned Ski village development for the LaCallie property. If you think residents are not savvy to the upcoming developer desecration of this area, guess again. ODUT ought to be truly ashamed to roll out these horrific solutions to public. UDOT has vested interest in "selling" these investor ideas, particularly since UDOT is poised to cash in as well. While private sector investors stand to profit while local areas resident lose BIG! Are these projects necessary? And, more to the point, do these proposals fit within the scope and plans of local communities that will be impacted by these developments.</p> <p>How convenient of UDOT to drop John Thomas (former EIS project manger) from the EIS project after he committed, on behalf of UDOT, to lower speeds on Wasatch to 35MPH, by creating a revised design speed for Wasatch Blvd/SR210 using traffic calming measures and creating a scenic highway. That is the Wasatch Blvd residents were sold, July 2019. How convenient it is for UDOT to just pull the plug on community concerns for safety, and force-feed 7 LANES of TRAFFIC, 1-2 miles of road-widening, for NO APPARENT REASON, other than to steer patrons to the planned Neiderhauer Ski village and gondola station. UDOT, you have pipped yourself to private investment interest, and it's blatantly obvious UDOT is following the MONEY, too - grabbing for large scale FUNDING while irreversibly destroying local area neighborhoods, degrading safety, increasing traffic, and impacting both air quality and noise pollution in the process. YAY YOU, UDOT.</p> <p>UDOT is CHASING THE BIG MONEY: No one is a stranger to understanding the process whereby tax payer funds get directed to udot for projects: First the agency must create "perceived need", then support said need with creative statistical data that point towards prescribed outcome; litter it lots of studies, to the point that public is overwhelmed and won't bother to analyze details or pose questions; and, finally create solutions that promote the "desired outcome", then seek funding. It is well known that agencies and the state are pushing the "Growth" agenda: CWC, WFR, Envision Utah. Utah has a few economic drivers, and Ski industry is a tourism cash cow. Introduction of Ikon and Epic passes have shown ski industry the means to reap profit with projected growth, and they are ready to cash-in. Yet, neither Snowbird nor Alta will pitch one \$1.00 into the pot to fund these projects, either. Rather, they intend to being home the bacon on TAX payers dollars to secure future profits.</p> <p>The solutions presented have more failures than salvageable aspects, imo, so with that:</p> <p>NO GONDOLA: The gondola is the most ineffective and inefficient solution to move patrons to resorts during winter months. It is unsafe, there are no contingency plans presented for emergency rescue, during power outages or high wind shut down. There will be need to clear-cut forest for its installation, along with emergency and tower maintenance access points en route. And, the suggested, estimated, guesstimated travel times and logistics of the study are unsubstantiated, and ridiculous, guesswork at best. There is no viable "last mile" solution presented for local areas residents, who will be forced to drive 1-3 miles to a transit hub, pay to park, then take a bus, then transfer to a gondola. At min. an anticipated 1.5 hours travel time for local areas residents can be expected, with min. of 2 transfers, after driving and parking a car, if on schedule. Whereby to compare current trip time, by car or bus, up-canyon travel time is approx 17-20 minutes, during normal conditions. I hesitate to ask, but are there actual "planning" engineers working at UDOT, as these solutions seems more poorly contrived than what interns could come up with. Roles of Planners and Engineers are higher differentiated, nothing has yet been engineered, which leaves more question than answers to public. Nothing about these presented solutions seem resolved, nor logical, and this is long after UDOTs been dragging its feet in this process for the past few years. The costs for the Gondola is a monumental waste of tax-payers dollars, it is simply not the most effective nor efficient solution to transport people. The gondola is seasonal use, and does not address nor meet needs of back country skiers, nor will it have mid-point stops, nor summer use for hikers and mountain bikers.</p> <p>The gondola solution appears purely out of a greed-driven investor agenda, and UDOT, as public agency, has allowed itself to succumb to those "stakeholders" whims with complete disrespect to local areas residents and the negative impacts such a project will inflict upon the local area, and with disrespect to local and regional master and general plans for the area. There are no local area master or general plans that include use of a gondola in any capacity, so how did it end up in your solutions. By its inclusion in UDOT's solutions, you are creating changes to local and regional plans that do not call for a gondola; its inclusion obviously caters to speculative development plans of private sector interests. For a public agency such as UDOT to align itself with private sector interest over the public interest raises question for concern. Alternatives: Dare to consider for a moment that a rail system will deliver folks to resorts efficiently, and can be designed with mid-point stops and year-round use. Perhaps UDOTs negate to consider rail system because Doppelmayr (the gondola company) does not yet have a rail system that will work for this purpose... too bad, shop it around. They are not the only game in town so to speak, though, literally they are (since they located USA headquarters here for this very purpose). Initially, and more to the point of functional, low costs solutions, the use of buses present the most flexible plan, and are the obvious solution. The implementation of snow sheds, in respect to safety on the canyon road, are warranted. Snow sheds can be designed aesthetically to blend into natural landscape, and can serve dual purpose functionality as wild life crossings. Suggest to start here, and study this process as to what ultimately can solve any "perceived" traffic issues, this is a best-practices approach.</p> <p>Will also interject, as I have in past, to change current snow tire laws - to demand all vehicles traveling up both canyons to be equipped with either Chains, or Mountain/Snow rated tires," and do not allows M+S rated tires as satisfactory for canyon driving, which is the current status of this law. You have \$66 mill to study, suggest to look it up - plenty of studies on differences in traction between these tire types for severe winter driving. Frankly, with your \$66 mill study money you could buy all winter ski-pass holders, resort employees, and tourism travelers into the canyons a real nice set of true winter snow rated tires (they last average 4-5 season). Dare conduct this study, and let's see how the number of car slide off incidents drop. Canyon traffic congestion loading/unloading in inclement weather is 99.9% result of vehicle slide offs. Let's please stop allowing this easily remedied safety issue to persist year after year.</p> <p>NO WIDENING WASATCH TO 5 OR 7 LANES. Widening of Wasatch Blvd/SR210 has far too long been the largest point of contention with local area residents, with both their mayor and council reps, and UDOT, in respect to safety of residents as they ingress/egress adjoining neighborhood streets that feed onto Wasatch Blvd. The consensus is that residents struggle to safety exit/enter neighborhoods currently with a 2 LANE road and 50 mph speed limit, it is simply unsafe. If UDOT bothered to acknowledge the numerous comments it has received on this very topic, you'd know and address it accordingly. Not addressing known safety issues is pure negligence on your part. Is Udot willing to assume the liability for accident and resulting deaths that occur due to known road safety issues? The High-Tee project of 2017 only served to further reduce safety along Wasatch, and failed to even address cycling and pedestrian safe passage through that intersection in its design conception. Your agency has obligation to increase safety, not decrease road safety. Adding a light for cyclists to cross thru the high-tee was a last ditch effort demanded by local residents to get some form of cycling safety, that element was clearly left out of UDOT's design plans, and you were happy to build it as planned. Shameful. UDOT, by its own admission, has noted publicly that the intersection fails, and is already looking to redesign the high-tee, in all confirming UDOTs inability to actually skillfully engineer a basic intersection, not to mention another huge waste of tax payer money. Be it Federal, State, County, or City, the funding UDOT receives for project is PUBLIC TAX PAYER MONIES collected through taxation. UDOT's priority of response therefore is to PUBLIC LIFE, SAFETY, WELFARE, not private investor interest.</p> <p>The last few years area residents braced themselves for the worse, in respect to Wasatch widening plans, pleaded with city council and mayor to not allow area neighborhoods to succumb to road widening, which would ultimately degrade safety and severe the community. Residents have engaged repeatedly thru open houses, design charrettes (another monumental waste of time and expense) demanding the road remain 2 lanes, or possibly to add a reverse bus/mass transit lane to appease intermittent winter peak time ski traffic, but above all to reduce the speed limit, to 35MPH, through implementing design speed changes, and add traffic signals where necessary to reduce risk of injury to drivers(Kings Hill). UDOT at least, in superficial appearances, over the past 2-3 years, seemed attentive to residents concerns, and even made a commitment to local residents to work to increase safety along Wasatch by reducing the speed on Wasatch to 35MPH. Fast Forward, to the "revised" EIS solutions you still maintain the 50MPH, in all 3 solutions, and fail to even acknowledge the 2 July 2019 commitment to local area residents to increase safety through speed reduction on Wasatch. For an agency with a "Zero Fatalities" goal, you seem hell-bent to force accidents and potential injury/loss of life in presenting these new solutions, all of which widen Wasatch, be it 3, 5 or 7 lanes and, still maintain 50 MPH (and, to enlighten local area residents: 12' shoulders are LANES, Buses on shoulder will require 12' width by Fed mandate, so yeah... who are you kidding calling a shoulder a bike lane?). Straightening Wasatch Blvd at Kings Hill will require the destruction of area residents, their homes will get destroyed, you've already black-listed those homes from market.</p> <p>The section of Wasatch Blvd/Sr210 discussed is a mere 1-2 miles, to widen it serves no useful, nor logical purpose other than to force MORE cars into the area unnecessarily, shifting the bottle neck south. By your admission, you stated the road widening was not in respect to ski traffic, but to alleviate commuter traffic. Yet, because you have no jurisdiction over Wasatch south of the high-tee you have no ability to widen that section for the very reason you claim the 1-2 miles demands widening... so, you are alleviating nothing, your thinking process is illogical, and irrational. Factoid: Wider Roads and more lanes induce MORE cars and congestion. You cannot encourage and expect increased alternative transportation use when you open up the road to invite more cars, it's contradictory, and rather illogical. Udot seem reluctant to utilize the \$66 mill to study the Highland bridge and widening option to appease local commuter traffic, without reasonable explanation to public. Unless, of course, your desired outcome in widening Wasatch is to appease investor interest, such as steering as many cars as possible into a future Ski Village commercial development, such as Neiderhauer's plans currently being floated for the redevelopment of the La Callie property, (sorry to repeat, just wanted to make it blatantly clear, public is aware of the intentions of these proposed solutions.)</p> <p>Choke in this. More lanes means more cars idling, rather than 1 lane of cars idling along the road during canyon closure days, there will be 2 to 3 LANES of vehicles spooling emissions waiting for canyons to open, or roads to clear. Where are the Environmental Air Quality impact studies and reports? UDOT has \$66 million to study and scope this project, yet not one single \$1.00USD was spent to set up A/Q Monitor stations along Wasatch over the last year, despite residents demanding it to do so, repeatedly. Air quality degradation presents a huge health concern, and you have failed to provide any tangible proof that widening Wasatch will not negatively impact Air quality. With that, I will request, again, UDOT to conduct a year-long study that includes peak winter season, and evaluate Air Quality based upon actual results, and do a comparative projection to the planned added lanes to Wasatch, perhaps using Bangeter Hwy on same given days. The other Environmental Impact Study you have casually FAILED to produce is that of NOISE POLLUTION. Please present public with a comprehensive Sound study for local area residents, on increased noise levels when you Widen Wasatch Blvd to 5 or 7 LANES. And, include the Sound Study for the current road design speed of 50 MPH(as it is today), and the desired design speed for the road at 35MPH as preferred by local area residents - spoiler alert - the difference will be staggering. Hardscape, i.e. concrete/asphalt, and massive areas of it only serve to amplify sound as do increased speeds on roads. Road Noise dissipates almost 40-50%, when dropping from 50MPH to 30MPH. Take time to look it up with your \$66 mill study money. Perhaps to get a real life perspective, take a tent and sleeping bag and camp out along Bangeter Hwy for a few days to conduct a sound study.</p> <p>What you are proposing with widening of Wasatch Blvd/SR210 for the small residential area in Cottonwood Heights, is nothing more than a road of Bangeter Hwy proportion, scale, and speed. It is inappropriate, and serves no purposeful function other than to shove a bottleneck a few miles south. If widening the road was such a logical solution then why does your solution not propose to widen Wasatch/SR210 all the up to the mouth of LCC 7 LANES, and why stop there, why not widen the canyon road to 5 lanes right on up to Snowbirds parking lot? The illogical approach UDOT has taken to this project just validates that UDOT is only seeking to secure large scale funding for its agency into future, and position itself to enable private interest projects, at expense of TAX PAYERS.</p> <p>NO TO OVERHEAD BRIDGES: You're vision of Wasatch/SR210 is that of Bangeter, if you measure success by how many cubic feet of concrete you can pour through an area... then well, you have succeeded. Widening Wasatch/SR210 severs community and neighborhoods, and cuts-off east bench residents from its city. Bridges only serve to band-aid poorly planned solutions. Overhead bridge aesthetics = fail, they will be littered with plastic cups and political signs.</p> <p>Walk-ability and Bike-ability are completely missing from your solutions. Your solution forces cyclists to co-mingle with buses in a 50 MPH unprotected lane. You clearly spent effort determining costs for purchasing the houses necessary to mow down for road widening, road, and gondola costs, and frankly UDOT you seem myopically focused on the gondola, speed, and road capacity.</p> <p>FULL COMMENT AVAILABLE ON PAGE XXX</p>	Kim Simons	Website/Email

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	<p>I include these these comments by the Wasatch Backcountry alliance and am in agreement with them.</p> <p>Wasatch Backcountry Alliance (WBA) envisions a low cost, low emission, energy efficient year-round multi-modal transportation scenario for improving the current traffic situation in Little Cottonwood Canyon (LCC). The system we envision must be capable of providing efficient and predictable service for travel to both developed locations (ski resorts) and to trailheads and other stopping points for dispersed use in LCC. Any improvements being made in LCC should be tied in to a larger transportation system that serves and benefits the entire Central Wasatch." To that end, with regard to the current LCC EIS, WBA supports enhanced busing with no widening of Highway 210.</p> <p>WBA firmly believes that before any transportation system is selected, there must be a thorough analysis of the carrying capacity of Little Cottonwood Canyon. This will help establish the volume of people that need to be moved up and down the canyon, which will invariably help determine which transportation system best fits that purpose and need. WBA strongly encourages UDOT to work with other stakeholders, including the US Forest Service and Salt Lake County, to undertake a carrying capacity analysis and to make that part of the current EIS.</p> <p>With regards to the two options that use more buses (extended bus service and widening of the LCC road to accommodate yet-more buses), WBA continues to support the same concept that we stated in our May 2018 Scope and Need comment: "The transportation system should use the best currently available technology to serve all user groups on a year-round basis. WBA believes that the best currently available technology that meets our criteria is a flexible and dynamic fleet of energy efficient buses and vans using a series of transportation hubs." At this point in time, we do not think that Highway 210 should be widened to accommodate more vehicles, but that having dedicated times for buses and cars with 4 people (ie. 7-9am and 3-5pm) should be more thoroughly explored.</p> <p>The most-recent EIS document clearly reflects a lot of work done on the part of UDOT, but it also generates many questions and we feel there are some important fundamental flaws that should be addressed. To that point, we have some comments about what we regard as key issues with this EIS:</p> <p>The current EIS does not address the concept of multiple Mobility Hubs other than the one on 9400 South and the one at the Gravel Pit. WBA thinks that the transit system needs to originate at locations around the valley (ie. U of U/Foothill, downtown, airport, WVC, Draper, West Jordan and points farther south, etc.) so that people can access the bus where they live, rather than drive their car to a mobility hub to catch the bus. When faced with this choice, we suspect many people will choose to remain in their cars rather than use the bus. There is very little discussion of the needs of non-ski resort, dispersed users (in particular with regards to the White Pine trailhead, which has already increased in use to the point where it's dangerous due to on-highway parking in both summer and winter). We do not see any financial life cycle analysis (capital and operation, maintenance) of any of the options presented over the projected timeframe. Given that the least-expensive option will come at a cost of ~\$100 for every single Utahn, this is relevant). There is no mention of any interim solutions, and according to a UDOT spokesperson, UDOT has "no idea" what to do in the interim, nor are there any approximate timelines to actually identify what the "interim" is. LCC is facing an acute problem now that will only worsen, and the lack of timelines is a major missing component of the EIS.</p> <p>There is only token consideration given to the effects of each of the options on the vital LCC watershed, either by construction or ongoing use.</p> <p>There is very little/no mention of tolling on vehicles, though it is our understanding that the Utah state legislature specifically allocated considerable monies to UDOT to consider tolling, and as noted above, the Wasatch Backcountry Alliance is a proponent of tolling.</p> <p>The EIS provides no rationale for UDOT's winnowing of 35 different options to these three. Based on our review of the EIS, the focus of the document and the tone of the online meetings on June 23-24, despite there being three alternatives in the EIS, it seems that the gondola option is being pushed as the preferred option. While we recognize that there may be potential benefits of a gondola operation, there are important components of it that we take issue with:</p> <p>Volume – the gondola as proposed will only carry about 1/3 of those people heading up LCC. This means that 2/3 will still be on the LCC road, so how does installing a gondola at cost of ~\$400M make any sense if it will not help alleviate the traffic issue currently plaguing LCC and the surrounding Sandy and Cottonwood Heights communities?</p> <p>Summer use - We understand that an important need of the EIS is to address the peak use times during the winter. However, traffic (and parking) in LCC is an issue year-round, and traffic-related issues are not limited to peak/storm periods. Summertime traffic as it relates to bicyclists needs to be addressed, particularly in the early fall when Snowbird's two-month long "Oktoberfest" is in full swing, given that event has a large focus on drinking alcohol at the top of a steep windy canyon.</p> <p>Schedule – Backcountry enthusiasts, employees, and contractors travel the canyon at all hours. Scheduling gondola availability for only the peak skiing hours transforms it from a transportation solution to a taxpayer-paid ski lift that benefits two private companies that operate largely on public land.</p> <p>Fees – there was no mention of the potential costs to riders. If fees are prohibitive, the system won't be utilized. Given the vast majority of people riding a gondola will be going to the ski areas, will the ski areas supplement/offset the cost of the gondola as they currently do with the bus?</p> <p>Roadway use – will vehicles driving up the canyon be tolled? The state legislature allocated a lot of taxpayer dollars towards the concept of tolling, and creating financial disincentives to drive up the canyon and use the gondola (or any transit system) is imperative. This could also include paid parking in all of upper LCC (ie. starting at Snowbird Entry 1).</p> <p>While fees and schedules could easily be considered TBD details and perhaps that is why they were not included, the gondola's schedule and fees are essential components to its success.</p> <p>Highway 210 improvements – there was no mention of improvements to Hwy 210 in addition to the gondola. For service vehicles, delivery trucks, residents, emergency vehicles, and those who don't use the gondola, the threats that the canyon represents will still exist. For example, if the gondola is chosen, will any improvements be made to Hwy 210, ie. snowsheds?</p> <p>UTA buses – there was no mention of bus service; again, perhaps a TBD detail, but given the continued growth in use, there is no doubt that bus service will be an important component as well even if the gondola is chosen given that a majority of people will still be traveling up LCC on the road.</p> <p>Convenience of travel – the three-step process for getting up the canyon using the gondola (drive your car to one of two intermodal hubs, put on your ski gear (plus potentially help your kids with their gear) to get on a bus, get off the bus to get on the gondola, and finally get off the gondola to ski, knowing in the back of your mind that you will have to reverse this process in a matter of hours) will create awkwardness at best and a strong disincentive to many at worst. There needs to be a better way to get people from where they live to the gondola terminal, including a regional transit system from across the SL Valley and potentially additional parking at the gondola itself. It's important for UDOT to understand that skiers and other mountain-lovers have a typically-irrational perspective on time/efficiency of access; "Powder Fever" is a real thing, and the prospect of using three modes of transit, taking at least 90 minutes, just to get to the ski area will be a strong disincentive for many.</p> <p>Parking/traffic – a bottom terminal at the mouth of LCC will create the same traffic and congestion issues that prompted the closure of the existing parking lot to UTA bus service. When coupled with buses trying to deliver people to the gondola and vehicles traveling up the canyon, could adding the gondola actually have a negative impact on travel?</p> <p>Timing – there was no discussion of the potential timing of gondola implementation beyond a general goal of the 2050 plan. The problem is acute now and will only intensify over the next few years. The relative lengths of design/development/construction associated with the gondola vs the other options is important and should be part of an open and transparent process.</p> <p>Tourism – the concept of increased tourism value was discussed in the EIS; however, this was not identified in the Purpose and Need. The very thought that the gondola would be marketed as a tourist attraction seems contrary to the purpose of a gondola as it will put more pressure on its capacity, thereby leading to more traffic and congestion issues in the canyon. Additionally, this kind of marketing push flies in the face of the identified Purpose and Need in the EIS (which we think misses the mark as it does not consider the aforementioned need to do a capacity analysis).</p> <p>In addition to the above comments, WBA firmly believes than any transportation solutions being considered must take a much wider view than the current EIS. The fact that Big Cottonwood Canyon is not being considered is a mistake given that what happens in one canyon will have a direct impact on use in the other. It also seems that other key stakeholders, including UTA, have not been consulted as part of the EIS, which would seem to pose immediate issues and risks with implementing any solution.</p> <p>Wasatch Backcountry Alliance has formally been a part of the Mountain Accord and Central Wasatch Commission since the beginning of the former's process, and its board and members have been engaged in the community for decades prior to that. We understand the acute need and challenges associated with this process, and hope that our comments will be taken into due consideration to best help craft and create a solution that fits the current and future needs of the Salt Lake Valley residents and those people visiting the area who wish to explore and enjoy the beauty and majesty of the Central Wasatch.</p>

6459	<p>Little Cottonwood Canyon Comment - Please use this version. Thanks.</p>	Dave Brough	Email
6460	<p>I support the addition of more buses to Little Cottonwood Canyon. This would reduce carbon emissions and smog related to vehicle traffic, especially during winter months, and avoid the environmental and aesthetic consequences of putting in a gondola. Additionally, traffic, especially during heavy traffic periods like powder days during the winter, can be both harmful to the visitor experience in the canyon, the environmental stability of the canyon, and the ability of the area to attract tourists and the important revenue stream that comes with them.</p>	Gabriel Ransom	
6461	<p>Dear UDOT and Little Cottonwood Canyon EIS,</p> <p>My name is Paul, I'm a Utah native and resident of Salt Lake City. I'm a frequent visitor of both Big and Little Cottonwood Canyon, especially in winter, as I'm an avid backcountry skier. Although a reduction in traffic is my main concern, I am also concerned about access to various trailheads used by the backcountry ski community. This is why I strongly support the enhanced bus system with NO widening of SR210. This is both the least expensive option, and most likely to reduce traffic. Because these projects will be paid for with tax dollars, yet primarily benefit the private corporations of Alta ski area and Snowbird, taxpayer cost is an especially important issue. I am also a father who teaching his kids to ski, so I have long term interests in keeping the ski-experience of the Wasatch intact. I strongly disagree with the gondola proposal because it is the most expensive option, it is impractical consider one must bus to the gondola loading station, and Gondola Works is a for profit coalition making the whole proposal pretty dubious.</p> <p>Thank you Paul Nicholson</p>	Paul Nicholson	Website
6462	<p>I am in favor of the "enhanced bussing only" option. It is important that we preserve the natural beauty of our canyon as much as we can!</p>	Lucas Butterfield	Website
6463	<p>More roads mean we need more parking up the canyon which means more development. The canyons are suppose to be our refuge not another city fun park. We are simply growing to big. At some point we will have to limit folks into the canyons just like we do in restaurants. We should focus on more trails to get folks dispersed into the back country. Then provide bussing to get them there.</p>	Rebecca Kohler	Website
6464	<p>I feel that dispersed recreation is going to be inherently impacted by any of these three proposed solutions. I know from experiencing it for myself and meeting the people drawn to LCC and BCC for the recreation that people come from all over the world for the climbing, hiking, and backcountry skiing. I ask then that we reconsider alternative options. Why not look at increasing incentive and accessibility for public transportation options that are already in place.</p>	Sam Untersee	Website
6465	<p>I support the Enhanced Bus Alternative without road widening because I believe it is the most beneficial way to improve transport through the canyon, while causing the least amount of damage to the canyon itself, as well as the surrounding nature. Widening roads has long term effects with as destruction of habitats and similar. Additionally, many climbing areas that are well loved will be destroyed as a result of widening the road. As a par taker in such activities, I believe that it is crucial to preserve the landscape that provides opportunities for outdoor recreation, such as these climbing spots.</p>	Aspen Dalby	Website
6466	<p>My name is Synneva Hagen-Lillevik and I support the enhanced bus service without road widening option. The reason for this is that I am a backcountry skier and this option allows the best access to various trailheads. Additionally I think the gondola proposal seems expensive and not that effective. I don't think people will use it, and if you can drive up there anyways, no one will want to stand in line. It seems like putting the resources towards something more effective would be better such as a bus system. Thank you for your consideration.</p> <p>The latest version of the contrived mountain "accord" at least eliminates the train alternative, I suppose that's some progress.</p>	Synneva Hagen-Lillevik	Website
6467	<p>Big expensive projects to benefit private companies for the limited number of skiers in the community together with the severe environmental impact of carving into the mountains and foothills gondola eyesores in constant vision and their footings also cut into the landscape is not a good idea. Only really benefits skiers. What about hikers and other canyon users? They'll still drive.</p> <p>I'm for expanding bus service as the need develops. With parking and bus hubs in existing commercial areas. Purchase the shopko and turn it into a parking and bus hub rather than carving into the mountains with a 2,500 garage which will negatively impact the landscapes and neighborhoods.</p> <p>Finally, all of this for the 20 or so days during the winter when there are pow days on the weekends and avalanche control is necessary. Skiers get it and deal with it and so do the neighborhoods. You are overhyping the problem to get your grand project. I do not like how you've pitched this and put bias into the process and analysis.</p>	Darryl Neider	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	Hello		
6468	As an avid skier and environmentalist there are many factors at play with this issue. However, when we boil it down, the true value of the wasatch is its rugged natural beauty, which cannot be re-created, and thus it must be preserved. This includes ecosystem services including but definitely not limited to drinking water. Debitlating congestion occurs so infrequently that major changes that further developmental impact in little cottonwood canyon are not justifiable. Minimizing issues caused by traffic congestion requires a holistic approach to streamlining public transportation from the heart of the salt lake valley up to ski resorts. Enhanced bus service, paired with upgrades to transit options to reach transportation hubs at the base of the canyon is crucial. Widening roads in the canyon or adding gondolas are expensive options with little long term economic gain in proportion to environmental degradation. Enhanced bus service, with higher costs of operations, on the other hand, mean jobs have been created. This is another example of how expanded bus service can benefit the greater salt lake valley. UTA - for a problem that affects only those few of us who can afford it, please choose an equitable solution that benefits our greater community more than the vested interests up above the smog.	William Chandler	Website
	Thank you		
6469	I am commenting in support of a serious interim plan while better solutions are investigated. As currently designed, none of these plans are will fully address the problem at hand. The gondola as proposed will not carry nearly enough people, I have heard no mention of pricing ideas, and I am concerned about the ability of transportation from only 2 transportation hubs to the base of the gondola to go smoothly and quickly enough to incentivize ridership. I would like to see this study go back to basics and come up with some solutions that will actually solve the problem. Enhanced busses and the gondola alike are useless without significant increases in parking at all of the park and rides near the base of the canyon. The gondola needs to either run with enough hours to service employees and canyon residents or there needs to be a complimentary plan to help serve the needs of those members of the community. Will it run in the summer as well to decrease traffic on the road and make it safer for cyclists? How about stops at a few major trailheads for skiing and hiking (perhaps the angle station as it is currently designed). Is that a possibility with the type of gondola considered? On top of that, the gondola needs to promise to offer a significant decrease in both time spent traveling and money spent doing so in order for it to be helpful. Why is there no concurrent plan to institute tolling it both canyons that is scaled by the number of occupants (free for 3 or 4+)? Will the gondola be free for pass holders as it is currently for the bus? These plans leave me with more questions than answers and do not address all of the goals of the project. I would love to be in favor of a big fix like the gondola, but I just don't think the solutions we have in front of us are sufficient and complete. LCC needs a serious plan for the interim before we can proceed to futuristic goal projects unless a gondola can be built overnight. This means enhanced busses, much much more parking at park and rides, better designed busses to accommodate people with all their ski gear for extended periods of time, as well as tolling until more research can be done. Thank you for the work that has already been done on this topic and I am looking forward to progress in the future	Heather Witzel Lakin	Website
6470	I support the gondola & LaCaille base station plan	Mary Ellen Segodnia	Website
6471	I strongly support the gondola option and suggest that the option be modified to reach the Caille lands with parking garage to alleviate the bus segments.	Paul Matthews	Email
	Paul Mathews		
	I have been riding the UTA bus to/from Alta for the past 8 ski seasons. I have also bicycled on the canyon road – thousands of times – over the past 35+ years. After reviewing the alternatives, I favor the enhanced bus service WITH road widening. I base this preference primarily on 3 factors: 1) The gondola solution only delivers passengers to/from the ski resorts, and ignores dispersed users. In addition, the gondola will require passengers to transfer too many times: car to bus, bus to gondola, then whatever is necessary at the resorts. If hauling a full complement of gear (think families), this will be a mess. I base this on how poorly most people/families deal with getting their gear on/off the UTA buses now (watch your kneecaps!). It also seems to me that the gondola service is not scalable, i.e., you can't add more cabins if needed, and you can't make the cable go faster. And what about the majority of the 365-day year when the gondola will see very little or zero use? This seems like a waste. 2) Skier traffic is "bursty" in nature. This is pretty obvious. There are large numbers of people trying to get up the canyon in the mornings, especially on powder days and on weekends, and likewise (although somewhat more dispersed in time) coming down at the end of the day. It doesn't make sense to me that a mass transit solution would not inherently try to match this bursty pattern. The gondola does not do it. Buses can, although the practicalities of scheduling buses and drivers on a dynamic basis is a challenge. Weather forecasts (good for a few days in advance) and the calendar (upcoming weekends, holidays) could be used to schedule the extra service. The present static bus schedule provides adequate service on the vast majority of days, but is hopelessly out of step with demand on powder days and many weekends. My best friend on those days is the UTA Transit Tracker app. I can see how bottled-up the buses are, below and in the canyon, and know whether or not it is worth walking down to the bus stop. If all the buses are tied up on the road, I sit back, drink coffee, read the newspaper and wait for the mess to clear. 3) The road is not going away, no matter what. I have been skiing and bicycling in the canyon for 38 years. Other than slight reconfigurations of the road – adding some passing lanes, making the shoulder wider on the uphill side to accommodate bikes in the warm months (that would be me, 200 days/year) and such, I've not seen much change in the road over the years. What I have seen, though, is an enormous increase in traffic on the road. This is more than just ski traffic. Summers have become increasingly dangerous to bicyclists, especially over the past 10-15 years. Pedestrians are unpredictable and clueless to 40+ mph traffic at Lisa Falls; cars are parked along the road and present hazards near the Gate Buttress, Lisa Falls, White Pine, Snowbird, and a few other places. With this already happening, and the local population trending upward, I believe that the road widening could provide a safer experience for bicyclists in the summer along with the means to give buses an advantage in the winter.		
6472	I will honestly be shocked to see any of the alternatives implemented in my lifetime (I am 66 now). We have been studying the canyon transportation issue and writing reports for decades without anything of significance to show for it thus far.	Robert Wright	Website
6473	I am worried that if a Gondola is implemented in little cottonwood canyon it will create a "mountain town attraction" and exponentially increase the amount of visitors LCC receives. I also am worried about the structural impact a Gondola would have on the flora and fauna throughout little cottonwood canyon as well as the impact it would have on many of the climbing crags located near the mouth of the canyon and along the canyon road. I believe a better busing system is the best option.	Baylee Vogler	Website
6474	These options fund private businesses without helping the public recreate. Public funding should include more parking lots for other activities, trail head improvements, and more trails through the canyon. Making it easier for skiers to get to a private mtn should be funded by snowbird and alta.	Andy Librande	Website
	Ladies and Gentlemen:		
6475	Please find attached my comment letter on the Little Cottonwood Canyon Environmental Impact Statement (EIS) dated June 8, 2020. I would be happy to discuss these comments with you if they are of interest. Sincerely, Frode Jensen	Frode Jensen	Email
	I live right on Wasatch boulevard on 8852 Alpen Way. I use the Little cottonwood road every weekend in the winter and several times a month the rest of the year.		
	Road widening on Lower part of Wasatch Blvd: I think the Imbalanced Lane Alternative would work; the extra down lanes really are not needed that high up for the amount of traffic after skiing. This proposal would help with some of the bottle necks that occur doing regular evening commuting that occurs between the fires station light and Bengal Blvd.		
	Peak Period Shoulder Lane Alternative: The shoulder lane may help with bus being able to move when the traffic is slow, however I feel that people in cars would just take up the lanes anyway despite the rules/laws. What really slows the traffic down are the har 90 degree turns with a hill. People slow down about 10-15 mph below the average speed for the condition which causes a re-spacing issue and traffic. I would like to see road straightening with avalanche sheds for these sections. By the time you get to a mile before snowbird the traffic always is moving fast. Therefore the real bottle necks are the light turns: so just straighten them out a lot. Second, we need passing lanes. People sometimes drive 10-20 mph below the speed limit or safe speeds for the conditions. Although these people should take the bus or rent/buy a car with snow tires, that is unlikely. So, we still need some passing lanes if the shoulder lane alternative goes into effect, as people will likely use the shoulder to pass or be past. Does not need to be the whole way up or down, likely just a few passing sections are needed.		
	Snow sheds: I always thought in principle these would be good for this particular canyon. However, they need to be strong enough to hold snow as the road is where the snow stops, hence the digging out every time, and long closures. I'm not sure these structures are that or can be that strong. Maybe, moving the road up the hillside as part of the road straightening would do the trick. As one of the bottle neck turns is right before a proposed snow shed.		
	Gondola: As the gondola proposal stans in this proposal it makes zero sense. I would not ride it even though I live close, except for a powder day, then maybe. First the 1,000 person an hour capacity is very low and would cause the development of long lines. Likely, need it to be 5,000 people per hour. It only takes me about 15 minutes to drive up the canyon on a clear day, so I get an extra 2-3 runs for my time or extra work done, so a 60 minute transit time makes no sense and therefore I and many others would not use it. Second, I can't park at the gondola, if I'm already on a bus I would rather just stay on the bus and get ride to the mountain at that point. However, the La Caille Base Station option makes more sense, as it has parking and a larger person per hour capacity. It is also slightly lower in the Canyon and would allow for easier driving access from Wasatch Blvd and Little Cottonwood Canyon Blvd. It would also be in walking distance from many of the local residence, which would further reduce car traffic dramatically and also take advantage of lots of street parking, which is also under utilized. Additionally, re-zoning could open up places for hotels that are in walking distance of the gondola, which could increase revenue for the town. Also, there would be much less traffic as people would just drive a park, and don't have to drive through a bottle neck road or wait for avalanche gates to open. I do like the idea of a gondola and have proposed it in conversation often. Many valleys in the Alps use them with great success and Sunshine Village in Canada has one that also works wonderfully. If the gondola is done wrong, well... you (all in the planning team) will likely lose your job, people will be incredibly upset in Utah. I say this not to be mean, rude or angry, but just realistic. Simply, it has to be done absolutely perfectly for it to be a success. I do think there are outlines of ideas and current technology available to have it done perfectly. I think the 3S-TFD or Funtel Doppelmayr is the technology to pull it off, but you will need to push that technology both are designed for this application and I have ridden both. The 3S is faster and higher capacity, the Funtel is slightly slower and less capacity but has a wide gage set of cables so it is very stable in high winds, for a low canyon application the 3S is likely the best option. The LLC Gondola must be is fast, high capacity and have lots of parking, with easy driving access, those are the corner stones that cannot be compromised on.		
6476	Boring Tunnel Option: This should be explored, it has promise in principle and has many benefits in how it could preserve the canyons and water shed. Enhanced Busing Option: This seems like first and best option, although it would not solve the powder day problems (10 days a year). Ski trail down to the gondola: One of the easiest ways to remove cars in the winter, is just to have a small ski down road that is groomed several nights a week. This would be hugely popular with both resort and back country skiers and would also be a great bike ride in the summer. I have skied these in Europe/Canada, and they work great. Family will still drive: All families with small kids will likely still drive, the thought of an infant or toddler on a long gondola ride and the gear you need to have a fun day in the mountains with a toddler is hard to carry. Although a small group of canyon users, families with kids, 8 and under, will likely prefer driving no matter the options.	Jay Hyden	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6477	<p>Why are trains not being considered as an option? It would be ideal to catch a train from the airport and take it directly to the ski resort. As an avid skier, one of the biggest motivating factors to driving up the canyon is to avoid taking a crowded bus home at the end of the day. Trains offer more room, could take more passengers per trip, and would avoid the overcrowding issue that busses bring. A solution involving a train also would be a long term solution instead of a bandaia fix that would be an ideal from the get go.</p> <p>Another benefit of installing a train system is the marketability of it. We would not only have "the best snow on earth", we would also have the most accessible snow on earth. Quite often when I am comparing places to go on vacation i will pick a place where it is convenient to move around. Not having to deal with a rental car would be a huge selling point to people coming in from out of state. I would find it very appealing to be able to fly in, and seamlessly travel from the airport to the ski resorts. Having to take a transfer and walk a few blocks, or even across a busy street to catch a different mode of transpiration in a area in which i am unfamiliar is not ideal. having to do so increases the risk that i miss my buss, and become frustrated. I'm on vacation, and I don't want to deal with frustrating situations. When I'm on vacation I want everything to go as seamlessly, and stress free as possible. A buss does not solve that need, where as a train offers the seamless convenience that would make it worth using.</p> <p>Lets build our infrastructure in ways that immediately benefit the community, and allow us to better serve our growing needs as Utah grows. We already have busses as an option to get up the canyons. As evident by the overcrowded parking lots, not enough people want to take a bus. Lets invest in a system that gets the job done the right way.</p>	bruce johnson	Website
6478	<p>I support enhanced bus service and not additional lanes or gondola.</p> <p>Comments on the Little Cottonwood Canyon EIS</p> <p>The Little Cottonwood Canyon EIS sadly seems to be all about moving people to the ski resorts in winter. While this is of course an important consideration, there are many other canyon users that are considered after skiers in cars or buses or gondolas.</p> <p>From the perspective of a cyclist, we like the alternative of adding a lane to the Little Cottonwood road for buses. But, there are many challenges. Cyclists do ride the canyon road in the winter and spring (not typically on snowy days), and to close the option to cycle is not good. But we would rather you kept the road the same width and just worked a bit to add shoulder space for uphill cyclists.</p> <p>From the perspective of an environmentalist, limiting traffic and not expanding the road is important too. Sadly, UDOT has used an outdated Level of Service concept to evaluate alternatives rather than vehicle miles traveled.</p> <p>As for the Gondola alternative, please don't do this. This is nothing more than a ski area giveaway. It would be a huge eyesore in the canyon, and it has no place in one of the most beautiful places in the west. I'm puzzled as to why this was given serious consideration.</p> <p>In the push to remove road side parking, while there are certainly some good consequences for this, please don't allow this to become a windfall for the ski areas to charge for parking. Many people come up in the winter and spring to backcountry ski, hike, or just play in the snow that do not need to be subjected to ski area lots.</p> <p>As for the summer, unless there is a solid public (not private) transit alternative, that is reasonably priced, runs early and late, and often, removing parking along the road restricts hikers and bikers. To reduce conflict with cyclists and motorists, please consider reducing the speed limit (it used to be 30 mph long ago), and at least widening the road enough for bike lanes going up. Or, dedicate a lane of the 3 lane section from Tanner's Flat to Entry 1 as bikes only in the summer.</p>	Hannah Pugh	Website
6479	<p>Snow sheds: We don't need these. If the road closes a couple of days a year for a few hours, that's ok. Please don't add eyesores to the canyon.</p> <p>Wasatch Blvd: Regarding Wasatch Blvd, expanding the road to 5 lanes is a poor alternative and doesn't mesh with Cottonwood Heights community desires. It will become an even worse barrier between east and west.</p> <p>As a cyclist, I fear that this will turn Wasatch into an incredibly unsafe roadway, more unsafe than it already is. There are no plans as far as I can tell to have narrower travel lanes and slower speeds. This is imperative, no matter which plan is chose.</p> <p>Why doesn't UDOT consider reducing VMT here, rather than chasing an outdated LOS standard. If you expand the road, there will just be more traffic, and you will waste taxpayer money anyway.</p> <p>Wasatch should have a design speed of 35 mph, not 50 for a safer Cottonwood Heights.</p> <p>Overall: Overall, the alternatives in this EIS are awful. Please go back to the drawing board. Remove the gondola, and put more emphasis on transit. Make sure to include other canyon users in all seasons, don't just focus on skiers in winter.</p> <p>Sincerely, Dave Iltis Salt Lake City, UT</p>	Dave Iltis	Website
6480	I support enhanced bus service and not additional lanes or gondola.	Samuel Pugh	Website
6481	I would hope the gondola would have the least impact on the environment in the long run, and hopefully discourage car use more than busses would. Also help reduce skiers stuck in canyon during avalanche road closure	Greg Barltrop	Website
6482	enhanced bus service in a separate lane	Nicole Bennett	Website
6483	I would like to see expanded bus service in a separate lane which could be used by cyclist in the summer. I believe it's imperative to make driving cars more of a hassle than the busses to encourage transit use	Lindsay Keegan	Website
6484	Please consider that trains would be a viable option to serve the cottonwoods.	Julianna Braley	Website
6485	Please do not expand the road as this is already impacted. Destructing land is not an option - have more bus options period. Do not expand the road, damaging the land and also taking away some boulders that climbers use	Michaela Cloud	Website
6486	<p>Dear Mr. Braceras -</p> <p>Thank you for the opportunity for me to provide input on the June 8, 2020, UDOT Draft Alternatives Development and Screening Report. As you know, I have been working closely with the Granite Community Council Transportation Committee to provide input into the UDOT LCC EIS process along with the other participating and cooperating agencies. I have read the above report that details three alternatives selected by UDOT to move forward for full analysis in the Draft EIS. As you know, NEPA requires that the lead agency analyze all reasonable alternatives that meet the stated purpose and need of the project along with "No Action". Because of this requirement, I believe the June 8, 2020 Draft Alternatives Development and Screening Report to be fundamentally deficient as follows:</p> <p>No Action - The document does not identify the alternative of No Action (or current management) which is required by NEPA. The public must know what road and transit improvements would still likely occur if the EIS did not occur. UDOT has wide latitude to construct small additions under the umbrella of maintenance as a categorical exclusion or FONSI (Finding Of No Significant Impact). UDOT has already slightly extended (4-6') the road surface along the entire length of SR-210. It has also paved certain pull-outs. Other improvements would likely occur without this EIS. Furthermore, bus service has been enhanced in recent years; so it appears that no EIS is necessary for increased bus service. It could be enhanced further without major parking lot construction by utilizing other transit hubs in the Salt Lake valley.</p> <p>Other Reasonable alternatives – The document fails to identify all reasonable alternatives that meet the purpose and need, as required by NEPA. The Purpose and Need for this EIS was to 1) Improve reliability and safety in 2050, and 2) Improve mobility in 2050. UDOT has suggested three alternatives that fit this bill. As we know, there are several other reasonable alternatives presently not identified by UDOT, that would fit under these requirements.</p> <p>Surface gondola from LaCaille Center and Villages – This proposal from CW Management Corp suggests that the valley terminus of the surface gondola proposed by UDOT occurs at the LaCaille Center and Villages. Parking would be constructed at this location to provide for skier access. Along with parking provided at LaCaille, additional parking would be constructed at the gravel pit and possibly at 92nd south/Highland. The proposal is for UDOT to secure public funds to construct the gondola and parking lots. Enhanced bus service would provide access to the gondola terminal from the remote parking facilities. This proposal would keep 2,500 cars out of Little Cottonwood Canyon but congestion would still occur at the base along Wasatch Blvd. This gondola proposal would exclusively serve two ski resorts, Snowbird and Alta. The major benefit of this proposal is that it would eliminate the need to make major improvements to SR-210 that would necessitate blasting and building the third lane as proposed by WFRC (Wasatch Front Regional Council) in its RTP (Regional Transportation Plan).</p> <p>Surface gondola from Summit County – This proposal would construct a gondola transportation system traversing south from Summit County and over the mountains connecting six of the ski resorts at the head of the Cottonwoods. It would stop at Snowbird or it could extend down canyon only to the canyon base. A high capacity parking garage (2,500) similar to the one currently proposed at the gravel pit at the mouth of Big Cottonwood Canyon, would be built near Kimball Junction (just off I-80) perhaps located near Olympic Park. Skiers near downtown and around Salt Lake City would be encouraged to drive or take an express bus east on I-80 to park and access the gondola and ride that to the Cottonwood Canyon's resorts. This would potentially eliminate entirely 2,500+ cars from the mouth of Big and Little Cottonwood Canyons. In addition, this gondola would eliminate the cars driven by skiers to the Cottonwood Canyon resorts from Park City. This proposal was advanced by Salt Lake County in its Mountain Transportation Study back in November 2012. It was also a citizen proposal brought forward as early as 2012. It fulfills the direction of the Utah State Legislature through SCR-10. It also provides critical and lifesaving secondary emergency egress from both Cottonwood canyons.</p> <p>Train system from Summit County - This proposal would construct a tunnel through the mountains between Summit County and Big and Little Cottonwood canyons. This is the Mountain Accord "Proposed Central Wasatch Blueprint. It was endorsed by 20+ Mountain Accord stakeholders, including Salt Lake County, back in 2015. It too would connect ski resorts and might meet the direction of SCR-10. If a high capacity parking facility were provided for the train as is suggested for the surface gondola, it could take a substantial number of cars off the highway at the base of the Cottonwood canyons.</p> <p>Parsons Brinkerhoff proposal – This proposal was made via the transportation study financed by Mountain Accord. This proposal would construct the surface gondola from Summit County connecting the ski resorts from the top of the Cottonwoods. It would not construct high capacity parking in Summit County to attract skiers from Salt Lake City who want to access the Cottonwoods. Instead, this proposal advocates enhanced bus service up existing Cottonwood canyon roads.</p> <p>Incomplete Purpose and Need and screening criteria – It appears the Purpose and Need and screening criteria used by UDOT to screen potential alternatives were never finalized before being used to assess potential alternatives. Without being finalized, the public has no way of knowing whether their comments were never read or were considered and rejected, or were used without being specified in the official document. It is clear that criteria were used in the alternatives screening, such as the 30% rule, that is not currently found in the most recently posted draft Purpose and Need and alternative screening criteria document. UDOT pledged early on to be completely transparent while leading this NEPA effort. One can easily see that developing screening criteria hidden from the public process is not fulfilling that pledge and makes the final EIS susceptible to challenge and further delay.</p> <p>Again, I appreciate the opportunity to provide feedback to UDOT on its June 8, 2020 Draft Alternatives Development and Screening Report for this critical phase of LCC EIS development. I believe the deficiencies presented above could potentially derail the UDOT EIS down the line if they are not adequately addressed now. I believe it is important for UDOT to produce a second draft of the alternatives report for public review to address these clear deficiencies. I look forward to working with UDOT and Salt Lake County and the other cooperating and participating agencies in this regard.</p> <p>Sincerely, Norm Henderson</p>	Norm Henderson	Email

6487	Don't expand the road and impact the surrounding area. Please. The roads are not that busy as you believe they are and expanding the roads will only create more havoc on the delicate ecosystem	Marco Maramaon Cattani	Website
6488	I strongly back continued exploration of the gondola option. While the tower construction will impact the environment of the canyon floor in the short term, the benefits it will have in the long term of both offsetting vehicle emissions and making it easier for wildlife to cross the road will make it worth it. I have some reservations about what kind of visual impact the gondola would have as well, but I would want to see some renderings of the system before casting judgment. However, any of the three options is ultimately better than the status quo of over-reliance on private vehicles. I trust the subject matter experts to choose the option that is most convenient to skiers while also preserving and protecting as much of the fragile canyon environment as possible for future generations.	Andrew KatsorahirikK	Website
6489	I am in favor of the first option, an expanded bus system. I do not think substantial widening to the road has to take place along either Wasatch or LCC. Traffic is worst on the weekends between December-March, just a dozen or so days per year. It makes sense to expand bus service during these weekends and to perhaps even impose a winter weekend toll for private cars. That said, if option 1 is not possible, I would definitely favor option 3 (gondola) over option 2. Thank you.	Rachel Anders	Website
6490	<p>Thanks for your work facilitating public involvement and processing the many comments as they pertain to the betterment of the Draft LCC EIS Alternatives. As a climber, skier and canyon advocate, I appreciate the opportunity.</p> <p>After viewing preliminary engineering added to the public domain during the comment period, I am concerned that potential impacts to Section 4(f) properties in the lower canyon have not been appropriately represented during the screening process. Although, it is difficult to confirm as potentially impacted, 4(f) properties have not been specified or described beyond simple totals. Regardless of classification, lower LCC has a much-loved wealth of recreation resources to the north side of the highway that would be significantly changed and impacted by these alternatives.</p> <p>The Gate Buttress Property (Section 4(f)) is leased by the Salt Lake Climbers Alliance (SLCA) from the LDS Church. The associated parking lot and climbing locations has been frequented by rock climbers for over 50 years. Recently, significant funding has been invested formalizing the trail network from the gravel parking area to centralize access and reduce roadside parking. Parts of the down canyon connector trail and the popular 5 Mile bouldering area would be destroyed based on the PPSL alternative.</p> <p>Construction, maintenance, and rescue access to the gondola tower location just west of the parking lot would impact existing trails not to mention the visual resource impacts from the tower and cabins. Climbing is growing in popularity and the Gate Buttress parking lot is frequented by many other disperse recreation users. Without the roadside overflow parking, this lot should be optimized for capacity and connected by trail to the Grit Mill for overflow. It could be complimented by a small pullout on the opposite (south side) of the highway with limited parking and space for a transit/shuttle stop and drop offs. All formalized trailhead parking needs appropriate pedestrian crossings and space for stops that accommodate transit, shuttles, or ride-share/drop-offs.</p> <p>The Alpenbock Loop (Section 4(f)) is a new trail loop from either end of the LCC Park and Ride with a connector to the future Grit Mill parking and trailhead. This is a new Forest Service trail network, built and funded through a cooperative effort between the FS, Salt Lake County, State of Utah, the Access Fund, and the SLCA. Many popular climbing resources are accessed via the trail network and the property is part of the historic, Temple Quarry cultural site. The Secret Garden and Cabbage Patch bouldering areas would be partially destroyed, based on PPSL cut lines. In each area, the boulders closest to the existing highway exhibit the characteristic quarry marks from splitting the rock to build the Salt Lake Temple.</p> <p>Currently a gondola tower is sited directly over a section of the loop trail which would be further impacted from construction, maintenance, and rescue access. With the gondola base station currently planned for the middle of the Park and Ride, the future condition of this lot as needs to be represented as a trailhead, and variations in parking capacity accounted for, in each alternative.</p> <p>Additionally, the Park and Ride is the only lot plowed lot in the lower canyon below Lisa Falls. Disperse recreation occurs all year long. This year, fine spring conditions in the lower canyon clashed with low elevation snow pack, clogging the Gate Buttress and adjacent roadside parking. A limited and dangerous situation ensued with high speed ski traffic, overflowing parking, pedestrians and cyclists. The alternatives could use some explanation of how existing and future parking will be managed as it factors into to canyon mobility, reliability, safety, and parking capacity.</p> <p>Sincerely, Jonathan Knight</p>	Jonathan Knight	Website
6491	<p>No, to all 3 of Udor's ideas. Cottonwood Heights portion of Wasatch boulevard should not be considered as a high speed freeway. It needs to be treated as a street. All of the residents who live between the mouth of Big and Little Cottonwood Canyons who use Wasatch as access to their neighborhoods. DO NOT WANT A FREEWAY!! The current speed limit is not enforced nor followed. Everyday people past me going 65 -70 m.p.h. on Wasatch. This situation is 2 very clear issues.</p> <ol style="list-style-type: none"> 1. Skier traffic going to the canyons. And the road conditions due to weather. 2. Every day commuter traffic passing through to Sandy and Draper. <p>2 issues that share the same part of Wasatch that effect many Cottonwood Heights residents. I have lived in the King's Hill area for 38 yrs. I worked in Little Cottonwood Canyon for 36 yrs. I have seen it all. All the traffic, bad weather, avalanches, road closures and commuter traffic. As for the resorts caring about the residents dealing/coping with the skier traffic...They do not care. Nor have they be willing to think about they impact on the residents. As long as they patrons get to their lifts.</p> <p>I have attended national/ world sports events . Our situation with skier traffic is no different then many of the events that I have attended. Nor is it any different then what Zion's or Yosemite National Parks deal with in traffic. We do not need to reinvent the wheel! Just as the parks... The resorts can only accommodate a certain number of people every day. Just like a major event the majority of the people are all trying to get to one particular spot by a given time. All the people will wind up at the same spot however they come from many directions. To allow all these people to slam together trying to get to one particular spot always causes chaos. Very expensive very specific ski busses were designed and built to run in Big and Little cottonwood Canyon. And yet the most of the miles on those busses are accumulated because they are run all the way back down out of the canyons and back down to the hubs. Specific ski busses should stay in the canyons going up-and-down doing the work that they were built to do. The UTA ski bus safely record in the canyons is remarkable. It is much safer to be on a bus then in a private car. Run the busses every 10 minutes up the Canyon all day long and the same coming down. If you are going to Zion's or Yosemite, you ride the bus. There needs to be many centralized hubs where skiers can get out of their cars and get on a bus to take you to the mouth of the Canyon. These busses need to be strictly for ski traffic and goes quickly to the canyons. All downtown hotel guests along with residents of The Valley need to be able to have access to easy hubs that will allow them to board busses that take them quickly to the mouth of the canyons to board a ski bus. Do not allow the traffic to come to the canyons. You reduce the tremendous amount of traffic on all the arteries leading to the canyons. You would greatly reduce the amount of traffic on Wasatch boulevard during ski season. This is not rocket science. If you go to the US Open for example you don't drive any closer than 20 miles to the site. They have a developed a beautiful system of buses. All of the residents that live around the golf course are not stuck in their driveways ,stuck in traffic, are not allowed to go home due to traffic. The real issue of skier traffic is to get people out of their private cars and get them on mass transportation a long ways away from the canyons. This Valley is covered in asphalt parking lots that are underutilized. The tax revenue that is created from the resorts is a benefit to this entire state. Currently if a visitor is to try to go up either canyon by mass transportation it can take more than 2 and a 1/2 hours, one way. Skiers will not put up with this. If ski busses are run every 10 minutes and there are no other cars on the canyon road, buses can move efficiently. Usually when the avalanche danger is high at the resorts it is also high on the road. Mother nature at times will always cause a problem with avalanches. However the 8 mile snake as it is often referred to , due to backup of traffic in the canyons will not happen if people are on busses. The continual assault on the environment from all those cars will also stop.</p> <p>For the 2 and a 1/2 mile stretch of Wasatch boulevard that is caught in between Should not become a highway. For daily commuter traffic why is Highland drive not being finished? Why are we as Cottonwood Heights residents having to deal with the commuter traffic coming from Sandy and Draper? Why can this traffic not be also spread among the other arteries? Making this stretch of Wasatch 7 lanes IS NOT THE ANSWER! We will not be able to cross Wasatch. We will have neighbors killed on"</p> <p>Wasatch trying to get in-and-out of the neighborhoods. I don't believe that Udor understands the multiple use of our neighbors hoods and Wasatch. On any weekend day, The number of joggers and bicyclists using Wasatch is enormous. 7 lanes of traffic will stop people from enjoying the area. Speed kills...people, animals, neighborhoods, environment. The lack of planning for the south end of this valley 30 yrs.ago is being dumped on us. This is not good policy! Every since Trax's came on line...we lost UTA bus service. There is no way for residents who live above Highland Drive to use UTA . We had great service before Trax's. We rode to downtown, to the University of Utah, Sandy. To events, to school, shopping. UTA must reestablish bus lines for the east side. Service that allows for travel in all directions. Where are the buses?? We have the roads, the old bus stops and people willing to ride. Bring the buses back. Again, get people out of their cars. Do not pave more, widen more, tear down my neighbor's homes. Develop bus service for Sandy , Draper and Cottonwood Heights along the Wasatch corridor. First! Spread the traffic out...Finish Highland Drive.</p>	Russ Harmer	Website
6492	The gondola option does not appear to take into account the time delay from waiting in lines at the transit hub and the gondola base station. Also, a fire in the canyon that shuts down the highway would also shut down the gondola, so a route over the backside to the Kimball Junction area would provide better emergency egress. Putting the base station near Kimball Junction would provide ample room for hotels, parking, etc. to turn it into a hub for skiing the Cottonwood Canyons, and much skier traffic could be routed from Salt Lake to Kimball Junction via I-80. Finally, please consider a Loop tunnel system from Elon Musk's Boring Company, connecting Kimball Junction to the Cottonwood Canyons and transporting people through the mountain at 160 mph. This would make it much faster on busy days to reach Alta via I-80 than it would be to drive up Little Cottonwood.	Nelson Clayton	Website
6493	As an avid outdoors-enthusiast and as someone who lives directly at the base of Little Cottonwood Canyon, I urge the Utah Department of Transportation to support the enhanced bussing only option (rather than creating additional lanes or building a gondola). Not only will the other two options carve into the beautiful landscape of our canyon, but they will damage the natural habitat and our watershed (which I and countless others rely on). As a rock climber, I also oppose these two options. Many popular climbing/bouldering spots are right off the shoulder of the road. Carving an extra lane reduces accessibility to these areas and funnels climbers into a few specific spots, which both degrades climbers' experiences and overruns the area. Additionally, the gondola only serves the large ski resorts--the only proposed stops are at Alta and Snowbird--and yet all taxpayers are asked to contribute to its construction. This flaw with the gondola is inescapable, as adding other stops is both impractical and expensive and also would further damage the canyon. When thinking about how to solve the congestion issue, we need to think about preserving our amazing canyon for future generations rather than maximizing profit for ski resorts today. I advocate for enhanced bussing and tolls on days where there is likely to be significant traffic congestion. While some argue that tolls are inequitable, this specific combination of more bussing and tolls should actually increase accessibility. Increased bussing helps people get up the canyon even if they don't have a car (especially if mobility hubs were served by better bus access throughout the valley). Additionally, tolls incentivize public transportation (which is good for the climate and our notorious air conditions). Skiing is also generally a fairly wealthy sport; Tolls on heavy ski-traffic days will therefore likely fall on wealthier people in any event. All of these reasons aside, doesn't it make more sense to first start with an option that doesn't create permanent damage? If we build a gondola or carve an extra lane, those changes to the canyon will remain forever. Even if we aren't sure enhanced bussing will be enough, we should try it first! I believe enhanced bussing will increase accessibility while preserving our beautiful canyon for generations to come, and I strongly support this option!	Emma Sun	Website
6494	Please go with the enhanced buses without widening the road at all. Doing this would put access to climbing areas within the canyon at stake. The other options seem like they only benefit Snowbird and Alta, and they don't take into account the other outdoor activities within Little Cottonwood Canyon.	Cole Schmidt	Website
6495	As a regular skier of LLC, my strong preference would be a gondola. Long term solution that works very well in many other countries.	Justine Macneil	Website
6496	I support enhanced buses to start, to be followed by roadway widening. Also change for parking for cars with less than 3 people. This would reduce the number of cars heading up the canyon.	Pamela Stegerwald	Website
6497	As an avid outdoors-enthusiast and as someone who lives directly at the base of Little Cottonwood Canyon, I urge the Utah Department of Transportation to support the enhanced bussing only option (rather than creating additional lanes or building a gondola). Not only will the other two options carve into the beautiful landscape of our canyon, but they will damage the natural habitat and our watershed (which I and countless others rely on). As a rock climber, I also oppose these two options. Many popular climbing/bouldering spots are right off the shoulder of the road. I believe enhanced bussing will increase accessibility while preserving our beautiful canyon for generations to come, and I strongly support this option!	Emma Sun	Website
6498	i would like to see increased funding for buses	Matt Bigelow	Website
6499	Option 1 for now. Train would be better. Everyone who drives should pay and buses should be free. Tram kills the most beautiful view of the canyon. Looking down the U shaped canyon is breathtaking. Trains are expensive But it's a long term play. Need more space add more cars, can run year round. Very little need to maintain roads in the winter. Trains can be shielded or underground from avalanche paths.	Dean Raynes	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
6500	<p>Hello,</p> <p>My comments today are regarding the Little Cottonwood Canyon EIS. After reviewing the alternatives for the canyon there is a good start to this plan, however, I see major concerns with each of the 3 alternatives.</p> <p>First, the Gondola is my biggest concern. In my opinion, the gondola would ruin the canyon landscape. Also it would not provide the vehicular relieve to the canyon. Based on the stations, the gondola is only catering the ski resorts, not users that want to access other areas of the canyon. Please don't build a gondola.</p> <p>Second, I support the alternatives of adding more buses to the canyons, however, snow sheds and widening the roads is not the answer. There are inherent risks involved with the mountains, adding snow sheds to potentially reduce road closures appears to only be accommodating the resorts and will ruin the canyon landscape. Widening the roads will have an environmental impact on the already stressed canyon and is simply encouraging more vehicle traffic. The focus should be reducing the amount of vehicles traveling up the canyon. Bus routes need to be considered from valley locations up to the canyons to reduce congestion and parking concerns at the base of the canyons. Resorts could help increase carpooling and reduce vehicular traffic by charging for parking and have tiered pricing based on vehicle occupants (i.e. follow Solitude's parking plan). The three alternatives cater to the resorts, but what are the resorts doing to provide a long-term solution to the congestion problem?</p> <p>Finally, the canyon enhancements should be focused on all users. Not a select group. The alternatives may provide temporary relieve, but fail to provide a long-term solution. Regionally connected and increased public transportation alternatives need to be explored to facilitate and encourage using public transportation that ultimately become a greater convenience than personal vehicles. Please don't build a gondola, widen the roads or build snow sheds.</p> <p>Thank you.</p>	Bentley Woolley	Website
6501	<p>The significant traffic problems at the mouth of Little Cottonwood canyon need to be addressed, but we should do so in a scalable, flexible, and reversible way that does the least harm to the sensitive canyon environment. While the traffic problems are significant, they occur on only a few days a year, so we shouldn't adopt a solution that is permanent and year-round, especially when the benefits are really only felt on a handful of days and primarily by skiers and the ski resorts. A gondola that serves the two ski resorts will do little, if anything, for summer recreation or for any kind of winter recreation that occurs outside resort limits. An additional lane is really only useful on those few very busy ski days. Additionally, road widening will cause significant environmental damage in the canyon and to the watershed, and will hurt access to smaller trailheads and climbing spots and funnel people into larger parking lots by the most popular trailheads. Those trailheads will suffer from that overuse.</p> <p>We should focus on enhanced bus service combined with significant tolls for private cars (without multiple passengers). This solution will allow us to manage the traffic problem without doing additional damage to the canyon. There is no reason to jump to a destructive, infrastructure-heavy solution without trying solutions that don't require significant building in the canyon, with the monetary and environmental costs that building would necessarily entail. We should adopt a "no regrets" strategy where we test different patterns of bus service and tolls for private vehicles before moving to any solution that requires additional built infrastructure.</p> <p>Adopting a "no regrets," first-do-no-harm solution is particularly important given that climate change may make ski resorts and skiing less and less viable over time. While we certainly hope that climate change doesn't have a significant effect on snowfall in Utah, there is good reason to think that it will. Building permanent infrastructure that damages the canyon and that is primarily designed to manage ski resort traffic is short-sighted given the risks that climate change poses to the viability of the ski industry over the next several decades and beyond. Losing the greatest snow on earth would be a terrible tragedy--and one that we shouldn't compound by additional damage to our canyons through unnecessary built infrastructure. We should choose a solution that helps solve our current problems without committing us to damaging infrastructure that may not be necessary in the future.</p> <p>Additionally, the point of this process is not to allow the ski resorts to get as many people into the canyon every day as they deem possible and preferable. Ski resort capacity is necessarily constrained, not just by space on the hills at the resort itself, but also by how many people can reasonably be moved up a narrow canyon on any given day. We shouldn't allow the resorts to insist that they be able to maximize the number of people on their hills when that will entail significant environmental damage. Moreover, whatever solution is chosen, should be funded--at least in part--by the ski resorts that will benefit the most from increased capacity to move skiers up the canyon. Moreover, detailed studies about the carrying capacity of the canyon--both for winter and summer recreation--should be conducted before we adopt solutions that increase the number of people who can be transported through the canyon. We shouldn't increase transportation capacity without considering how much use the canyon can sustainably support.</p> <p>Building infrastructure like a gondola or additional lane that damages the canyon today also creates significant issues of intergenerational equity. We need to preserve the canyon for future generations, rather than maximizing ski resort profits today.</p> <p>Moreover, if a gondola is built, the base station should not be right at the entrance to the canyon. Over time, there will be significant pressure to build large parking lots at that base station, even if the current plan is to funnel people through mobility hubs off-site.</p> <p>Thank you for your attention to these matters.</p>	Lisa Sun	Website

COMMENT NUMBER	COMMENT	FULLNAME	COMMENT SOURCE
	<p>Here are my comments on the Draft Alternatives Development and Screening Report of the Little Cottonwood Canyon EIS:</p> <p>Alternative # 1</p> <p>Of the three alternatives presented in the EIS, I have some concerns and/or objections with each, but Alternative # 1--Enhanced Bus Service is my preferred alternative for several reasons. Foremost, Alternative # 1 is the least expensive and least complex of the alternatives to implement, and one that emphasizes bus transit without additional lanes or lane manipulation on SR 210. It also does not increase the road capacity of SR 210 through the construction of additional lanes. Second, it does not negate the possibility of implementing either Alternative # 2 or # 3 at some time in the future, if necessary, to address a worsening traffic problem.</p> <p>I am not convinced that the snow sheds for this alternative, or Alternative # 2, are really needed. Is the estimated cost of the sheds (\$72 M), with berms or limited road realignment, justified by the anticipated reduction in total road closure time of SR 210 from avalanches in a typical winter season, especially if the number of vehicles traveling along SR 210 is substantially reduced through enhanced bus service, tolling, and possible construction of Peak Period Shoulder Lanes (PPSLs). Since the Alta and Snowbird resorts would be the chief beneficiaries of snow sheds, which would minimize road closure times, shouldn't they assist in funding shed construction, if either Alternative # 1 or # 2 is eventually selected ?</p> <p>I also have concerns about the construction of the avalanche (snow) sheds as an element of this alternative, specifically the impacts of soil erosion on the water quality of Little Cottonwood Creek resulting from shed construction. Even the best mitigation efforts (i.e., best management practices) would still likely result in increased sedimentation within Little Cottonwood Creek, at least over the short-term. Since Little Cottonwood Creek is a primary source of potable water for residents of the Salt Lake Valley, any degradation of its water quality is a serious matter. If the Enhanced Bus Service alternative is eventually implemented, I would strongly recommend that any proposed snow shed construction be deferred for at least a few years to allow for a comprehensive evaluation of the enhanced bus service option, in order to assess if the sheds are really needed.</p> <p>If Alternative # 1 is selected and implemented, I would hope that UTA integrates the two proposed mobility hubs into the existing network of UTA bus routes, and/or through a regional shuttle bus system (listed as a preliminary alternative to the Enhanced Bus Service) that would pick up riders at various locations within the Salt Lake Valley and transport them to one of the mobility hubs. Either system would allow skiers without automobiles to still access the LCC resorts through the Enhanced Bus Service alternative, or at least reduce traffic congestion at the mobility hubs if cars are left parked at shuttle pickup locations. I would assume that any shuttle bus system connecting to a mobility hub would only operate during the ski season when demand is greatest.</p> <p>Alternative # 2</p> <p>As per Alternative # 1, with respect to Alternative # 2 (Enhanced Bus Service in Peak Period Shoulder Lanes) I am primarily concerned about impacts to water quality in Little Cottonwood Creek from the construction of the proposed snow sheds and also from widening SR 210 to accommodate the Peak Period Shoulder Lanes (PPSLs). I concur that of all of the preliminary roadway alternatives evaluated the PPSL is the preferred option, but I fear that widening the road would actually encourage more traffic on SR 210 and likely lead to more accidents and fatalities due to speeding, especially during the descent from the resorts. Obviously, the proposed road widening in this alternative would have a much greater impact on the environment of LCC than Alternative # 1. Widening/realignment could possibly cause some uphill slopes to become unstable and create conditions for recurring mud- and landslides during and post-construction. Addressing such issues would increase project construction costs. My comments pertaining to the deferral of snow shed construction for Alternative # 1 also apply to Alternative # 2.</p> <p>Alternative # 3</p> <p>I am not in favor of Alternative # 3, the Gondola, as a means of transporting people between the valley and the resorts for a number of reasons. First," "the capital cost is much greater than any of the other infrastructure projects. I assume that the projected cost of \$312-343 M (Table 2-12 of Screening Report) is based on construction costs today, rather than 5, 10, or 15 years out ? This is significant sum of money that I feel could be better spent elsewhere--say other transportation needs or perhaps education. Would Snowbird and Alta be willing to cover partial costs of this project, since they would be the prime beneficiaries of a gondola ?</p> <p>Second, a completed gondola project would have a considerable visual impact on the beauty of LCC, not to mention the scars from construction itself. Third, as per road widening and snow shed construction of the other alternatives, but even more so, despite the implementation of best management practices, construction of a gondola would most certainly impact the water quality of Little Cottonwood Creek, but even more so due to the proximity of the towers to the creek.</p> <p>Third, while a gondola would likely be effectively utilized during the ski season, I question whether there would be much demand for transport to/from the resorts via a gondola during the rest of the year. Rather, I suspect it would be woefully underutilized during that period.</p> <p>Fourth, I cynically suspect that Alta, Snowbird, and the other nearby resorts would love to see the construction of a gondola as a first step toward connecting all of the area ski resorts via a series of lifts, which would destroy some of the last remaining backcountry ski areas in the central Wasatch.</p> <p>Finally, there is the issue of climate change that I note below. With increasing uncertainty regarding winter precipitation, snowpack conditions and duration in the future due to global warming, why invest in a gondola that might eventually see declining use during the ""peak"" ski season ?</p> <p>Further Comments:</p> <p>As I mentioned above, the selection of Alternative #1 by itself should not foreclose the option of implementing either Alternatives # 2 or # 3 at a later time, if it becomes clear that additional measures are needed to deal with the vehicular traffic problem in Little Cottonwood Canyon. Both of the latter alternatives require higher capital costs than Alternative # 1 owing to the widening of SR 210" (Alternative # 2) or the construction of the gondola (Alternative # 3). Furthermore, I fear both infrastructure projects could adversely affect the water quality of Little Cottonwood Creek.</p> <p>Additionally, before proceeding with either Alternative # 2 or # 3, we need to acknowledge and thoroughly assess the possible/probable impacts that climate change could have on the local ski resorts, specifically their business model, over the intermediate- and long-term. If greenhouse gas emissions are not arrested and fossil fuels phased out over the next 20-30 years, it is predicted that the annual snowpack in the Tri-Canyons area will be gradually reduced and the ski season will become shorter. These precipitation trends will impact the future economic viability of the resorts, as the revenue from lift ticket sales and season passes will likely decline over time.</p> <p>So why should we spend significant funds (for widening SR 210 or to construct a gondola) to address the traffic congestion problem in LCC during the winter months, in view of the potential adverse effects that climate change will have on Alta and Snowbird as destination ski resorts ? The potential but likely impacts that global warming will have on the annual precipitation and snowpack in the central Wasatch Mountains over the next several decades should give us serious pause before investing millions of dollars into the widening of SR 210 or construction of a gondola. The latter in particular could wind up being a ""white elephant"" if the demand for downhill skiing falls significantly due to poorer snow conditions and a progressively shorter ski season, and summer usage never meets expected demand.</p> <p>All three of the proposed alternatives have two mobility hubs--a north hub at the gravel pit near the mouth of Big Cottonwood Canyon, and a south hub at 9400 S and Highland Dr near the mouth of Little Cottonwood Canyon. Does UDOT or the State of Utah own the land where the north mobility hub would be sited ? If not, does the capital costs for the two mobility hubs include funding for the purchase of the gravel pit property, assuming the owner(s) are willing to sell ?</p> <p>I am a little disappointed that there is little information on proposed tolling as a strategy for incentivizing people to" take public transit to the resorts. The Travel Demand Management section under Alternative Components provides needs further elaboration /discussion which I hope will be forthcoming in the Draft EIS. I would recommend tolling over the entire winter (ski) season and also during weekends the rest of the year. Vehicle tolls should be based on based on the number of occupants in the vehicle; the more occupants the lower the toll (fee) regardless of time of year, and whether the travel is during peak or off-peak hours. Single-occupant vehicles should be allowed up LCC but charged a considerably higher toll to either encourage transit use or car pooling. Also, assuming there is some type of commercial or UTA bus service during the summer/fall months (not addressed in the Screening Report), tolling should operate in conjunction with the transit during that time. Thus, I am not sure I agree with the strategy of not charging tolls when traffic volume is light. Wouldn't this policy discourage people from taking bus transit ? Alternatively, it might be preferable to lower tolling fees during periods of lighter traffic (off-peak travel hours), rather than just eliminating the toll. Lastly, I concur that collecting a vehicle toll during the ski season only for those vehicles going to one of the resorts, with collection taking place near Snowbird. Vehicles parking lower down in the canyon for snowshoeing or backcountry skiing should not have to pay the same toll, or perhaps any toll, since the winter enhanced bus service would not make any stops along the way to the resorts. Tolling strategies and considerations need to be detailed in the draft EIS.</p>

6503	I support the enhanced bus service without canyon widening. As a skier, climber, hiker, I love this canyon for its summer activities in addition to its winter activities. Widening the road and the gondola would compromise access and experience for other outdoor activities	Anna Holman	Website
6504	There needs to be increased bus service in Little Cottonwood Canyon. No widening of the canyon road. The ski resorts need to fund the coverage for the project. The environmental impact of our canyons should be top priority. Absolutely, NO gondola!	Wendy Sears	Website
6505	We vote for Enhanced bus service with no additional LCC traffic and no road widening. No gondolas or any permanent infrastructure in the canyons that does not already exist. Car access to LCC must remain for those who wish to snowshoe, back country ski or rock and ice climb. The utmost attention must be made to preserve and enhance the community, unity and beauty of the city of Cottonwood Heights.	Lea Berry	Website
6506	I support option 1 and encourage UDOT to consider climbing access and environmental impact in any work done in Little Cottonwood Canyon.	Claire Russon	
6507	<p>As a former National Park Ranger, I believe in good resource management. The sharing of space between users and the balance that allows for many groups to enjoy an area. I grew up going to the Yosemite Valley and Zion I also recognize that sometimes for the resource to be enjoyed you may not be able to accommodate the droves of people would defend upon it demanding easy access to every space.</p> <p>Widening the road would be a mistake. This canyon is known world wide for its amazing granite rock climbs. It is known as a training ground for the amazing Yosemite climbs that Alex Honold has made famous. Widening the road would destroy renowned climbs and bouldering problems loved by climbers.</p> <p>The gondola is not a good option because it simply doesn't move enough people and would ruin the aesthetics for more people than it would help.</p> <p>I'm in favor of a better bus system. Perhaps a shuttle similar to Zion and Yosemite perhaps even required for those going to ski resorts.</p> <p>Also we should build a parking structure. Either where the parking lot is now or in the creek on the other side of Wasatch. Let's leave the eyesore in the city with all the other sky rises and preserve the beauty of the canyon that we all come to enjoy.</p> <p>Thank you for reaching out and working to help us all enjoy this Canyon.</p>	Katie Allred	Website
6508	Regarding the proposed option for solving traffic issues in LCC, I think option 1 will be the most efficient and does the least amount of damage. Developing a more convenient public transportation system will encourage more people to carpool, minimizing single rider vehicles. Option 1 also seems like an option that would put the least amount of stress on the plants and animals living in the canyons, saving the canyon from destructions.	Ting Ya Yu	Website

6521	<p>InTrack Motors is a dual mode electric vehicle manufacturer and we would like to propose our systems for your project. My friend Dave Brough of D A V E informed me recently about the harsh rejection dual mode had in the official documents for this EIS. Dual mode takes advantage of the present road system and available off the shelf EV technology. Either of our systems are superior the allowed options for this project that will destroy forest and provide marginal service to the target demographic. Widening the black asphalt of this nature site is the last thing we would want to do to the beautiful valley.</p> <p>Please accept this proposal as evidence that there are dual mode systems around the world and they should legally be allowed to bid this project. Our costs are significantly lower than the three that were allowed and our solution delivers faster, higher performance transportation. More importantly for the environment we are 100% clean where diesel buses are extremely polluting while hill climbing.</p> <p>See attached PowerPoint.</p> <p>Thank you.</p>	Jerry Roane	Email

#3855 - Taylor Dankmyer

As a summary, I support the Enhanced Bus with Roadway Widening, with the “Enhanced Bus” with no roadway widening as a 2nd place quicker immediate option for Little Cottonwood Canyon. I support the gondola the least for many reasons stated below. I also support tolling the road (with no tolling at lower canyon, and some tolling based on peak periods on the upper canyon).

Canyon Options

Let’s start with the basics. Little Cottonwood Canyon (LCC) gets 12,000 to 14,000 visitors on a normal winter weekend. The plans laid out mean to only remove 30% of the cars from the road. While these are the rules the Environmental Impact Study (EIS) is set to follow, if their goal is truly to build something that can handle traffic in 2050 (30 years from now), we will need much more than 30% of the cars off the road. And with just 30% of the cars off the road, traffic could be pretty terrible at peak times, and the wildlife impact would also remain. Below I considered all 3 options, strange trends I found in the Environmental Impact Statement, key issues with some of the proposals and where I think we can get the most benefit for the most people.

Strange EIS Study Trends

The biggest issue historically (in previous analysis for these plans) was that the gondola couldn’t handle a lot of people per hour + it was expensive. Somehow in the final analysis both of those concerns have disappeared, which I do not understand.

Specifically, because the EIS was only looking to analyze reducing car traffic by 30%, the EIS team fully admits (in their video conference public meetings in late June) that they “limited the capacity” of each transit option to reach that 30% level. That, in turn, makes each option look like it’s on a relatively even playing field when it comes to how many people each option can handle per hour. However, this is not helpful to the public. We need to see what “max capacity” looks like for any of these proposals. For example, how many people can we get up an hour if we were running gondolas at their max capacity (or had the max number of gondola cars on the route)? What speed would they run at? What does that look like in terms of capacity per hour?

Similarly, if we were to double or triple buses per hour, is that A) possible and B) what is the estimated amount of people?

In this same June meeting, it was mentioned multiple times that the group is looking at building something that will work till 2050. So why then is the EIS only proposing solutions that handle around 10% of the weekend visitation to the canyon? Their answer is “this is what we were tasked to do” but then in the same breath they use an argument around future-proofing the canyon until 2050 to argue against alternative proposals.

The Gondola

To that end, at one point it was mentioned (in previous discussions in years past) that the Gondola could hold 10,000 people an hour. The latest proposal, backed by private landowners, a massive gondola company (Doppelmayr), and the ski resorts themselves, is pushing the “la Caille” proposal which notably drops the gondola further down the canyon, builds a parking lot at the gondola station, and suggests it can get multiple thousands of people up in the peak 3-hour transit window on weekends (typically 7 AM - 10AMish?). However, this is not an official proposal from EIS, and seems to have been previously eliminated.

Furthermore, it appears the main appeal here, beyond removing the bus to gondola inconvenience, is that it says this proposal can handle higher capacity, but again, it is my understanding that the EIS purposely handcuffed each of 3 official proposals based on the rules they were given.

Without the actual max capacity numbers available to public commenters, the 3 proposals seem relatively unfinished. While I acknowledge that an environmental impact study (and implementation time) come in the next phase of the EIS, it seems almost disingenuous to not have this info included now while you collect public opinion (and then, therefore, use that public opinion to help drive your future decision making), when the public arguably didn't receive all the info it needed.

Taking the EIS at their word, the gondola can hold 1,000 people an hour. It also has to travel at a speed limit lower than that of the road due to that capacity (the EIS staff claims 17 MPH). Gondola proponents mention it can handle winds up to 78 MPH, but there is no mention of what speed the gondola must go in those winds. Guess what? It will go slower. Much slower. Slower than 17 MPH.

Taking that into account plus the full gondola trip taking an estimated 46 minutes (vs. 36 mins with the “enhanced bus” option), the gondola seems like the slowest option.

It's also the least flexible. We can't scale up the gondola at peak times (with a bus system, you could easily double or triple the buses going up the canyon per hour). You can't take the gondolas down easily when they are not needed. It doesn't fluctuate with seasons or rush hours. It will be built and we are stuck with it. If better tech exists in 2050, or climate change makes skiing LCC obsolete (I hope not!), we still have the gondola.

While I don't know the full capacity of the gondola (because of the limitations of the EIS), I can do some quick math on what it would mean to double or even triple bus capacity on Little Cottonwood Canyon, from the proposed 6 per resort per hour up to 12 or even 18 per resort per hour. If 6 per hour can handle 1,008 an hour, 12 per hour could handle 2,016 per hour, and 18 could handle 3,024 per hour.

If we're truly looking to build something sustainable for 2050, we have to consider which one of these options scales up the easiest? Adding additional gondola cars is likely not possible, and 2xing the speed of the gondola is also likely not possible. However, UTA operates a fleet of hundreds, maybe thousands of buses, and continues to add more, so our ability to move more buses into the canyon (and reduce them when not needed) is much easier. We have buses already. In lighter seasons, those same ski buses can be used to move people around the city.

As the years go on and traffic increases, you also can imagine a (smart) shift in strategy in 5 or 10 years, where the road goes to bus-only during rush hours. A gondola doesn't allow for that, and wouldn't seem to allow for the same massive amount of capacity a bus-only road could handle. Not to mention reducing traffic means fewer emissions and safer roads. On the issue of safety, the EIS's manager, Josh Van Jura, mentioned himself that while not a core part of the EIS, an additional lane up the canyon is safer (if not the safest of the 3 options) for bikers, motorists and pedestrians in the canyon.

On scaling this operation down come spring and summer, where we do not face the same peak flow issues we do in the winter, a bus system scales down much easier, as mentioned.

A bus also allows us to be flexible in the future with what stops to make. The Gondola only handles traffic to Alta and Snowbird. 70% of the traffic in the canyon are people that are ****not going**** to the resorts. It's for hikers, bikers, snowshoers, backcountry skiers. Building stops along the way on the Gondola is not part of the plan and would dramatically increase costs and time. But being able to build additional bus stops (that are seasonal) is a far easier proposition down the line if it is needed.

Don't worry - there's more! :) I have a few more concerns:

- The proposed gondola is roughly 2-3 miles longer than any other constructed gondola in the world. I remain skeptical that this can be done as easily as some contractors may say.
- With the gondola taking such a long time, climate control would be fairly necessary inside each gondola, and from what I read, this was not something any gondola currently had in the world.
- Summer gondola service should be No because we don't personally need more tourists in the canyons, as they are already under stress. A bus service that doesn't disrupt and stops at popular trailheads would be great. Reducing emissions and parking issues and safety concerns in the canyons in the Spring/Summer. And no permanent structure - the buses will leave the canyon at night time (vs. a permanent gondola).
- On trailhead parking, I think we should consider a way for people to take a bus to these spots + some additional parking. However, every parking lot up the canyon fills up, so having a reliable bus option in the summer sounds ideal.

- There is a lot of talk about the fact that the bus is still susceptible to avalanches. This is true, however, Snow sheds would limit the average closure from avalanches from 56 hours to 11 hours per year (this is according to the EIS' documents). That is an 80% reduction in roadway closures. Avalanche Hazard Index would be reduced from 90 to 59 with snow sheds added.

- As mentioned, we need to know build times. This isn't until the next phase, but we must know it. If an additional bus lane is going to take 8 years but a gondola takes 2 (or vice versa), the public needs to know.

- The EIS public meeting said, "I don't know that we have done a proper analysis for downtime due to gondolas." Please do an analysis that takes into account the weather, avalanches, & wind in the canyon for the gondola.

- As asked for, I support HOV And tolling of both the little cottonwood and big cottonwood canyon road (although this EIS is just for LCC). I also support lower canyon free tolling vs upper canyon tolling, as long as that doesn't lead to higher traffic congestion in some form (so, the logistics would have to be worked out).

- I heard it was mentioned that the gondola full travel time was 63 minutes. Is this true? Please clarify and provide more detail on travel time, as this was confusing during one of the public meetings.

Beyond that, None of these plans seem to actually care (or talk about) what the actual impact is to the canyons themselves. The ""Save Our Canyons"" folks have been saying this throughout the process and these proposals make it even clearer. I think a gondola would be pretty ugly going up the canyon. And building it certainly will impact the environment. I'd like to avoid it. If it got 5,000 people an hour I might consider it, but otherwise, it's the least interesting option. Not to mention all the tourists that will just ""want to take the gondola ride"" up LCC. It could become a tourist trap. Let's not turn the canyon into a theme park. And I think the impact to canyon views is pretty apparent: it's the worst/has the largest impact of the options.

I also don't see construction times anywhere. Were those listed? Some road changes seem much faster to implement than building an 8.5-mile gondola. But I read elsewhere that building any additional road would take far longer. We need to know the build times.

There has been this other concern from the public that people don't "want" to take the bus. Let's be clear: no one wants to do --anything-- currently. They want to keep doing what they're doing (driving their cars up the canyon). Public transit is built in many places in the US as the only possible alternative to everyone getting in their cars. For example, it was much cheaper (and far faster) for me to hop on a bus in Washington, DC when I lived there than it was to hop in my car and then try to find parking at my destination. I didn't ride the bus because I preferred it, it was literally *more* convenient. And faster. We need to make whatever alternative we offer do the same thing. Make it more convenient to do and more environmentally sustainable. A lot of

people don't take the bus now because you end up sitting in the same traffic line as all the other cars. So outside of giving buses priority, they ideally need their own lane as well.

Eventually, given the popularity of BCC and LCC & the growing population of Salt Lake City, people (and the city) have to make a tough choice. Restrict the road. FORCE (yes, force) people to take alternative transit through laws, tolls & dedicated bus lanes [or rush hours where those buses are the only vehicles that can go up the canyon (with exceptions for canyon residents and canyon employees)]. I would have loved to see more efforts in this direction with the Environmental Impact Statement proposals.

Overall, I support the ""Enhanced bus service in a dedicated shoulder lane"" option the most. I want to aggressively incentivize rapid transit over cars being in the canyon at all, to the tune of a much larger reduction than 30%, but if that is where we have to start, so be it. I will take the bus because I will get up the road a heck of a lot faster. Yes, it requires additional lane building in places. This will impact wildlife and the environment, but it seems minimal compared to a gondola. Again, I will wait to see the environmental impact study in the next round.

The other issue we run into is parking. We need additional parking capacity at the mouth of the canyon regardless of what option is chosen - and I know this is part of the options offered. However, the previous discussion of the bus options made the point that you could have more bus lanes coming from hot spots in the cities to better handle the load & areas where people were parked (which would put less pressure on the mouth of the canyon potentially). In other words, not everyone has to load at the mouth of the canyon, they can load in the valley, the mouth, Sugar House, other existing kiss n rides, etc. There's a lot we can do to reduce load and traffic at the mouth of the canyon through different bus line mapping and options. Some of that could be used in conjunction with a gondola plan, but a gondola plan still ends with everyone 1) getting off at the mouth of the canyon and parking 2) taking another bus to get to the gondola 3) getting on the gondola.

We could even use the existing bus lines that go up LCC: you could park right off I-15 and not get off the bus till you were at the resort. No transferring to another bus that takes you to a ""gondola bus"" that then takes you to the actual gondola. By the way, I'm wondering what's behind having to take a bus to get to the gondola - was it a cost-saving measure?

The bus options also allow for a lot more flexibility- seasonal flexibility, rush hour flexibility, we can change rider and lane laws (say, HOV) later based on demand and population growth. It's also a lot more value to the city (the SLC Mayor wants more public transit so give us more buses we can use them around the city and suburbs) and should be able to carry more people vs I don't think we have any path to ever getting more than 1,000 people per hour on that gondola based on the data provided.

I know some of the lift supporters I've read think the gondola will be weatherproof compared to a bus having to deal with one of the most active avalanche zones in North America, but that

seems like a mighty unknown. I have already discussed that snow sheds reduce road closures by 80% and reduce the avalanche hazard index from 90% to 59%. There are plenty of wind-holds to deal with gondolas, but maybe there is a way around that, otherwise I would like more info on that piece of gondolas. We already have some of the best avalanche detection and clearing in the US in LCC. So I don't mind that the buses will have to deal with that (as any car would). But it's certainly a negative. But I just can't get behind a gondola going up that Canyon. Especially if I also would have to take a bus to get to it.

#3922 - Kirk Nichols

1. First, In the broadest of views, not yet getting to the details, the alternatives offered by U-DOT are inadequate to meet the spirit of NEPA (read the introduction to NEPA) or the CEQ regulations for NEPA.

The CEQ regulations offer general guidance to agencies in 40 C.F.R. §1508.25, which requires consideration of three types of actions, three types of impacts, and three types of alternatives in determining the scope of an EIS.

ACTIONS include (1)Connected, (2)Cumulative, and (3)Similar Actions.

IMPACTS may be (1)Direct, (2) Indirect, or (3) Cumulative.

ALTERNATIVES include (1)Primary, (2)Secondary, (3)No Action.

The action of this LCC-EIS is to plan and execute one of the alternatives to solve transportation problems in LCC. U-DOT is trying to say that only delivery of clients to the ski resorts solves their definition of the transportation problems in LCC. The U-DOT LCC-EIS neglects all the foreseeable connected, cumulative, and similar extant problems or the foreseeable affects that their alternatives will create. Actions such as alterations in parking lots, changes in roadside parking, imposing a fee are all connected and unaddressed actions that NEPA requires to be studied. U-DOT has not addressed the foreseeable impacts of their transportation solution of delivering clients to the resorts such as impacts on trails, vegetation, and wildlife. Everything U-DOT does in LCC, more busses, more pavement, more transportation systems and altered pathways will have year-round, full canyon direct, indirect, or cumulative impacts at the trailheads and parking and cyclists along the length of the roadway. These are not addressed in their alternatives nor in their purpose and goal statement. This negligence is across all three alternatives. Summer season vehicles are transportation and a problem in LCC and these are blatantly rejected as problems in the U-DOT LCC-EIS.

U-DOT neglecting connected, cumulative, and similar actions is what paused the Legacy Highway at immense tax payer expense. Let's avoid the delays here.

An EIS is required by Congress to be developed by an interdisciplinary team, U-DOT has developed this EIS unilaterally.

2. Now a few details quoted from the LCC-EIS. Quotes are in added italics:

"P.IV: Table S-1. Alternatives and Options To Be Evaluated in the Draft EIS"

In a Draft EIS the preferred alternative must be disclosed, it is not. In a Draft EIS a "No Action" alternative must be studied and discussed at the level of all alternatives, it is not in the LCC-EIS.

“b The purpose of the project is to improve winter mobility. Screening criteria did not evaluate the performance of summer service.”

Winter mobility is not the only transportation issue connected to Little Cottonwood Canyon, all season transportation problems are connected. Therefore, all connected transportation issues must be studied in one EIS. The U-DOT LCC-EIS appears to be segmenting the LCC issues; please look at the CEQ Regulations”

1. Connected actions

The CEQ regulations require “connected actions” to be considered together in a single EIS. See 40 C.F.R. § 1508.25(a)(1) (1984). “Connected actions” are defined, in a somewhat redundant fashion, as actions that

“(i) Automatically trigger other actions which may require environmental impact statements.

(ii) Cannot or will not proceed unless other actions are taken previously or simultaneously.

(iii) Are interdependent parts of a larger action and depend on the larger action for their justification.”

“Winter point-to-point bus service from mobility hub directly to the ski resort”

Studying only the point-to-point resort traffic is inadequate to address all the year-round and connected transportation issues and actions needing to be resolved in the LCC-EIS.

“Tolling or other management strategies such as no single occupant vehicles during peak periods”

Tolling and management strategies are year-round and connected issues that must be studied year-round in an adequate EIS.

“Winter gondola service starting at the gondola platform at the entrance of Little Cottonwood Canyon with stops at Snowbird ski resort and Alta ski resort only”

Stopping only at commercial ski resorts should be paid for by the ski resorts, not the general public.

“The transportation needs in the study area are related primarily to traffic during peak periods, avalanche risk and avalanche control in Little Cottonwood Canyon, multiple roadside users in constrained areas, and anticipated future increases in visitation to Little Cottonwood Canyon as a result of population growth in Utah.”

This EIS completely misses the hard look required to evaluate the latent demand, people in the valley who currently reduce or curtail their trips to the canyons due to the congestion. This summer's congestion in the local canyons due to of COVID-19 gives us hint of the latent demand for local canyon use. U-DOT is using only future growth in its projections when latent demand might be greater.

“Reduced mobility on S.R. 210 near trailheads and at ski areas. Loss of shoulder area for cyclists and pedestrians, which forces them into the roadway travel lane and creates a safety concern. Creation of informal trailheads that contribute to erosion, mineral soil loss, the spread of invasive weeds, watershed degradation, and loss of native vegetation in the canyon. Damage to the pavement along the roadway edge, which causes increased soil erosion, runoff into nearby streams, and watershed degradation”

In the U-DOT LCC-EIS, UDOT is recognizing all the above, four season problems but are negligent in addressing the greater traffic that does not involve the ski resorts.

The LCC-EIS spends an inordinate amount of time and study on visitor cars from Park City (p. 60) when 1000's of cars are parked along the side of the road winter and more in summer and unilaterally are not even being considered in this study?

I am concerned that a great deal of attention was given to the out-of-state traffic from Park City to Alta and Snowbird, which is less than 8% of the traffic, yet 100% of the three season traffic was not included in this EIS.

3. Third, general observations:

More pavement always means less storm water absorption leading to more roadside landslides and more silt in the creeks, more oil and petroleum in the soil and water. Widening these canyon roads means more road cuts, more roadkill animals, and more accidents in the canyons. Wider pavement, especially in BCC, means more stream channeling which means higher stream temperatures, less streamside vegetation, and reduced and disrupted aquatic life due to increased stream gradient and reduced aquatic habitat types.

Busses can be slow and polluting, however, the busses that have been used in the canyons in recent years have rarely slowed the traffic the way they used to. Inexperienced automobile drivers with poor tires are the bigger slowdown in the canyons. Safety for cyclists allows me to consider wider shoulders (using geo-foam as per the University of Utah student study) and no roadside parking, which requires bus or shuttle pull-outs for drop-off at all trailheads and picnic areas. The U-DOT alternatives specifically exclude these necessary stops as the U-DOT alternatives only consider commercial traffic to the ski resorts. The Park City, Bonanza Flats, initiated drop-off only at Guardsman's Pass has been a huge success for reducing road

congestion on the pass. Any acceptable alternative from U-DOT must allow for drop-offs throughout the canyons. Private shuttles are proving to be a commercially viable service in Big Cottonwood.

The gondola is an interesting alternative that, from lack of detail, I am not sure U-DOT is serious about. Will the towers be roadside or will each tower require a spur road to service it?" "Will a permanent swath of trees need to be cut? How much private property will be condemned or purchased or require U-DOT to purchase an easement? Will the gondola provide (unfortunately) aerial views into backyards and back windows? Will the gondola follow the creek with all the problems that involves? Again U-DOT is proposing to only service the commercial interests in the canyons making the gondola completely of no value to anyone but the commercial clients of the resorts. Residents will never ride it except as entertainment.

While the three alternatives exclusively feed the two ski resorts, other area businesses are excluded. Businesses that supply goods for hikers, climbers, backcountry skiers, snowshoers, fishers, cyclists, etc. are excluded from benefitting from these public tax dollars spent on the resorts. There is no reason for local and regional stores such as Black Diamond, REI, IME, etc. to support any of these three alternatives.

I favor the bus only solution but only with the modification of stops through-out the canyons at all trailheads for all seasons for all citizens. I recognize that this will require paving bus-stop turnouts at trailheads.

I am concerned that the LCC-EIS by U-DOT only considers commercial traffic to the ski resorts in winter.

I am concerned that two thirds of the canyon traffic has not yet been considered in the LCC-EIS by U-DOT. That unconsidered traffic is in two components, 1. that of the three season (spring, summer, and fall that is greater than the winter traffic to the two resorts) traffic not going to the resorts in winter and 2. the winter traffic not going to resorts but to other stops along the LCC transportation corridor.

I am concerned that no consideration or study was given to the majority of the traffic which stops along the canyon in places other than the commercial ski resorts.

I am concerned that the public will not accept any of these three alternatives that service commercial interests only and not serve the general public. The general public will therefore reject the EIS and we have to start over again with yet another study and plan.

I am concerned that U-DOT refused to study the latent demand built-up with-in the valley population and based their planning on only future growth. This unique time of "stay home –

stay safe” is illustrating that the latent demand is greater than the 50 year growth projections that U-DOT based their study on.

Gondolas have good qualities, but until the U-DOT EIS requires designs that have pull-out stops and detachable cars for climbing areas, hiking areas, and back country ski areas, gondolas are not the holistic solution that the public needs. Great for the resorts, not so great for the majority of canyon visitors.

When a gondola system does go down, what is the estimated time for rescuing all of the passengers? Will each passenger be required to rappel down a rope? (The Swiss will have a solution.) Will each car have a bathroom while they wait hours for a rescue? In the long traffic lines currently plaguing the canyons people do hop out of their cars and pee on the highway between the cars.

Ski resorts hire and release hundreds (1000's?) of trained employees every year, if that is an issue, so too can UTA hire seasonal drivers.

The gondola system proposed for the Jungfrau region is all straight-line cables. Compared to Big Cottonwood, Little is pretty straight, but still not straight. Those Swiss valleys are wide, pastoral (they cut down all the trees centuries ago), and not particularly steep above Grindelvald.

U-DOT, thanks for your work so far, you have more to go to meet the requirement of NEPA and to meet the needs of the general public and not just the ski resorts.

Comments on Little Cottonwood Canyon Environmental Impact Statement SR 210 – Wasatch Boulevard to Alta, Utah Department of Transportation, June 8, 2020
by Michael Allegra, President, KivAllegra Consulting

Overall

The train is best overall long term, year-round and cost-effective solution. It should not have been eliminated during the screening process. It appears that they chose one of the most expensive rail design options while grossly exaggerating the capital cost estimates and compared it to the simplest configuration and cheapest gondola solution. The report does not have the Cog Railway on a level playing field with the other alternatives. This mismatch of alternatives scenarios needs to be rectified or could be grounds for an environmental challenge.

A life cycle cost analysis is the best tool to compare a diverse set of modes and should have been prepared.

A 9-mile Cog Railway is being completely rebuilt in Pike's Peak, Colorado for a total cost of \$110 million or \$12 million per mile. This report uses \$138-\$169 million per mile.

A train can be built with minimal construction impacts as seen by the real-world experience in constructing the Pike's Peak Railway.

A train is the most environmentally friendly for air quality, watershed quality, energy consumption, congestion relief, economic development, land use management, pedestrian compatibility, and visual aesthetics, and is the most consistent with the Canyon's core values. The impacts to our wilderness areas and boundaries are unclear.

The rail solution has the best potential for a one-seat ride from the Salt Lake International Airport or downtown Salt Lake City and would allow transit access to ALL the residents in the Wasatch Front via Trax or the Frontrunner.

A Cog train has the highest potential carrying capacity of all the modes and can easily be adjusted for peak vs off peak demand, and it can service intermediate stops. A gondola does not have this ability.

The report suggests a gondola every 25 seconds or a bus every 2.5 minutes or a train every 15 minutes. In the canyon, in both directions, this means a gondola every few hundred feet or a bus every quarter mile. Imagine the visual aesthetic impact of these alternative versus that of two trains every hour.

The gondola has no heat or air conditioning. It is primarily a ski resort chair lift. Evacuating passengers from gondola cabins is extremely dangerous, especially in inclement weather.

Although a massive park and ride lot for 2500 cars is recommended for LCC needs, the report ignores the parking needs and requirements for BCC. Stalls for up 5000 cars might be necessary for both canyons and all users.

Technical & Policy Issues

Most major capital transit investments require a long-range travel forecast. The analysis picks a 2050 horizon year but makes no assessment of what the needs are. Additionally, in one place, it refers to a 2050 auto count which only represents a 1% growth rate per year. This has NEVER happened in Utah since we started keeping traffic counts. Typically, in Utah, we have had a 2% population growth rate and a 5-6% increase in traffic annually. Any forecasts that suggests a 1% growth rate are suspect and could be challenged.

All major transit capital projects look at year-round use. What do you do with the vehicles and equipment if only used in the winter? Do you shut the gondola down in the summer? In the past, UTA has been required to use its ski buses during summer months. This cost should be factored in. It is inappropriate and bad public policy to plan a major public investment just for only a brief part of the year without a discussion of the use of this equipment at other times.

The only fair comparison between modes is Life Cycle Costs. Especially when the horizon year is 2050. Why wasn't this done? It is standard industry practice. In this time period a bus would need to be replaced 3 times whereas a train is able to last much longer. Many rail systems are 50+ years old. Additionally, the biggest costs in transit is the cost of labor. A bus carries 42 passengers with 1 operator, a train carries 240 passengers with 1 operator. Typically, the costs for operations and maintenance are greater in a 30-year time frame than the initial capital costs. The failure to address Life Cycle Costs seems to be a systemic failure of the report and it questions the validity of the entire report.

The report poorly and myopically addresses the purpose and need. For example, it only refers winter service. But this is not in the purpose and need. The 30th highest traffic count may work for highway design but is not relevant for transit planning. As another example, the purpose and need talks about safety but the only real measurement they use is the protection from avalanches. It's possible that this was written when UDOT was just looking for short term solutions and not sufficiently thought through for larger capital expenditures. This appears to be a major process weakness and could be subject to a legal challenge

An appropriate and fair EIS would provide similar alternative scenarios to compare. A gondola from the bottom of LCC with a feeder bus is not comparable to a rail alternative from the middle of the valley in an exclusive corridor up LCC. Clearly the residential impacts of rail in the 'city'

are significant. The report should have used the same feeder bus alternative as the gondola. Additionally, the author placed the Rail alternative in an exclusive alignment when it clearly could have been placed in the same location of the bus-only lane. These biased, unbalanced and unequal comparisons raise serious questions.

The protection from avalanches is not the only safety factor to be considered. The report Does Not consider the safety of riding in a particular more. Why was this? It is a standard level of professionalism that was not applied.

A big advantage of railways is its adaptability to fit into any built environment. Historically, the road in the upper parts of the canyon are built on top of the LCC railway that was constructed and operated over 100 years ago.

The Pikes Peak Cog Railway in Colorado is being built for \$110 M or \$12 million per mile. It has many of the same characteristics that are applicable to LCC. There are many examples and lessons learned that Utah should apply to this analysis.

A Cog rail can be constructed adjacent to the roadway with state-of-the-art construction that minimizes impacts and costs. A Cog railway can be built as a diesel system and converted to electric in another phase.

Overarching Issues

1-UDOT is certified by FHWA to prepare and sign Federal Highway Environmental Impact Statements (EIS). The content of this report is so erroneously written and professionally wrong that UDOT could lose this privilege. The deficiencies in this report could easily be legally challenged by opposing parties.

2-Alternatives are not equally addressed and evaluated. The report is clearly biased towards making some alternatives look better than others. In order for alternatives to be fairly compared, they need to have a similar basis. You cannot compare a rail line from 9400 S. and 2000 E (with urban traffic and residential/business issues) with a gondola at the base of Little Cottonwood Canyon fed by buses from 7200 S. and Wasatch Boulevard.

3-There is no forecast for future use. This is unprincipled. The report just simply tries to compare modes to match a certain hourly capacity. Major capital transit Investments require knowing what your build-out future year ridership is.

4-It is bad public policy to plan and design major capital expenditures for a peak seasonal use. You would not expect to invest significant public monies in a transportation system that only satisfies a couple of private businesses for a few months per year. Typically, highways are designed for the 30th highest traffic counts. Public transit systems are expected to be used

year-round and the public should expect to know the impacts during the off-peak seasons. For example, there is no discussion on what to do with the bus system during the non-ski season.

5-The report does not respond to its own purpose and need. This is a typical Achilles heel for EISs. For example, the report should have evaluated all the safety factors that might impact the Little Cottonwood Corridor, yet the only safety criterion it evaluates is protection from avalanches. Although this is an important feature, the report totally disregards the larger safety picture. An evaluation of the safety of driving on the road is completely missing as is a comparison of safety between transit modes. As another example, there is no discussion of the safety aspects of evacuating patrons from a disabled gondola between towers. Additionally, the report does an inadequate job of addressing congestion relief. It does not address the impact of those cars and buses coming to a base lot and feeding a gondola. The report mentions a 2,500-car parking lot would be needed at the mouth of BCC. It ignores the travel issues in BCC and fails to point out that additional stalls would be required for BCC. External travel trips are typically included in EISs. This would bring this parking lot total closer to double its recommended size (potentially 5,000 cars!).

6-The report appears to ignore an overwhelming number of comments that support including rail as an alternative. This reflects a clear bias of the report.

7-Many of the transit costs and issues are incorrect or all together ignored. A typical problem with transit is deadhead time and costs. The public hates seeing empty buses. The report fails to address the massive expense of taking a large fleet of buses from a central garage and deadheading them throughout the day. It uses NTD data base for bus operating costs which reflect the cost of running buses in the city. It is NOT the same as running in the canyons.

8-Most striking is the discussion on frequencies. The report refers to a train running every 15 minutes, a bus running every 2 ½ minutes (or 1 ¼ minutes in both directions) and a gondola every 25 seconds (or virtually a string of gondola cars in both directions). This suggests that at any one point in time, there would be either 3 trains or 48 buses or 120 gondola cabins. This translates to a gondola cabin every 800 feet (or 400 feet in both directions) from end of the canyon to the other. The report ignores these visual impacts.

9-The report's cost estimates for rail are wildly inflated. Contemporary estimates are about \$58 million per mile and Pikes Peak COG Railway in Colorado is being built for far less - \$12 million per mile. This is substantially less than the report's estimate of \$138-\$169 million per mile. Additionally, while the overhead costs for the gondola are only 10%, the report uses a whopping 47% increase in costs for overhead on the rail. This is hundreds of millions of dollars in unnecessary costs.

10-The report reads more like a justification for a solution than a document for evaluating alternatives

11-The report started out with a discussion on how to mitigate avalanche impacts and morphs into a full blow major transit capital alternative analysis with apparent change in purpose and need or evaluation criteria. This is a fundamental flaw.

Text Comments

Executive Summary, Results of the Screening Process, p i

Report-“reliability refers to closure of SR 210 from avalanches and avalanche mitigation” and “mobility refers to travel time and vehicle backups caused by congestion”

Comment- these are very myopic, limiting and auto centric criteria. These are not the appropriate measurements of reliability and mobility to judge transit alternatives. These are not the standard in the transit industry. This is a classic case of using a highway methodology to evaluate transit solutions. Using these stated criteria and measurements bias the entire report.

Executive Summary, Alternatives Advanced for Further Evaluation in the Draft EIS, Table S-1, p iv

Report-“24 buses per hour in the peak hour”

Comment-assuming a round trip travel time of one hour, this is a bus every 2.5 minutes in one direction or 1 ¼ minutes in both directions.

Report-“2,500 new parking spaces divided between two mobility hubs at the gravel pit and 9400 South and Highland Drive”

Comment- This report fails to recognize or account for the larger lot size required at the ‘gravel’ pit due to traffic in Big Cottonwood Canyon. It would seem logical to include this (external) impact in an EIS”

Report-“2,500 space parking structure at the gravel pit”

Comment- why isn’t this the same for the bus alternative? Why aren’t buses proposed from 9400S. and Highland Drive? This seems terribly biased

Report-“Enhanced bus service from the gravel pit to the gondola loading platform at the entrance of LCC ...”

Comments. This means that a separate, seasonal, and fully costed bus system would need to be estimated to transport passengers the short distance from the mouth of BCC to LCC. This should also account for the significant deadhead mileage and costs. What do all these buses do in the off-peak?

1.0 Introduction, 1.1 Report Purpose and Background Information, p 1

Report-“As UDOT receives input from the public and agencies during the EIS process, the results of this process might be modified”

Comment- It is requested that the Rail Alternative be reevaluated and reconsidered using appropriate and real criteria and performance measurements and using equal transit alternative

comparisons. Also, there were significant numbers of comments to support this in earlier public feedback. Fair and equal consideration needs to be given all transit choices.

1.2 Summary of the Project Purpose and Need, p 3

Report-“ ...UDOT’s purpose is reflected in one primary objective for SR 210: Substantially improve transportation related safety, reliability and mobility on SR 210 from Fort Union Boulevard through the town of Alta for all users on SR 210.

Comment- same as above, reliability and mobility only are focused on road related and avalanche issues.

1.3 Screening Process Overview, p 4

Report-bullet 5-“ Apply secondary (Level 2) screening criteria to eliminate alternatives that might meet the purpose and need for the project but would be unreasonable for other reasons.....”

Comment- A rail alternative from the mouth of LCC to Alta should be equally compared to a gondola or bus from the mouth of LCC. This was not done. The rail alternative from 9400 South and Highland should be compared to the same starting point for the gondola. You can’t compare apples and oranges.

Additionally, if another (new) location for a base gondola is considered, this should be equally compared to all modes and the EIS would need to be edited to reflect this.

Also, a rail alternative can run adjacent and next to the existing roadway (just like the widened lanes for buses). An entirely separate and exclusive rail alignment is highly unnecessary and completely bias’s the report with impacts to the natural and human environment.

1.3.2.2 Second Preliminary Evaluation of Concepts and Alternatives, p8

Report-“the preliminary concepts and alternatives were not developed in enough detail to conduct traffic modeling....”

Comment-Every transit EIS for major capital investments have a ridership forecasting process. This is a fundamental premise to invest in transit solutions and should not be ignored.

1.3.3 Level 1 Screening Process, Table 1-1, Level 1 Screening Criteria (Purpose and Need), p9

Report-Table 1-1 are all auto related criteria

Comment- Transit Criteria should be used to measure transit alternatives

1.3.4 Level 2 Screening Process, Compare Impacts and Costs to Benefits, p 10

Report-“Alternatives that have the same or similar benefits to other alternatives but have substantially greater impacts or costs will be eliminated”

Comment- This report fails to recognize the growing role of Private-Public partnerships and its significant impact on public costs. Typically, gondolas and Cog railways are privately financed. Pike’s Peak Cog railway in Colorado is all privately paying for both capital and operating costs.

2.1.2.1.1 Mass Transit Alternative, p23

Report-“.. research has found that mass transit alternatives are efficient only in areas with a population of over 200,000 (FHWA 1987)”

Comment-This is an extreme overgeneralization from a 33 year old report and is completely irrelevant to this study.

2.1.2.2.3 Level 1 Screening Methodology, 27

Report-“...UDOT applied a 1.1% linear annual growth rate for Wasatch Boulevard and a 0.5 % linear annual growth rate for side streets...to develop the 2050 annual average daily traffic...”

Comment- This just seems wrong and inconsistent with reality for this study area.

2.2.1 Range of Alternatives, Table 2-8 Preliminary Alternatives-SR 210, P 34

Report-“ Rail Transit Alternative. The rail alternative includes options to connect to UTA’s existing light-rail system (TRAX)’

Comment- Why wouldn’t you connect to the Frontrunner as well?

2.2.2.1.3 Managed-lane Concepts, Reversible-lane Alternative with Overhead Lane-Control Signs, 40

Report-“Because of the potential visual impacts, the Reversible-lane Alternative with Overhead Lane-control Signs was not carried forward for further discussions”

Comment-Why wasn’t this same criterion applied to the gondola?

2.2.2.2.1 Bus Alternatives, p 42

Report-“....(bus)headways less than 5 minutes would be infeasible.....”

Comment- They say this standard throughout the report but go on to recommend bus headways at 2.5 minutes. (which is 1 ¼ minutes in both directions)

2.2.2.2.1 Bus Technology, p44

Report-“ Because electric bus technology is still evolving, electric buses were eliminated from consideration”

Comment- Seems very shortsighted, especially if the horizon year is 2050!

2.2.2.2.1 Regional Shuttle Bus System Alternative, p45

Report-“ Considering feeder services prior to the operation of the mobility hub(s) would be speculative because it would be difficult for UTA to determine the demand and best location for feeder service without understanding the actual demand and function of the mobility hub(s) concept first

Comment- UDOT paid for this? They should get their money back.

2.2.2.2.3 Rail Transit Alternative, Co Rail Alternatives Evaluated, p54

Report-“.... Train vehicle to operate on steeper grades, around 10% to 15%”

Comment- An adhesion (non Cog) railway was built and ran in LCC over 100 years ago.

2.2.2.2.3 Rail Transit Alternative, Co Rail Alternatives Evaluated, p54

Report-the 5 alternatives for evaluation

Comment- why wasn't the same comparisons made for gondola and also include a Cog alternative that mirrors the gondola? It would be fair to have a Cog alternative from the base of LCC with a feeder bus (same as gondola). This seems like a fatal flaw in the report.

2.2.2.2.3 Cog rail Alternatives Comparison, p56

Report-Table 2-13 Capital Costs ranging from \$1.2 Billion to \$2.4 Billion

Comment- This translates to approximately \$180 Million per mile. UTA's first Trax line was built for \$9 Million per mile. Pike's Peak Cog Railway is being built for \$12 Million per mile.

2.2.2.2.3 Cog rail Alternatives Comparison, p 54-59

Reports-Tables and text

Comments-This entire section is fatally flawed. Not only are the capital costs absurdly high, the selection of Alternative 4B is obviously the one with the most impacts. Why would the author do that? How could Alternative 1 be screened out, when it essentially the same as the gondola (with feeder buses)?

An 8 mile Cog railway running at 15 minute headways can easily be run with a single track and some passing sidings. This system could follow the existing road. It was there before. It is less expensive per mile to build track than two lanes of traffic. Electrification would be nice but not required. The latest construction for retaining walls save on costs and minimize construction impacts.

Based on the above, the entire report is flawed and subject to major scrutiny.

Cog rail should be put back in the analysis and competently evaluated by non-biased parties.

2.2.2.3.3 Level 1 Screening Methodology, p66

Report- "...UDOT used 1.89 occupants per vehicle....."

Comment- why wasn't carpooling considered an alternative? It is the cheapest solution!

2.2.2.3.2 Level 1 screening, Table 2-20, p 67

Report- This table describes various walking times for transit patrons.

Comment- Why aren't there walking times at the resorts for auto users?

2.2.2.4.1 Level 2 Screening Results, p 75

Report- "Therefore, based on the high cost and impacts to residential properties and Section 4(f) properties, UDOT eliminated the cog rail alternative from further evaluation in the EIS"

Comment- A realistic rail alternative should be developed and re-evaluated.

3.0 Alternatives Development and Screening Process- Improve Reliability and Safety, p76

Report- "Improving reliability on SR 210 is focused on safety concerns associated with avalanche hazards and trailhead parking"

Comment- these are myopic and extremely limited focused criteria that don't fully deal with reliability and safety

3.1.2.2.4 Level 1 screening results, p 89

Report-Table 3-4 Level 1 Screening Results-Avalanche Mitigation. This table refers to 2018 and 2050 traffic volumes

Comment-these traffic volumes suggest an annual growth rate of 1% for the next 30 years. Is this realistic?

#6027 - Brad Rutledge, Wasatch Backcountry Alliance

I am submitting this official comment on behalf of Wasatch Backcountry Alliance and the thousands of members who we represent.

In our comment regarding the original EIS Scope and Need process in May 2018, Wasatch Backcountry Alliance's comment began with this statement: "Wasatch Backcountry Alliance (WBA) envisions a low cost, low emission, energy efficient year-round multi-modal transportation scenario for improving the current traffic situation in Little Cottonwood Canyon (LCC). The system we envision must be capable of providing efficient and predictable service for travel to both developed locations (ski resorts) and to trailheads and other stopping points for dispersed use in LCC. Any improvements being made in LCC should be tied in to a larger transportation system that serves and benefits the entire Central Wasatch." To that end, with regard to the current LCC EIS, WBA supports enhanced busing with no widening of Highway 210.

WBA firmly believes that before any transportation system is selected, there must be a thorough analysis of the carrying capacity of Little Cottonwood Canyon. This will help establish the volume of people that need to be moved up and down the canyon, which will invariably help determine which transportation system best fits that purpose and need. WBA strongly encourages UDOT to work with other stakeholders, including the US Forest Service and Salt Lake County, to undertake a carrying capacity analysis and to make that part of the current EIS.

With regards to the two options that use more buses (extended bus service and widening of the LCC road to accommodate yet-more buses), WBA continues to support the same concept that we stated in our May 2018 Scope and Need comment: "The transportation system should use the best currently available technology to serve all user groups on a year-round basis. WBA believes that the best currently available technology that meets our criteria is a flexible and dynamic fleet of energy efficient buses and vans using a series of transportation hubs." At this point in time, we do not think that Highway 210 should be widened to accommodate more vehicles, but that having dedicated times for buses and cars with 4 people (ie. 7-9am and 3-5pm) should be more thoroughly explored.

The most-recent EIS document clearly reflects a lot of work done on the part of UDOT, but it also generates many questions and we feel there are some important fundamental flaws that should be addressed. To that point, we have some comments about what we regard as key issues with this EIS:

> The current EIS does not address the concept of multiple Mobility Hubs other than the one on 9400 South and the one at the Gravel Pit. WBA thinks that the transit system needs to originate at locations around the valley (ie. U of U/Foothill, downtown, airport, WVC, Draper, West Jordan and points farther south, etc.) so that people can access the bus where they live, rather than

drive their car to a mobility hub to catch the bus. When faced with this choice, we suspect many people will choose to remain in their cars rather than use the bus.

> There is very little discussion of the needs of non-ski resort, dispersed users (in particular with regards to the White Pine trailhead, which has already increased in use to the point where it's dangerous due to on-highway parking in both summer and winter).

> We do not see any financial life cycle analysis (capital and operation, maintenance) of any of the options presented over the projected timeframe. Given that the least-expensive option will come at a cost of ~\$100 for every single Utahn, this is relevant).

> There is no mention of any interim solutions, and according to a UDOT spokesperson, UDOT has "no idea" what to do in the interim, nor are there any approximate timelines to actually identify what the "interim" is. LCC is facing an acute problem now that will only worsen, and the lack of timelines is a major missing component of the EIS.

> There is only token consideration given to the effects of each of the options on the vital LCC watershed, either by construction or ongoing use.

> There is very little/no mention of tolling on vehicles, though it is our understanding that the Utah state legislature specifically allocated considerable monies to UDOT to consider tolling, and as noted above, the Wasatch Backcountry Alliance is a proponent of tolling.

> The EIS provides no rationale for UDOT's winnowing of 35 different options to these three.

Based on our review of the EIS, the focus of the document and the tone of the online meetings on June 23-24, despite there being three alternatives in the EIS, it seems that the gondola option is being pushed as the preferred option. While we recognize that there may be potential benefits of a gondola operation, there are important components of it that we take issue with:

> Volume – the gondola as proposed will only carry about 1/3 of those people heading up LCC. This means that 2/3 will still be on the LCC road, so how does installing a gondola at cost of ~\$400M make any sense if it will not help alleviate the traffic issue currently plaguing LCC and the surrounding Sandy and Cottonwood Heights communities?

> Summer use – We understand that an important need of the EIS is to address the peak use times during the winter. However, traffic (and parking) in LCC is an issue year-round, and traffic-related issues are not limited to peak/storm periods. Summertime traffic as it relates to bicyclists needs to be addressed, particularly in the early fall when Snowbird's two-month long "Oktoberfest" is in full swing, given that event has a large focus on drinking alcohol at the top of a steep windy canyon.

> Schedule – Backcountry enthusiasts, employees, and contractors travel the canyon at all hours. Scheduling gondola availability for only the peak skiing hours transforms it from a transportation solution to a taxpayer-paid ski lift that benefits two private companies that operate largely on public land.

> Fees – there was no mention of the potential costs to riders. If fees are prohibitive, the system won't be utilized. Given the vast majority of people riding a gondola will be going to the ski areas, will the ski areas supplement/offset the cost of the gondola as they currently do with the bus?

> Roadway use – will vehicles driving up the canyon be tolled? The state legislature allocated a lot of taxpayer dollars towards the concept of tolling, and creating financial disincentives to drive up the canyon and use the gondola (or any transit system) is imperative. This could also include paid parking in all of upper LCC (ie. starting at Snowbird Entry 1).

> While fees and schedules could easily be considered TBD details and perhaps that is why they were not included, the gondola's schedule and fees are essential components to its success.

> Highway 210 improvements – there was no mention of improvements to Hwy 210 in addition to the gondola. For service vehicles, delivery trucks, residents, emergency vehicles, and those who don't use the gondola, the threats that the canyon represents will still exist. For example, if the gondola is chosen, will any improvements be made to Hwy 210, ie. snowsheds?

> UTA buses – there was no mention of bus service; again, perhaps a TBD detail, but given the continued growth in use, there is no doubt that bus service will be an important component as well even if the gondola is chosen given that a majority of people will still be traveling up LCC on the road.

> Convenience of travel – the three-step process for getting up the canyon using the gondola (drive your car to one of two intermodal hubs, put on your ski gear (plus potentially help your kids with their gear) to get on a bus, get off the bus to get on the gondola, and finally get off the gondola to ski, knowing in the back of your mind that you will have to reverse this process in a matter of hours) will create awkwardness at best and a strong disincentive to many at worst. There needs to be a better way to get people from where they live to the gondola terminal, including a regional transit system from across the SL Valley and potentially additional parking at the gondola itself. It's important for UDOT to understand that skiers and other mountain-lovers have a typically-irrational perspective on time/efficiency of access; "Powder Fever" is a real thing, and the prospect of using three modes of transit, taking at least 90 minutes, just to get to the ski area will be a strong dissuasion for many.

> Parking/traffic – a bottom terminal at the mouth of LCC will create the same traffic and congestion issues that prompted the closure of the existing parking lot to UTA bus service.

When coupled with buses trying to deliver people to the gondola and vehicles traveling up the canyon, could adding the gondola actually have a negative impact on travel?

> Timing – there was no discussion of the potential timing of gondola implementation beyond a generic goal of the 2050 plan. The problem is acute now and will only intensify over the next few years. The relative lengths of design/development/construction associated with the gondola vs the other options is important and should be part of an open and transparent process.

> Tourism – the concept of increased tourism value was discussed in the EIS; however, this was not identified in the Purpose and Need. The very thought that the gondola would be marketed as a tourist attraction seems contrary to the purpose of a gondola as it will put more pressure on its capacity, thereby leading to more traffic and congestion issues in the canyon. Additionally, this kind of marketing push flies in the face of the identified Purpose and Need in the EIS (which we think misses the mark as it does not consider the aforementioned need to do a capacity analysis).

In addition to the above comments, WBA firmly believes that any transportation solutions being considered must take a much wider view than the current EIS. The fact that Big Cottonwood Canyon is not being considered is a mistake given that what happens in one canyon will have a direct impact on use in the other. It also seems that other key stakeholders, including UTA, have not been consulted as part of the EIS, which would seem to pose immediate issues and risks with implementing any solution.

Wasatch Backcountry Alliance has formally been a part of the Mountain Accord and Central Wasatch Commission since the beginning of the former's process, and its board and members have been engaged in the community for decades prior to that. We understand the acute need and challenges associated with this process, and hope that our comments will be taken into due consideration to best help craft and create a solution that fits the current and future needs of the Salt Lake Valley residents and those people visiting the area who wish to explore and enjoy the beauty and majesty of the Central Wasatch.

#6031 - David Stein

Draft Alternatives and concerns:

Gondola – against.

- It would totally disturb the natural beauty of LCC.
- It would be dripping lubricants from all the towers (sheaves, just look on the snow under regular lift towers, VERY evident), each and every gondola (a 3S has two fixed cables that support and steady (against winds) the gondola) and the slack carriers have sheaves which drip lubricants. These lubricants will adversely affect water quality and this drinking water is VITAL for the Salt Lake Valley.
- The towers will be an environmental hazard in their construction phase (vehicles, erosion, disturbing of soils over both access roads, any temporary or permanent bridges needed over LCC Creek for all towers on the South side.
- The towers will also be a source of noise and visual pollution.
- It also would NOT provide either extended hours or four-season benefits.
- It also has both labor and operational expenses (especially power) during all hours of operation. These large O&M costs that would need to be shouldered by Utah taxpayers, for little benefit.
- It also provides no benefits to any LCC users except ski areas, anathema to the majority of Utah residents who don't ski in LCC.
- Since it is impossible to increase the throughput of a 3S gondola beyond its designed limit, it would also be a major expense for a permanent structure (destined to be a relic) that would only temporarily lessen traffic.
- It would also lead to many more buses permanently traversing Wasatch Boulevard leading to an inevitable decrease in quality of life and property values for residents near that road.
- The Gravel Pit Mobility Hub and "express" bus service to the gondola base station has MAJOR time estimate errors. UDOT assumed "articulated buses with a capacity of about 60 people per bus." Articulated buses do not have under-floor luggage storage bins like coach buses do. Where would 60 pairs of skis be stowed for the trip? How about 60-120 gear bags? They would either be all over the floor or occupying seats or both. What does this do to the time to load 60 people and all their gear? UDOT assumes 12 minutes from your car to being on the bus and ready for the bus to start moving. 12 minutes is hardly enough to find a parking space and get your gear out of your car (possibly out of a roof rack or aero-box). To say nothing of walking to the elevator (do you really think older folks or younger folks with lots of stuff or parents with kids and all that stuff will take the stairs?), waiting for the elevator, walking over to the counter, getting a ticket (if needed), then loading into a bus with gear all over the place, arguing with someone who put their gear on one of only seats left, trying to find seats together with your kids? Try at least 30 minutes, probably more like 45 minutes. Since the UDOT estimate of gondola travel time not including the bus portion is 51 minutes, this becomes 81-96 minutes. Since the UDOT estimate for traveling a personal vehicle up the canyon is 42 minutes you can

see why this will NOT be utilized by many people at all, except by (economic?) force which is odious.

See below for its inadequacy in meeting the Utah Central Wasatch Commission's (CWC) Staff Recommended Mountain Transportation System (MTS) Attributes and Objectives.

Enhanced Bus Service – against, especially the Snow Sheds (treated in a separate section since both Enhanced Bus Service alternatives include them). This applies to both “more buses” alternatives; with and without S.R. 210 widening.

- “More buses” has never worked long-range. As population and use increases, they become less and less effective.
- Diesel buses are slow, noisy, odious, and very inefficient when not filled to capacity. Their fuel is not sustainable. Their particulate emissions are hydrophobic and cannot act as snowflake nuclei, possibly adversely affecting snowfall. They add to air pollution, not as much as the autos they replace, but they do add to air pollution.
- They have major maintenance and fuel costs as well as replacement costs.
- They are not attractive. Have you ever ridden a ski bus? I did it once, yes ONCE back 30+ years ago. I would not recommend it except to experience how obnoxious it is.
- Two minutes to load a 60 passenger bus with all 60 people and all their ski gear?!? That is TOTALLY out of touch with reality. More like 30-45 minutes (see above).
- Where do these articulated buses turn around? It's tough enough for regular coach buses to navigate in the ski area parking lots. If more cornering room is needed, that would eliminate more of the parking spaces leading to more roadside parking.
- They are shut down during road closures and during avalanche control.
- They would not provide either extended hours or four-season benefits.
- No support to any LCC users except skiers, snowboarders, and some resort employees. Employees that need to be in before service starts or leave after service ends could not use the buses.

Snow Sheds – dead set against.

- Major environmental issues. Eliminate wildlife access to water (LCC Creek) for almost the entire length. Increased erosion. Drainage issues.
- Ugly, destroys scenic viewing of the canyon year-round for very little benefit (a few days a year of closures).
- Permanent damage to canyon. If a true solution is implemented the snow sheds will be an obsolete relic.
- Major negative impact on climbing and hiking access.
- Open-side columns are a safety hazard to vehicles and especially cyclists. I am a cyclist. The bike path outside the columns will almost never be used uphill and NEVER be used going downhill! Frequent concrete posts on one side, an unguarded drop-off on the other? After a VERY short time it will be coated with debris, sand and gravel, especially after a winter. How will

it be cleaned well enough to be safe to ride on? How often? What about broken glass, thorns, blown debris? Going downhill?!? A death trap. What unthoughtful non-cyclist thought this up? Take that portion of the bike path out of the design.

- The roadway shoulders under the show sheds will soon be littered with debris, especially towards the Jersey barrier protecting the columns from vehicles. No effective way to clean it. Cyclists will have to avoid it in order to avoid frequent flat tires and dangerous (or even deadly) falls. Is frequent street sweeping included in the O&M cost estimate? Not that I saw.
- The 4' overhang puts all the eroded sediment, debris and water right onto the bike path. Idiotic.
- Subject to landslide damage.
- Subject to extended closures if (when) avalanches or mudslides or landslides get into it. I have heard of weeks long closures. Murphy's Law says "if anything can go wrong, it will, and at the worst possible time". I think Murphy was an optimist.
- The earthen berm is idiotic and unrealistic in this scenario. To funnel an avalanche they need to be funnel shaped, so they cannot be vertical up the canyon wall or horizontal either. Imagine attempting to construct them on a steep, eroded hillside that is steep enough for avalanches. Impossible. They will be subjected to landslides, mudslides, and massive erosion. They would be a maintenance and environmental nightmare and enormous expense. Don't do them, we all will regret them!

S.R. 210 road widening – very much against.

- Will create very deep cuts into the hillside bank, creating erosion problems.
- Deep hillside cuts will affect climbing access over very long stretches of road.
- Deep hillside cuts will affect roadside climbing adversely.
- Deep cut and wider road increases the volume of avalanche material to be cleared, increasing expense and/or time to clear.
- Increases the scenic disruption greatly.
- Encourages more cars instead of reducing the auto traffic.
- Increases the impact on Little Cottonwood Creek as the road is already close to the creek in several places.
- Would encourage higher three-season traffic speeds, endangering cyclists more.

CWC Staff Recommended MTS Attributes and how Gondola (G), More Buses (B), and More Buses with widening (BW) satisfy each:

- G B BW Item
- Fail Fail Fail Environmental impacts are minimal and compatible with a sustainable environmental results
- Fail Fail Fail Reliability during all mountain conditions
- Fail Fail Fail Adequate frequency
- Fail Fail Fail Effect on the quality of recreational opportunities are protected"
- "• Poor Poor Poor Equitable Access (if fees charged, no three-season access)
- Okay Okay Okay Safety (G, B, BW close during avalanche control)

- Poor Poor Poor Efficient in moving people (low use still incurs almost same O&M cost)
- Poor Fail Fail Enhance experience for Central Wasatch Mountain visitors
- Fail Fail Fail Year-round access
- Fail Fail Fail Affordable/free transit (even if free to use, taxpayers pay)
- Fail Fail Fail Convenient
- Fail Fail Fail Quality of economic asset (only usable by skiers/boarders)
- Poor Poor Poor Reduces pollution (slightly, but not Renewable Energy powered)
- Fail Poor Poor Ability to move people to destinations (buses could stop for hikers/climbers)
- Fail Fail Fail Economical/Cost Effective (big tax burden for few beneficiaries)
- Fail Fail Fail Sensitivity to ridgelines (does not address BCC nor Park City access)

Objectives

- G B BW Item
- Poor Poor Poor Improve Transit
- Fail Fail Fail Disincentivize vehicles
- Fail Fail Fail Evaluate Carrying Capacity/Visitor Management
- Poor Fail Fail Incentivize transit
- Fail Fail Fail Assure year-round transit
- Fail Poor Poor Ensure trailhead access
- Fail Fail Fail Evaluate mix of private and public funding options
- Poor Fail Fail Achieve a sustainable result
- Fail Poor Poor Preserve wilderness characteristics in suitable areas
- n/a Poor Poor Improve bus experience short-term and long-term (not long-term)
- Fail Okay Okay Improve trailheads as part of transportation improvements
- Poor Poor Poor Reduce traffic congestion (temporary at best, ineffective at worst)
- Fail Fail Fail Improve ski-user amenities as part of MTS
- Fail Fail Fail Provide better ski resort connections
- Poor Poor Poor Increase transit use
- Fail Fail Fail Provide access for homeowners
- Poor Poor Fail Protect the environment
- Poor Poor Poor Assure protection of the watershed and water quality
- Poor Poor Poor Development around transit nodes (very limited nodes)
- Poor Poor Poor Use technology to optimize a MTS
- Fail Fail Fail Reduce or eliminate personal vehicles
- Fail Fail Fail Emergency egress
- n/a Poor Poor Improve bus traction/training short-term
- Poor Poor Poor Reduce fuels/wildfires
- Poor Poor Poor Reduce or continue to limit parking in the canyons
- Poor Poor Poor Improve communications to the public about traffic conditions
- Fail Fail Fail Accommodate current and increasing recreation demand
- Fail Fail Fail Consider both short-term solutions and long-term solutions (all short-term)
- Fail Okay Fail Protect visual quality of the Central Wasatch Mountains

#6053 - Tom Diegel

I wrote most of the Wasatch Backcountry Alliance comment so i will post that below. But i have a few more comments beyond that from my personal perspective:

1. I have been very disappointed that udot chose to exit the broader process; you missed The Opportunity to work closely with all stakeholders on a more comprehensive plan for the whole area. So it's hard for me to think that you have a broader picture in mind.

The fact that UDOT doesnt seem to have any interim solutions, ignores bcc and wasatch back issues as well, rejected other potential transit options such as rail, didn't work with any other stakeholders to identify potential a mobility hub closer to the mouth of LCC, and didn't work with UTA to clarify if they can even accommodate your ideas is indicative of the fact that UDOT is an unwilling partner when partnering is sorely needed. I am particularly annoyed that you aren't addressing summer use of your options, and no mention of tolling despite getting a mandate from the state to do so, which would provide funding as well as disincentivizing vehicles.

In short, I think UDOT clearly did a lot of work to get to this point, but there are huge holes and problems with the plan (and why is the comment box so small!)

The wasatch Backcountry Alliance comments (again, that I mostly wrote) are pasted below

In our comment regarding the original EIS Scope and Need process in May 2018, Wasatch Backcountry Alliance's comment began with this statement: "Wasatch Backcountry Alliance (WBA) envisions a low cost, low emission, energy efficient year-round multi-modal transportation scenario for improving the current traffic situation in Little Cottonwood Canyon (LCC). The system we envision must be capable of providing efficient and predictable service for travel to both developed locations (ski resorts) and to trailheads and other stopping points for dispersed use in LCC. Any improvements being made in LCC should be tied in to a larger transportation system that serves and benefits the entire Central Wasatch." To that end, with regard to the current LCC EIS, WBA supports enhanced busing with no widening of Highway 210.

WBA firmly believes that before any transportation system is selected, there must be a thorough analysis of the carrying capacity of Little Cottonwood Canyon. This will help establish the volume of people that need to be moved up and down the canyon, which will invariably help determine which transportation system best fits that purpose and need. WBA strongly encourages UDOT to work with other stakeholders, including the US Forest Service and Salt Lake County, to undertake a carrying capacity analysis and to make that part of the current EIS.

With regards to the two options that use more buses (extended bus service and widening of the LCC road to accommodate yet-more buses), WBA continues to support the same concept that we stated in our May 2018 Scope and Need comment: "The transportation system should use the best currently available technology to serve all user groups on a year-round basis. WBA

believes that the best currently available technology that meets our criteria is a flexible and dynamic fleet of energy efficient buses and vans using a series of transportation hubs.” At this point in time, we do not think that Highway 210 should be widened to accommodate more vehicles, but that having dedicated times for buses and cars with 4 people (ie. 7-9am and 3-5pm) should be more thoroughly explored.

The most-recent EIS document clearly reflects a lot of work done on the part of UDOT, but it also generates many questions and we feel there are some important fundamental flaws that should be addressed. To that point, we have some comments about what we regard as key issues with this EIS:

The current EIS does not address the concept of multiple Mobility Hubs other than the one on 9400 South and the one at the Gravel Pit. WBA thinks that the transit system needs to originate at locations around the valley (ie. U of U/Foothill, downtown, airport, WVC, Draper, West Jordan and points farther south, etc.) so that people can access the bus where they live, rather than drive their car to a mobility hub to catch the bus. When faced with this choice, we suspect many people will choose to remain in their cars rather than use the bus.

There is very little discussion of the needs of non-ski resort, dispersed users (in particular with regards to the White Pine trailhead, which has already increased in use to the point where it's dangerous due to on-highway parking in both summer and winter).

We do not see any financial life cycle analysis (capital and operation, maintenance) of any of the options presented over the projected timeframe. Given that the least-expensive option will come at a cost of ~\$100 for every single Utahn, this is relevant).

There is no mention of any interim solutions, and according to a UDOT spokesperson, UDOT has “no idea” what to do in the interim, nor are there any approximate timelines to actually identify what the “interim” is. LCC is facing an acute problem now that will only worsen, and the lack of timelines is a major missing component of the EIS.

There is only token consideration given to the effects of each of the options on the vital LCC watershed, either by construction or ongoing use.

There is very little/no mention of tolling on vehicles, though it is our understanding that the Utah state legislature specifically allocated considerable monies to UDOT to consider tolling, and as noted above, the Wasatch Backcountry Alliance is a proponent of tolling.

The EIS provides no rationale for UDOT's winnowing of 35 different options to these three.

Based on our review of the EIS, the focus of the document and the tone of the online meetings on June 23-24, despite there being three alternatives in the EIS, it seems that the gondola option is being pushed as the preferred option. While we recognize that there may be potential benefits of a gondola operation, there are important components of it that we take issue with:

Volume – the gondola as proposed will only carry about 1/3 of those people heading up LCC. This means that 2/3 will still be on the LCC road, so how does installing a gondola at cost of ~\$400M make any sense if it will not help alleviate the traffic issue currently plaguing LCC and the surrounding Sandy and Cottonwood Heights communities?

Summer use - We understand that an important need of the EIS is to address the peak use times during the winter. However, traffic (and parking) in LCC is an issue year-round, and traffic-related issues are not limited to peak/storm periods. Summertime traffic as it relates to bicyclists needs to be addressed, particularly in the early fall when Snowbird's two-month long "Oktoberfest" is in full swing, given that event has a large focus on drinking alcohol at the top of a steep windy canyon.

Schedule – Backcountry enthusiasts, employees, and contractors travel the canyon at all hours. Scheduling gondola availability for only the peak skiing hours transforms it from a transportation solution to a taxpayer-paid ski lift that benefits two private companies that operate largely on public land.

Fees – there was no mention of the potential costs to riders. If fees are prohibitive, the system won't be utilized. Given the vast majority of people riding a gondola will be going to the ski areas, will the ski areas supplement/offset the cost of the gondola as they currently do with the bus?

Roadway use – will vehicles driving up the canyon be tolled? The state legislature allocated a lot of taxpayer dollars towards the concept of tolling, and creating financial disincentives to drive up the canyon and use the gondola (or any transit system) is imperative. This could also include paid parking in all of upper LCC (ie. starting at Snowbird Entry 1).

While fees and schedules could easily be considered TBD details and perhaps that is why they were not included, the gondola's schedule and fees are essential components to its success.

Highway 210 improvements – there was no mention of improvements to Hwy 210 in addition to the gondola. For service vehicles, delivery trucks, residents, emergency vehicles, and those who don't use the gondola, the threats that the canyon represents will still exist. For example, if the gondola is chosen, will any improvements be made to Hwy 210, ie. snowsheds?

UTA buses – there was no mention of bus service; again, perhaps a TBD detail, but given the continued growth in use, there is no doubt that bus service will be an important component as well even if the gondola is chosen given that a majority of people will still be traveling up LCC on the road.

Convenience of travel – the three-step process for getting up the canyon using the gondola (drive your car to one of two intermodal hubs, put on your ski gear (plus potentially help your kids with their gear) to get on a bus, get off the bus to get on the gondola, and finally get off the gondola to ski, knowing in the back of your mind that you will have to reverse this process in a matter of hours) will create awkwardness at best and a strong disincentive to many at worst.

There needs to be a better way to get people from where they live to the gondola terminal, including a regional transit system from across the SL Valley and potentially additional parking at the gondola itself. It's important for UDOT to understand that skiers and other mountain-lovers have a typically-irrational perspective on time/efficiency of access; "Powder Fever" is a real thing, and the prospect of using three modes of transit, taking at least 90 minutes, just to get to the ski area will be a strong dissuasion for many.

Parking/traffic – a bottom terminal at the mouth of LCC will create the same traffic and congestion issues that prompted the closure of the existing parking lot to UTA bus service.

When coupled with buses trying to deliver people to the gondola and vehicles traveling up the canyon, could adding the gondola actually have a negative impact on travel?

Timing – there was no discussion of the potential timing of gondola implementation beyond a generic goal of the 2050 plan. The problem is acute now and will only intensify over the next few years. The relative lengths of design/development/construction associated with the gondola vs the other options is important and should be part of an open and transparent process.

Tourism – the concept of increased tourism value was discussed in the EIS; however, this was not identified in the Purpose and Need. The very thought that the gondola would be marketed as a tourist attraction seems contrary to the purpose of a gondola as it will put more pressure on its capacity, thereby leading to more traffic and congestion issues in the canyon. Additionally, this kind of marketing push flies in the face of the identified Purpose and Need in the EIS (which we think misses the mark as it does not consider the aforementioned need to do a capacity analysis).

In addition to the above comments, WBA firmly believes that any transportation solutions being considered must take a much wider view than the current EIS. The fact that Big Cottonwood Canyon is not being considered is a mistake given that what happens in one canyon will have a direct impact on use in the other. It also seems that other key stakeholders, including UTA, have not been consulted as part of the EIS, which would seem to pose immediate issues and risks with implementing any solution.

Wasatch Backcountry Alliance has formally been a part of the Mountain Accord and Central Wasatch Commission since the beginning of the former's process, and its board and members have been engaged in the community for decades prior to that. We understand the acute need and challenges associated with this process, and hope that our comments will be taken into due consideration to best help craft and create a solution that fits the current and future needs of the Salt Lake Valley residents and those people visiting the area who wish to explore and enjoy the beauty and majesty of the Central Wasatch.

#6084 - Matt Sibul

July 10, 2020

Comments on Little Cottonwood Canyon (LCC) Environmental Impact Statement (EIS)
SR 210 – Wasatch Boulevard to Alta
Alternatives Report, June 8, 2020
Utah Department of Transportation (UDOT)

By Matt Sibul: resident, engineer, and canyon enthusiast

Big Picture, High Level Comments

1. From a process perspective, UDOT has done a great job to get public feedback on the alternatives that will eventually go into the Draft EIS, due out next Spring (2021).
2. UDOT should not have eliminated the cog rail train from the alternatives report as a part of their EIS Alternatives Report. It was a fundamentally flawed analysis and needs to be re-visited.
3. The train is best overall long term, year-round and cost-effective solution.
4. The report is biased and does not have the Cog Railway on a level playing field with the other alternatives.
5. UDOT and their consultants chose one of the most expensive rail design options while grossly exaggerating the capital cost estimates and compared it to the simplest configuration and cheapest gondola solution.
6. It is not too late for UDOT to revise the alternatives that will go into the Draft EIS.
7. The lack of a level playing field in which the alternatives have been developed and analyzed to date would undermine the “tried and true” NEPA process and could be grounds for an environmental challenge.
8. It is bad public policy and completely absurd for the alternatives to be evaluated and presumed to only be operating during winter months. Any of the alternatives involve a large level of cost, and they should be utilized year-round.
9. The gondola is primarily a ski resort chair lift. There would be no ability for passengers to access hiking trailheads or backcountry ski entry points. Yes the ski industry is important to the economy of Utah, but this seems like an over-reaching public subsidy to private industry.

10. Not only should the Alternatives section of the EIS be re-evaluated, but the project's purpose and need is inadequate. Why would there not be a component of regional connectivity to the rest of the transit system? A gondola is a completely new and awkward form of transportation that has no nexus to the existing rail system along the Wasatch Front. A lot of thoughtful and strategic work has happened over the past 20 years by UTA and UDOT; this LCC EIS completely throws this out the window.

Specific Technical Comments

1. A life cycle cost analysis is the best tool to compare a diverse set of modes and should have been prepared.

2. The alternatives are not equally addressed and evaluated. The report is clearly biased towards making some alternatives look better than others. In order for alternatives to be fairly compared, they need to have a similar basis. You cannot compare a rail line from 9400 S. and 2000 E (with urban traffic and residential/business issues) with a gondola at the base of Little Cottonwood Canyon fed by buses from 7200 S. and Wasatch Boulevard.

3. A 9-mile Cog Railway is being completely rebuilt in Pike's Peak, Colorado for a total cost of \$110 million or \$12 million per mile. This report uses \$138-\$169 million per mile.

4. A train can be built with minimal construction impacts as seen by the real-world experience in constructing the Pike's Peak Railway.

5. A train is the most environmentally friendly for air quality, watershed quality, energy consumption, congestion relief, economic development, land use management, pedestrian compatibility, and visual aesthetics, and is the most consistent with the Canyon's core values. The impacts to our wilderness areas and boundaries are unclear.

6. A Cog train has the highest potential carrying capacity of all the modes and can easily be adjusted for peak vs off peak demand, and it can service intermediate stops. A gondola does not have this ability.

7. The report suggests a gondola every 25 seconds or a bus every 2.5 minutes or a train every 15 minutes. In the canyon, in both directions, this means a gondola every few hundred feet or a bus every quarter mile. Imagine the visual aesthetic impact of these alternative versus that of two trains every hour.

8. Although a massive park and ride lot for 2500 cars is recommended for LCC needs, the report ignores the parking needs and requirements for BCC. Stalls for up 5000 cars might be necessary for both canyons and all users.

9. Evacuating passengers from gondola cabins is extremely dangerous, especially in inclement weather.

10. Most major capital transit investments require a long-range travel forecast. The analysis picks a 2050 horizon year but makes no assessment of what the needs are. Additionally, in one place, it refers to a 2050 auto count which only represents a 1% growth rate per year. This has NEVER happened in Utah since we started keeping traffic counts. Typically, in Utah, we have had a 2% population growth rate and a 5-6% increase in traffic annually. Any forecasts that suggests a 1% growth rate are suspect and could be challenged.

11. The only fair comparison between modes is Life Cycle Costs. Especially when the horizon year is 2050. Why wasn't this done? It is standard industry practice. In this time period a bus would need to be replaced 3 times whereas a train is able to last much longer. Many rail systems are 50+ years old. Additionally, the biggest costs in transit is the cost of labor. A bus carries 42 passengers with 1 operator, a train carries 240 passengers with 1 operator. Typically, the costs for operations and maintenance are greater in a 30-year time frame than the initial capital costs. The failure to address Life Cycle Costs seems to be a systemic failure of the report and it questions the validity of the entire report.

12. The report poorly and myopically addresses the purpose and need. For example, it only refers winter service. But this is not in the purpose and need. The 30th highest traffic count may work for highway design but is not relevant for transit planning. As another example, the purpose and need talks about safety but the only real measurement they use is the protection from avalanches. It's possible that this was written when UDOT was just looking for short term solutions and not sufficiently thought through for larger capital expenditures. This appears to be a major process weakness and could be subject to a legal challenge

13. An appropriate and fair EIS would provide similar alternative scenarios to compare. A gondola from the bottom of LCC with a feeder bus is not comparable to a rail alternative from the middle of the valley in an exclusive corridor up LCC. Clearly the residential impacts of rail in the 'city' are significant. The report should have used the same feeder bus alternative as the gondola. Additionally, the author placed the Rail alternative in an exclusive alignment when it clearly could have been placed in the same location of the bus-only lane. These biased, unbalanced and unequal comparisons raise serious questions.

14. The protection from avalanches is not the only safety factor to be considered. The report Does Not consider the safety of riding in a particular more. Why was this? It is a standard level of professionalism that was not applied.

15. A big advantage of railways is its adaptability to fit into any built environment. Historically, the road in the upper parts of the canyon are built on top of the LCC railway that was constructed and operated over 100 years ago.

16. The Pikes Peak Cog Railway in Colorado is being built for \$110 M or \$12 million per mile. It has many of the same characteristics that are applicable to LCC. There are many examples and lessons learned that Utah should apply to this analysis.

17. A Cog rail can be constructed adjacent to the roadway with state-of-the-art construction that minimizes impacts and costs. A Cog railway can be built as a diesel system and converted to electric in another phase.

18. There is no forecast for future use. This is unprincipled. The report just simply tries to compare modes to match a certain hourly capacity. Major capital transit Investments require knowing what your build-out future year ridership is.

19. The report does not respond to its own purpose and need. This is a typical Achilles heel for EISs. For example, the report should have evaluated all the safety factors that might impact the Little Cottonwood Corridor, yet the only safety criterion it evaluates is protection from avalanches. Although this is an important feature, the report totally disregards the larger safety picture. An evaluation of the safety of driving on the road is completely missing as is a comparison of safety between transit modes. As another example, there is no discussion of the safety aspects of evacuating patrons from a disabled gondola between towers. Additionally, the report does an inadequate job of addressing congestion relief. It does not address the impact of those cars and buses coming to a base lot and feeding a gondola. The report mentions a 2,500-car parking lot would be needed at the mouth of BCC. It ignores the travel issues in BCC and fails to point out that additional stalls would be required for BCC . External travel trips are typically included in EISs. This would bring this parking lot total closer to double its recommended size (potentially 5,000 cars!).

20. The report appears to ignore an overwhelming number of comments that support including rail as an alternative. This reflects a clear bias of the report.

21. Many of the transit costs and issues are incorrect or all together ignored. A typical problem with transit is deadhead time and costs. The public hates seeing empty buses. The report fails to address the massive expense of taking a large fleet of buses from a central garage and deadheading them throughout the day. It uses NTD data base for bus operating costs which reflect the cost of running buses in the city. It is NOT the same as running in the canyons.

22. Most striking is the discussion on frequencies. The report refers to a train running every 15 minutes, a bus running every 2 ½ minutes (or 1 ¼ minutes in both directions) and a gondola every 25 seconds (or virtually a string of gondola cars in both directions). This suggests that at any one point in time, there would be either 3 trains or 48 buses or 120 gondola cabins. This translates to a gondola cabin every 800 feet (or 400 feet in both directions) from end of the canyon to the other. The report ignores these visual impacts.

23. The report's cost estimates for rail are wildly inflated. Contemporary estimates are about \$58 million per mile and Pikes Peak COG Railway in Colorado is being built for far less -\$12 million per mile. This is substantially less than the report's estimate of \$138-\$169 million per mile. Additionally, while the overhead costs for the gondola are only 10%, the report uses a whopping 47% increase in costs for overhead on the rail. This is hundreds of millions of dollars in unnecessary costs.

#6100 - Craig Osterloh

The following is the response to the UDOT Little Cottonwood Canyon EIS Draft Transportation Alternatives. The response is from 27 members of the Little Cottonwood Canyon community, which is the area east of Wasatch Blvd between SR-210 and SR-209.

Little Cottonwood Canyon Community Response to the

UDOT Little Cottonwood Canyon EIS

After evaluating the three alternatives presented by UDOT for comment in the Little Cottonwood EIS, we believe option 1 is the best alternative because it makes the least impact on the canyon with an average, but reasonable transit time. Although the transit time for Alternative 2- Enhanced Bus with road widening would reduce travel time for both bus and car passengers, the impact to the canyon by widening the road should not be justified for this reduction.

UDOT Alternative 1 and Alternative 2

These two alternatives provide advantages over alternative 3:

They are scalable solutions where service can be increased or decreased depending on demand. Also, Alternative 1 is scalable to Alternative 2 if we later find it is insufficient. (Note that under either alternative, the snow sheds should be built to handle road widening in case that becomes necessary.)

They provide the possibility to serve other canyon destinations in the summer, not just Alta and Snowbird.

The use of selectively placed avalanche sheds will have a positive impact on reducing road closures and snow removal time in those areas deemed to provide the greatest benefit.

Bus routes originating from the north and from the south create the most direct/efficient routes to the ski areas. In addition this alternative provides express buses minimizing the number of enroute stops and avoids the two Snowbird stops for riders continuing on to Alta.

The Central Wasatch Commission has discussed the inclusion of disincentives for continued private vehicle use such as variable tolling. These tools should be used to support increased public transit or high occupancy use.

These options are both faster than alternative 3.

We believe alternative 1 is preferred as it can achieve 80% of the gain with less impact to the canyon, than #2, provided that disincentives to private vehicle use are employed.

UDOT Alternative 3 — Gondola

Other than creating a very sexy travel brochure for two ski areas this option provides little value for the majority of riders, local residents and taxpayers.

The transit time of 63 minutes for Alternative 3 takes too long and will not motivate people to get out of their cars and take public transit. For people coming from the south, this calculation does not include the additional car travel time to drive north past the mouth of LCC to the mobility hub to then backtrack to the gondola. This will be a tough sell to local skiers.

Alternative 3 presents a false choice. By removing the Snow Sheds and the 94th South Mobility Hub, it shows a false cost savings. These items are necessary and we believe will eventually be included. They should be included to make a fair financial comparison.

The exclusion of avalanche sheds for the proposal should make this option a nonstarter. The 70% of remaining car traffic (per UDOT assumptions) will be subject to the same road clearing delays creating the same gridlock for neighborhoods as the present state. UDOT clearly stated that the exclusion of the shed for this alternative was done to make the cost comparison to the other options more attractive.

The gondola serves just 2 fixed destinations in the canyon. Hikers will still be driving cars to the various trailheads when the ski season wanes. The gondola will do little to reduce vehicle use year round as has been an objective of Mountain Accord and the CWC.

UDOT's vision for the gondola station is that kiss and ride traffic, or riders who otherwise did not originate at the mobility hub, would be prohibited access to the station. We have little faith that such a restriction can or would be maintained going forward. We believe that the gondola proposal is the proverbial "camel's nose in the tent". Regardless of how well intentioned UDOT and the political powers are, eventually, the political will to prevent "kiss and rides" and parking at the gondola will fail. This will result in new drop off zones, expanded parking structures, and continued worsening congestion at the canyon mouth, and beyond. We believe that this could result in delays far worse than they are today.

Carrying Capacity and Other Issues

The additional critical points regarding the future of LCC are related to but not directly tied to the UDOT EIS.

Canyon Carrying Capacity

When making changes to an existing current state there are desired outcomes and often undesired outcomes that can be anticipated or unanticipated. What do we want the canyon experience to be and how will any related decision impact that vision?

Two key published drivers of UDOT's project are safety and reducing/eliminating traffic log jams/delays occurring on powder days. To what degree does a specific transportation choice introduce perhaps an unpublished objective: increase the number of visitors to the canyon?

Snowbird and Alta have made public their belief that when their parking lots are full there is still plenty of capacity on the slopes for additional skiers. The comparative density standard they are applying is that of the ski experience found at California resorts which is greater than normally enjoyed here. The Forest Service leaves the management of the skier experience up to the respective resorts.

Currently canyon visitor occupancy is indirectly controlled by the limited parking at the resorts, trailhead parking lots and whatever off highway space drivers can find. In many ways LCC's transportation challenges have helped slow use demand relative to an increasing population.

The Forest Service also takes no position regarding the capacity of visitors during the summer. They employ strategies to mitigate the impact of increasing numbers: closing areas that have become "worn out", harden trails (asphalt), increase parking lot size, install toilets, etc. What they won't do is promote discussion with the general public on what is the desired experience of visitors to the non commercialized canyon sites. When does an increase in volume of visitors degrade the outdoor experience?

Over the years both BCC and LCC have gone through incremental change without the benefit of a formalized carrying capacity study: how much activity can the canyons handle? You can put a lot of skiers on 10' of snow without necessarily degrading the ecology. Summer visitation is different. At some point nature cannot accommodate an increase in users.

Mountain Accord went through its process and made their recommendations without conducting a capacity study. The CWC has agreed a study should be done not only on how capacity impacts the ecology but also on how capacity impacts the subjective experience of the visitor. However, the Commission is requiring any CWC study to be done simultaneously with other CWC initiatives that are part of its charter. And yet here we are considering transportation options, without the benefit of a consensus on the canyon carrying capacity, that may have both anticipated and unanticipated consequences.

Sometimes it feels that we are expecting more out of these canyons than they can deliver based on their ecology, small size and importance to valley water supply. They are unique and special places.

A carrying capacity study that includes a visitor's desired experience component needs to guide decisions regarding LCC.

Socializing cost, privatizing profits

The gondola solution requires major capital dollars for permanent transportation infrastructure to be built, operated and maintained in LCC. While safety and traffic flow are the primary concerns driving the initiative the proposed transportation system serves and solely benefits two private businesses. If this solution is selected it would be appropriate that the two private businesses solely benefitting from this public project make a significant contribution to the cost of the installation and its ongoing operating costs (beyond just providing passes for employees and season passholders).

Growth and development confronts "life elevated"

The phase "life elevated" appears over a scenic Utah back drop. We market and sell this untouched natural beauty to attract business and development. Yet it seems like development and growth reigns supreme in this state. At some point in time this strategy runs smack into the image of scenic Utah and brings diminished returns.

Several years ago both Mountain Accord (MA) and Envision Utah projected massive increases in regional population over the next 20 years. As part of their argument for change MA inferred that all the demand for recreational activity from this growth would be channeled to BCC and LCC. We just needed to figure out how to put all that increased demand into the existing recreational "container". Perhaps a better solution for Utah would be to find or develop additional outdoor recreational options: create new campgrounds, hiking trails and reservoirs to handle increased demand.

Yosemite has a reservation and lottery system to climb Half Dome via its cable system. Zions prohibits personal cars and is considering a reservation system for park entrance. The Wave trail in southern Utah requires reservations. Finite fragile resources require changes in how we share and use them.

The nature of small box canyons with vertical walls in a watershed area does not present the same development opportunity as does the open space that surrounds places like Park City, Vail, Beaver Creek, and Whistler Mountain. Yet MA had members who advocated a cog train along 9400 south and up LCC (which UDOT appropriately determined unfeasible for several reasons). In contrast, Jackson Hole has done a nice job limiting development sprawl at the base of their mountain and in providing bus service from town.

#6235 - Nicholas Gibbs

Nicholas Gibbs
July 10, 2020

Utah Department of Transportation, Et. Al.
Re: Little Cottonwood Canyon EIS 2018

Identity of Commenter and an Observation

I am 61 years old and a home owner in the Town of Alta. Before building our current home in 1977 my father, Peter Gibbs along with his brothers Edwin and Bill and their sister Mary Adele built the Peruvian Lodge and opened for guests in 1948. My family owned and operated the Peruvian Lodge until shortly before we built our current home in the town of Alta. I have spent my entire life driving up and down Little Cottonwood Canyon. Presently, I drive up and down Little Cottonwood Canyon very frequently, as do my wife and sons. I am an Alta season ski pass holder as are my wife and sons and I am intimately familiar with the traffic situation in the canyon year round.

I believe that the existing road in Little Cottonwood Canyon is adequate 98% of the time. In fact it is significantly better than when I was a boy and through my 20's. I find it extremely uncommon to have major traffic jams in the canyon itself. Once in the Canyon the traffic seems to flow. Improving Wasatch Blvd and North Little Cottonwood Canyon Road so that busses can get ahead of any car traffic jams on Wasatch Blvd is vitally needed. Improving Wasatch Blvd is critical regardless of which of the three outlined options is selected.

I do not support additional lanes in Little Cottonwood Canyon. While I believe that it is essential to give the busses some means to pass vehicles on Wasatch Blvd, I question the need of dedicated bus lanes in the Canyon. While the canyon road may be near its limit on the very few busiest days, it is adequate without substantial improvements if steps are taken that reduce the number of cars in the canyon.

Below are 11 specific comments.

Comment 1: The solution is more people in fewer vehicles. This includes more people using the bus system and incentivizing high occupancy in private vehicles.

With respect to buses you can incentivize people to use them by a having a bus service that is frequent, reliable and inexpensive. Reliable service includes service that can bypass the worst of the traffic jams on Wasatch and North Little Cottonwood Road and get to the head of the line at the mouth of Little Cottonwood Canyon. Inexpensive is a relative term, and bus service needs to be inexpensive compared to other options. One means of making this occur is to put a price on driving private cars.

The occupancy of cars can be increased by putting a toll on those who drive up the canyon. This also makes the bus look more attractive. A toll system should be automated like EZPass on the East Coast.

Occupancy of cars will also increase if cars that are not carpools must pay to park. The pay-to-park scheme adopted by Solitude resort last year should in some form be adopted by Alta and Snowbird. There may be other means to get more people in fewer vehicles that should be explored. A "Busses Only" rule in effect for the first few hours of each day would reduce the number of cars. Please note that all of these steps, except building another lane or a bus lane between the mouth of Big Cottonwood and the mouth of Little Cottonwood, are very inexpensive compared to the options outlined in the EIS.

Only after these steps have been taken and have been found to be wanting should UDOT consider an enhanced bus lane in the Canyon or an aerial tramway. Go for the low hanging fruit first before expensive "fixes" that may not be necessary if better bus service, tolling, charging for non-carpool parking and the like do not solve the problem.

Comment 2: Stage some of the improvement and be flexible. UDOT should make some of the improvement before others. For example, UDOT could improve Wasatch Blvd and North Little Cottonwood Road, implement tolling and/or fees based parking, then wait and see how much the traffic is reduced. UDOT can then analyze how well the improved system works before the massive expenditures on other options such as the aerial tram or additional lanes in the Canyon.

Comment 3: The goal of getting 30% of the cars off the road by 2050 is far too low. This is an absurdly low goal in light of the amount of the proposed expenditures under any of the options.

The tools discussed above could get 30% or more cars off the road in short order. These include 1) reliable, frequent and inexpensive bus service 2) bus service that can bypass any traffic jam on Wasatch Blvd. and North Little Cottonwood Road, 3) tolls so that there is a cost to taking an automobile up the canyon, and 4) fees to park at the resorts if the car is not a carpool (as Solitude resort implemented last year). Some combination of the use of these tools could significantly reduce the number of vehicles in the canyon. As a boy and young man I rode the bus every weekend to and from Alta. It was a round trip from the Olympus Hills Shopping Mall to the Gold Miner's daughter and it was cheap, convenient and easy.

Comment 4: Intermodal hubs and parking structures are a crucial step to get more people out of their cars and into busses. In addition to the two planned hubs, consider (re)purchasing the large no-man's-land between Olympus Hills Mall and I-215 and adding 39th south to the possible parking areas. The existing park and ride at 39th south for UTA could be expanded if UDOT (or the County?) staging area for snow plows were moved and the park and ride tripled in size.

Comment 5: Expansion of Wasatch Blvd and North Little Cottonwood Road. The residents in this area are concerned about this corridor becoming a highway and are urging that it be kept as a two lane “street” and not be a road. Efforts to accommodate the residents in this area should be made, but it is absolutely essential that at a minimum a south bound bus lane be constructed. The SaveNotPay group seems to recognize this in their literature. To reduce the “highway feel” in this area consider lowering the speed limit on North Little Cottonwood Road from 50 to 40 mph. It is already 40 in the Canyon and 40 as northbound cars approach Wasatch. Make it consistent. And while taking what action you can to appease the people who have chosen to live by the road to the ski resorts, expand Wasatch Blvd and North Little Cottonwood Road.

Comment 6: Snow sheds do not appear to be worth it. An expenditure in the range of \$100 million dollars for snow sheds increases the likelihood that skiers will have better access to the ski resorts for about 5 days each year. Even that is no guarantee. Some years there are no major avalanches so the sheds are not needed. Other years the slides are plentiful, but the snow sheds do not guarantee that there will be resort access. In the 2019/2020 winter the sheds as outlined in the EIS would have protected the road from only 40% of the slides, so resort access would still have been reduced for 2 or 3 days anyway.

Comment 7: The EIS fails to adequately evaluate or consider the impact of charging a toll to drive up the canyon. If a goal of the project is to reduce the number of cars in the canyon, tolling is a very important tool that should be implemented. Tolling is one of the factors that makes the bus seem like a better deal. The EIS should not gloss over this option but include realistic plans to implement tolls including an automated system like EZPass on the East Coast.

Comment 8: Charging for parking. The EIS does not adequately consider how charging for parking would reduce the number of cars in the canyon. Charging for parking tends to incentivize people to use the bus and incentivize car pooling. While it is true that the parking lots at the ski resorts are not under the control of UDOT, UDOT could work with the resorts to implement fee based parking.

Comment 9: UDOT must consider the impact of traffic regulations as part of the EIS. Traffic regulations are a means of solving some of the congestion problems and need to be considered in the EIS in addition to the focus on building infrastructure. The issue of road side parking can be used to illustrate this point.

The EIS calls for expansion of the White Pine parking lot to reduce the number of cars parked along the side of the road in Little Cottonwood Canyon. UDOT says roadside parking creates a danger year round and in addition in the wintertime it hampers snow removal.

It is questionable whether a parking lot could be constructed that would meet peak demand for the popular hiking and backcountry trailhead at White Pine. It is an environmentally sensitive so the size of the parking lot has to be weighed against environmental consideration. Let's assume

UDOT gets approval to build the largest parking lot set forth in the EIS. What happens if this expanded parking lot does not meet peak demand? The options are to prohibit roadside parking and have the parking lot be first come first serve, so some folks would find that they need to abort their planned adventure up White Pine when they arrive too late to find a parking stall. Another option is to continue to allow road side parking in the summer months for overflow demand. Better yet, during warmer months have the bus service stop at White Pine Trail Head and Lisa Falls.

Continuing to allow roadside parking, which is a matter of traffic regulation, may be the best option, regardless of whether or not the White Pine trailhead parking lot is expanded. The speed limit in this area (traffic regulation) could be reduced. The limit is currently 40 mph but the area is just several hundred yards from the point before Snowbird where the speed limit on 210 is 30 mph for the balance of the road to Alta, where it drops to 25 mph.

This area with roadside parking could also be managed something like a school zone and have flashing signs that reduce the speed limit to 25 mph on those summer weekend days when everyone seems to want to go White Pine. That would be a better solution than banning road side parking.

Does UDOT propose to treat Snowbird's Octoberfest the same way it treats backcountry enthusiasts using the White Pine trail head? Currently for roughly six weekends each fall roadside parking is permitted along the entirety of Little Cottonwood Canyon Road in the Snowbird Area, and it is often full to capacity. Road side parking is also permitted there during the ski season. If UDOT bans roadside parking at White Pine it seems logical that it must ban it also near Snowbird, possibly in both winter and summer.

A better solution is not to ban roadside parking in its entirety but manage any safety concerns through traffic regulations and enforcement, and these should be addressed in the EIS. Allow roadside parking near White Pine when the parking lot is full. Deal with the safety issue by treating the area like a school zone and significantly lower the speed limit at certain times. Similarly, permit roadside parking at Alta and Snowbird. Deal with any safety concerns this creates through traffic regulations and enforcement.

While I have long thought that road side parking was preferable to paving national forest lands with parking lots, I am impressed with the recently constructed parking lot at Rattlesnake Gulch in Millcreek Canyon and recognize some expansion of the parking lot at White Pine is inevitable.

Comment 10: The aerial tram is a dubious solution with multiple drawbacks. The Tram is very expensive when compared to other options. This is especially true if we accept that a few days each year without access to the resorts by car due to avalanches, which inconvenient, does not mean that a \$100 million investment in snow sheds is worth it. Without snow sheds on the road

the Tram is by far the most expensive option. Since the problem can be solved by the much less expensive steps outlined elsewhere in these comments, the expensive tram option should be discarded.

The Tram serves only the resorts. It does not solve any other canyon transportation uses. The Tram would take longer than cars, especially since access to the tram is likely only by bus. Why would someone get out of their car and take a bus, then transfer to the tram, when could stay either in their car or on the bus and get to the resorts faster? Consequently the use of the tram by skiers is unknown. It may assist getting skiers to the resorts on a few snowing days but otherwise is a dubious proposition. While one can imagine a few days each year where the roadway is jammed up and a few happy skier bypass the traffic by getting to the tram, overall this expensive option is little more than a Disney ride. UDOT needs to focus on solving the transportation problem, not building an amusement park ride.

Comment 11: This whole process may be flawed because there has not been a study to determine the ecological limits of humans in the Canyon, also referred to as the "carrying capacity." The EIS seems to presuppose no limits. Considering determining these limits before building more infrastructure.

Respectfully,

Nicholas Gibbs

#6254 - Gregory and Karen Heath

Preliminary Observations:

Use of Little Cottonwood Canyon (LCC) is not going to go down in future years—which the draft EIS acknowledges. As the population of the State continues to increase, and as travel here from elsewhere continues to increase for skiing as well as other outdoor activities in all seasons, use of the canyon will continue to increase.

There is a practical limit to how many vehicles can be accommodated at the top of LCC, and we are approaching (and perhaps at times exceed) that limit now. Over the medium and long term, it is imperative to find an effective alternative to a large share of the private vehicle use during high-demand time periods and to preserve the canyon as much as possible.

1. Widening Wasatch Boulevard to four lanes between Bengal Boulevard and Little Cottonwood Canyon Road

Widening Wasatch Boulevard from two lanes to four lanes between Bengal Blvd. and the “T” intersection where Wasatch separates from North Little Cottonwood Road will, by itself, do nothing to solve any traffic problem, whether in the canyon or on Wasatch Blvd. As it is now, the two lanes coming south from Fort Union merge into one southbound lane just south of the light at Bengal Blvd. On heavy ski use days, particularly weekend and holiday and other heavy skiing days, a traffic jam from that merge point will extend back on Wasatch much of the way to the light at 6200 South. The one-lane traffic then crawls the rest of the way on Wasatch and onto North Little Cottonwood Canyon Road, and thence up the canyon.

The only effect of widening Wasatch to four lanes (two southbound) from the light at Bengal to the intersection with North Little Cottonwood Canyon Road would be to move the location of the point where two southbound lanes merge into one lane, which causes the initial traffic jam, south about 13 blocks or so to the North Little Cottonwood Canyon Road intersection. Then on the heavy use days there would be two lanes of jammed southbound traffic along Wasatch from that point extending back north instead of one lane of jammed traffic. There would be no effect on the one-lane congestion or jam from that point up into the canyon.

Nor would widening that portion of Wasatch have any significant positive effect on commuter traffic—again for the reason that Wasatch Boulevard south of the intersection with North Little Cottonwood Canyon Road is only one lane each way. For the southbound traffic during evening rush hour, the two southbound lanes would have to merge into one southbound lane at that intersection. Virtually all the evening commuter traffic turns right at that intersection to continue south on Wasatch. Northbound traffic south of the intersection during morning rush hour would still be one lane up to the intersection, and the additional northbound lane between the intersection and Bengal Blvd. (where the road widens to two lanes now) would make little

difference. The scope of the project doesn't even address Wasatch Boulevard south of the North Little Cottonwood Road intersection.

There is no proposal on the table or in the report to widen North Little Cottonwood Canyon from two lanes to four lanes up to the intersection with Little Cottonwood Canyon Road, and then to widen the road to four lanes all the way up the canyon. Indeed, as a practical matter, that would be very difficult. (One of the "enhanced" bus proposals would add a shoulder lane for buses in peak periods but nothing for ordinary vehicle traffic.)

For these reasons, widening Wasatch Boulevard to four lanes in the segment between Bengal Blvd. and the intersection with North Little Cottonwood Canyon Road will do nothing to alleviate the traffic problems. Unless widening that segment can directly facilitate and serve a major upgrade in non-vehicle transportation in the canyon (discussed below), it would be essentially a waste of millions of dollars of taxpayer money. The "public input" meetings held months ago to discuss ideas or possible proposals for how a widened road would be decorated, etc., were, frankly, little more than a frustrating distraction and were of essentially zero relevance to the fundamental problems. It appears that the only real beneficiary of those meetings was the highly-paid contract consulting firm from out of state that conducted the meetings.

2. Neither of the "enhanced bus" alternatives as proposed in the report adequately address the problems."

"Under either of the "enhanced bus" alternatives in the report, less than one-third of the vehicle traffic in LCC would be replaced by buses—and that's if everything goes right and people decide to behave in the way UDOT hopes they will. Particularly over the medium and long term, reducing vehicle traffic during peak periods by less than a third is inadequate. Moreover, under the circumstances, it is questionable that the public will behave as desired.

The enhanced bus proposals depend on proposed "mobility hubs" at the gravel pit north of Big Cottonwood Canyon Road and in the area of Highland Drive and 9400 South. These are both a considerable distance from the entrance to LCC. Taking a bus from either of these points means being stuck in the heavy traffic along either Wasatch Boulevard southbound or 9400 South eastbound during the peak periods (and that remains true even if Wasatch is widened between Bengal and North Little Cottonwood Canyon Road). There is simply no escape for the buses. If one has to sit in traffic, it is generally much more pleasant to do so with friends in one's own vehicle rather than in a crowded bus with a bunch of strangers, and having to haul your gear from the car to the bus and stow it on the bus.

Adding the bus-only shoulder lane up the canyon would add some incentive to take the bus because the bus (presumably) can make the trip up the canyon faster. But the question is whether that will provide enough benefit for enough people to make it worth it.

Further, one bus from each “hub” every 6 minutes— 10 buses per hour from each—likely will not be adequate over time. If one of the two enhanced bus options is chosen, there likely will need to be more buses and more frequent departure times.

The buses also add a lot of noise and diesel exhaust to the canyon and the canyon traffic. This is a significant environmental downside.

3. Aerial transit has much greater potential benefit and promise

The Aerial Transit Study (ATS) analyzed several possibilities, but at the same time admits its limitations and acknowledges that it does not address some key elements. Nevertheless, the ATS option appears to have much greater potential than either of the “enhanced bus” options.

The situation we face in Little Cottonwood Canyon is in many ways analogous to the situation in Zermatt, Switzerland, located at the head of the canyon below the Matterhorn and other world-famous peaks. Zermatt is, of course, one of the great ski and summer mountain sport areas of the world. The ski capacity there, and the numbers of users/visitors and associated transportation demand, substantially exceeds Snowbird and Alta put together.

The main transportation line from Zermatt up the mountain to Furi, and then to Schwarzsee and Trockener Steg, is a cable car system (that we think would be classified as a 1S system in the ATS study) that is extraordinarily efficient, safe, and effective. Each cable car seats 6, and there are racks on the outside for skis. One cable car leaves about every 12 seconds, which yields a capacity to move up to 72 people per minute, or up to about 4,300 per hour. Passengers change to a second line at Furi, a seamless process requiring walking a few yards, and take a second line that goes through Schwarzsee and up to Trockener Steg. The whole system operates automatically, without the need for an operator in a large tram, and with the passengers doing all for themselves quickly and efficiently.

In the context of LCC, it would seem logical to run such a line from near the junction of Little Cottonwood Road and North Little Cottonwood Road (Routes 209 and 210) to a point near the Tanners Flat campground (a trail could be constructed from there to the trail to White Pine and Red Pine Lakes for hikers), then a second line from Tanners Flat to Snowbird, and a third from Snowbird to Alta. It is the case, as the ATS study point out, that more towers would be required than for a 3S system, but the towers are smaller, shorter, and easier and to construct, and have a considerably smaller footprint than the large towers required for a 3S system. The Zermatt-Furi-Trockener Steg line has an outstanding safety record, and has been most satisfactory in the winter environment above Zermatt (including the winds). We would strongly urge studying this system, and recommend that UDOT consult with its operator, Zermatt Bergbahnen AG. (Schluhmattstrasse 28, 3920 Zermatt, Switzerland; phone: +41 27 966 01 01)

In September 2018, Zermatt Bergbahnen also began operation of a new 3S system between Trockener Steg and Klein Matterhorn with cabins that seat 28 each and with a capacity to move

about 2,000 per hour. (See <https://www.matterhornchalets.com/2019/05/08/3s-matterhorn-glacier-ride-zermatt/>)

We believe that if such a cable car system such as the one recommended here and associated parking facilities were available, thousands of skiers and other users of the canyon would happily avail themselves of it. Travel up the canyon likely would be faster, and certainly would be more relaxing and provide even better scenic views.

A cable car system such as the one recommended here would necessarily require construction of a parking structure at or near the beginning station. The logical place for such a structure would be on the east side of North Little Cottonwood Canyon Road near the current Little Cottonwood parking lot, building the structure into the mountainside and designing it in a way to incorporate it into the topography insofar as possible. We are aware of the numerous legal issues arising from Federal property ownership, permitting requirements, and other matters involved. However, solving these issues is unavoidably necessary to any medium-and long-term solution to the problems that any of the proposals are designed to address.

Indeed, even with the enhanced bus alternatives, we believe that it will prove necessary to build such a structure, or one similar in concept to it, in any event. Further, widening both Wasatch Boulevard and Little Cottonwood Road for the purpose of facilitating more efficient private car travel to such a structure more efficiently would appear to make some sense.

We believe that construction of a gondola system and associated facilities recommended here should not wait decades. Our traffic problems in the canyon are acute now. Once decisions are made, we believe financing and design should be pursued without unneeded delay.""

"4. It is necessary to find an effective way to limit the number of personal vehicles in the canyon on peak and heavy usage days

Because of obvious topographical and other physical limitations on available and potentially available parking space, and to reduce canyon traffic congestion, it is imperative to find an effective way to limit the number of personal vehicles driving up the canyon on peak and heavy usage days. Any proposed solution to the transportation problems needs to give users of the canyon adequate incentive to use the new system instead of driving personal vehicles (possibly including direct disincentives to drive personal vehicles). There are several possible ways to do this that will require further consideration and analysis. They include, but are not limited to the following, each of which can be further refined and adapted in a number of ways:

- a. Charge all vehicles (except for residents and employees) a toll for driving up the canyon that is more than the cost of tickets for a cable car or bus and for parking at a "hub" or parking structure.
- b. Prohibit driving up the canyon for all but employees and residents during peak or heavy use days.

c. Cap the number of cars (other than residents or employees) allowed in the canyon on peak or heavy use days, requiring everyone else who doesn't enter the canyon within the cap number to take the alternative system selected.

5. Other safety needs for Wasatch Boulevard need to be addressed without delay.

Whether Wasatch Boulevard is widened or not, there is a serious traffic safety issue that needs to be addressed in any work on this road. The intersection of Wasatch with Kings Hill Drive (on the east) and 8350 South (on the west), where Kings Hill and 8350 South are also slightly offset, is a dangerous intersection for left turns exiting the associated residential areas, particularly because of the curve in Wasatch Boulevard just south of this intersection which cuts off visibility of traffic coming from the south. It is important for the safety of residents in the neighborhoods on both sides of Wasatch that a traffic light be installed at this intersection. It is not necessary that the light cycle at set time intervals. Designing it to trigger when a vehicle arrives at the intersection and wants to turn left onto Wasatch would maximize traffic flow and efficiency.

In this connection, we strongly oppose adding roundabouts to Wasatch Boulevard. There is not sufficient space to construct roundabouts that would be large enough to be efficient and safe. Moreover, the cross-traffic coming from Bengal Boulevard, Honeywood Cove Drive, 3500 East, Kings Hill Drive, 8350 South, and Russell Park Road is not of a sufficient level to justify slowing the flow of traffic on Wasatch Boulevard that would result from constructing roundabouts.

6. The current speed limit on Wasatch should not be reduced

There are a few very outspoken residents who demand that the speed limit on Wasatch be reduced to 35 mph. For reasons that are difficult to fathom, these folks seem to believe that this would magically force commuters who now use Wasatch to use Highland Drive as a commute route instead, and will somehow solve what they seem to perceive to be the problems on Wasatch Boulevard. In our opinion, that view is completely unrealistic. It is unavoidable that Wasatch Boulevard will always be a main commuter artery.

Further, there are less than a handful of homes—perhaps 5 or 6— that actually front on Wasatch Boulevard in the 40 blocks between about 6000 South and 10000 South, and most or all of those are located in a three-block stretch between Kings Hill Drive and Russell Park Rd.

We are unable to see how reducing the speed limit to 35 mph would have any beneficial effect on traffic or related issues. It would accomplish nothing other than slower traffic and more traffic backups and frustrations during rush hours and other higher usage periods.

#6270 - C Craig Zimmerman

I truly appreciate the opportunity to make a few comments on the proposed UDOT alternatives for the Cottonwood Canyons, more specifically, Little Cottonwood Canyon. My comments are general and address the overall process that has been on-going since the Mountain Accord days. I have asked that my name also be added to a community analysis as one of a large group of home owners who live in and near the mouth of Little Cottonwood Canyon. My opinion of the proposed alternatives is included there and I truly hope that this will be actually read and given serious consideration as there was a great deal of study, thought and professional analysis that went into those comments.

Since the percentage of Utah residents that ski is only around 6-7% of the total population, there are a lot of tax payers and residents who will think of many more important uses for such huge amounts of our tax dollars. Too bad they know nothing of what is being contemplated for the benefit of two private resorts. So, before we all just roll over and accept the huge amounts of money being proposed for the benefit of privately owned resorts, I think it would be appropriate to begin posting the amounts of ski resort liability and responsibility toward these costs, and in specific detail.

For example, the proposed parking or "transportation hubs" will be a substantial cost. Should tax payers bear the cost alone or should the private ski resorts, reaping the benefits, be required to accept their responsibility? Consider that businesses in Utah are usually required to provide adequate parking for the commercial operation they are engaged in. I had the privilege of building and adding onto facilities for our company that served Utah and the Salt Lake Valley for 64 years. When we had to present plans to planning commissions before obtaining permits we were specifically required to provide on-site parking on our own property for the projected number of end users. An alternative for this was to provide validated parking stickers for other parking facilities, but the burden still fell to us for providing parking for the customers we served.

We were forced to accept the cost of parking for our customers one way or another. This prevented us from building larger buildings because we were required to have adequate parking on site where validated parking was not available nearby. Street parking was never a consideration permitted by the planning commissions we met with for approval.

It seems that the privately owned ski resorts have been able to avoid this normal business expense and responsibility with the help of our tax dollars and the allowance of roadside parking on our highways and neighborhoods. The normal requirement of parking for private businesses has been overlooked or forgiven by politicians from the various cities and county and that has saved these private businesses, (ski resorts), many millions of dollars. Is it not enough that our state pays for Millions of dollars of advertising world-wide for these private businesses?

I believe it is reasonable for citizens of Utah to expect that these businesses will be paying for the expenditures for these "transportation hubs", (parking facilities). It is past time that they

accept this responsibility to provide parking for their customers rather than allowing tax dollars to do it. In addition, the on-site ski resort parking facilities are inadequate and the roadside parking in the canyon is just one more problem that creates a safety issue as well as detracting from the overall expected experience of the end user. If private car usage is continued to be permitted then the resorts must be held accountable to upgrade their inadequate parking facilities on their own property.

This is merely one example of how the ski resorts are being provided with “special” consideration that other businesses do not receive. Some would call this discrimination against small business. A gondola option as suggested, would require significant outlay and the figures shown are intentionally misleading because they do not account for the snow sheds that would still be required or the roads would continue to be as dangerous and subject to the whims of the storms as they have been. This is the process that UDOT and special interest groups use. They low-ball construction estimates to get easier approval, a foot in the door, and then go back for funds to finish because initial estimates were intentionally low-balled for easier approval, but knowingly not enough for completing the project on budget. We can easily see this happening with the impractical gondola proposal.

Through all of this planning, the hundreds upon hundreds of homes that are adversely impacted by this rush to aid the ski resorts have received miniscule, if any consideration by UDOT or Wasatch/Mtn. Accord and the various stakeholders. There has been zero discussions or concerns about any relief for the home owners held hostage to ski traffic through our neighborhoods. If we are all in this together then don't just concentrate on how to improve things for the top of the canyon, but rather consider solutions for the very bottom of the canyon equally. That brings me to one of my main concerns and that is the limited scope and area considered in the initial EIS.

FLAWED EIS – Despite our attempts to have UDOT expand the EIS to include all major arteries leading into the canyon funnel, many of us believe the EIS, just completed, was intentionally abbreviated to reduce obvious costs and it should have covered expanded areas and a broader scope. The impact of road closures, long lines and denied access to hundreds of our homes has not been considered in any of these studies or plans that have concentrated on smoothing the access for skiers to the resorts at the top of the canyon. Certainly there is no thinking person that could argue these communities are not impacted. Any impact study needs to include all the areas of impact or it is simply . . . incomplete. Many residents feel this is an ugly reality of our community leaders where the money from visitor's two week vacations is more important to tax base coffers than our lives as residents and property owners. There have certainly been NO efforts that would convince us otherwise!

On many days, the lines of traffic clog every access artery leading into the mouth of the Little Cottonwood Canyon. Skiers have found back roads through neighborhoods that give them a few minutes advantage to get into the main stream of the bumper to bumper progression, and they virtually jam every access and prevent residents a reasonable return time back to their

homes. There are times when park and ride cars are left in our communities and to such an extent, that it frequently feels as if we have built our homes in the middle of a major parking lot. There are times when returning to our residence after a quick trip to run a child to school or quick trip to the store or early appointment cannot happen for 1-2 hours. This is totally unacceptable! Do Utah resident home owners not warrant more consideration than this??? So far the answer would be a resounding NO! That is a shame and should be an embarrassing admission from every mayor, city council member, state legislator and Governor, but it seems it is easier to just ignore a difficult situation.

The only way to resolve these problems is to include at least the main arteries leading into the mouth of the Little Cottonwood Canyon funnel in the total EIS. Failure to do this will prevent these troubled areas from sharing the benefit of serious consideration and optimum solutions. Denying homeowners and residents access to their own homes without waiting in the same 1-2 hour lines is totally unacceptable. The thinning of traffic must take place before it enters the funnel, which begins at Wasatch Blvd. It's a huge problem for hundreds of homes, not just one or two or a dozen or so!

All efforts, all planning, all expenditures have been focused on getting more people to the ski resorts at the top of the canyon and none have given equal concern to the detrimental problems at the bottom of the canyon and the arteries leading into the funnel of the canyon. More studies, more time and less haste to spend tax payer's money need to be explored with more detailed EIS and alternate studies to determine several major points of concern.

1- What percentage of daily ski traffic come from Utah Valley, Draper and what route do they use to access H-209, H-210? If it has not been done then it needs to be studied. If it has been done then the results need to be made public. There are days when Wasatch Blvd are grid locked for nearly 2 miles south of 9400 S and for over 1 mile west of 9400 S. These routes can't handle the kind of access they receive without creating grid lock for residents trying to regain access to their homes if they must leave during heavy traffic periods.

2- What is the Canyon's carrying capacity? What amount of traffic and general usage can Little Cottonwood and Big Cottonwood canyons handle. No formal study has been completed to determine this and yet we are proceeding without that kind of knowledge and ready to spend hundreds of millions of dollars. We may find that a responsible study could indicate that we have already exceeded responsible carrying capacity. Certainly, we know for a fact that the use of these resorts for Olympic venues were not considered because it was determined to be detrimental to the environment of these small and fragile canyons. What has changed??? What made them less fragile?? The public needs many more answers that have not been forthcoming.

3- These public comment periods are great, but with the very limited advertising, the vast majority of Utah residents have no clue that these expenditures are pending or being considered. There needs to be much greater resident involvement. The number of people

responding to this public comment period will be dismal compared to any professional organization's attempt at getting a representative consensus. For example, Envision Utah would likely obtain comments from 20-50x or more than the number of people responding to these three presented alternatives. I guarantee that the vast majority of Utahans who will share the burden of paying for the costs of subsidizing the private ski resort owners and more UDOT programs are still not aware of the proposed expenditures for these canyons.

Finally, I want to copy a small portion of our community endorsed response to UDOT and these presented alternatives. They are so well presented that I include them as part of my comments in the hope that more people might have the opportunity to see and consider such serious and professional analysis.

Carrying Capacity and Other Issues

The additional critical points regarding the future of LCC are related to but not directly tied to the UDOT EIS.

1. Canyon Carrying Capacity

- a. When making changes to an existing current state there are desired outcomes and often undesired outcomes that can be anticipated or unanticipated. What do we want the canyon experience to be and how will any related decision impact that vision?
- b. Two key published drivers of UDOT's project are safety and reducing/eliminating traffic log jams/delays occurring on powder days. To what degree does a specific transportation choice introduce perhaps an unpublished objective: increase the number of visitors to the canyon?
- c. Snowbird and Alta have made public their belief that when their parking lots are full there is still plenty of capacity on the slopes for additional skiers. The comparative density standard they are applying is that of the ski experience found at California resorts which is greater than normally enjoyed here. The Forest Service leaves the management of the skier experience up to the respective resorts.
- d. Currently canyon visitor occupancy is indirectly controlled by the limited parking at the resorts, trailhead parking lots and whatever off highway space drivers can find. In many ways LCC's transportation challenges have helped slow use demand relative to an increasing population.
- e. The Forest Service also takes no position regarding the capacity of visitors during the summer. They employ strategies to mitigate the impact of increasing numbers: closing areas that have become "worn out", harden trails (asphalt), increase parking lot size, install toilets, etc. What they won't do is promote discussion with the general public on what is the desired experience of visitors to the non commercialized canyon sites. When does an increase in volume of visitors degrade the outdoor experience?
- f. Over the years both BCC and LCC have gone through incremental change without the benefit of a formalized carrying capacity study: how much activity can the canyons handle? You can put a lot of skiers on 10' of snow without necessarily degrading the ecology. Summer visitation is different. At some point nature cannot accommodate an increase in users.
- g. Mountain Accord went through its process and made their recommendations without conducting a capacity study. The CWC has agreed a study should be done not only on how

capacity impacts the ecology but also on how capacity impacts the subjective experience of the visitor. However, the Commission is requiring any CWC study to be done simultaneously with other CWC initiatives that are part of its charter. And yet here we are considering transportation options, without the benefit of a consensus on the canyon carrying capacity, that may have both anticipated and unanticipated consequences.

h. Sometimes it feels that we are expecting more out of these canyons than they can deliver based on their ecology, small size and importance to valley water supply. They are unique and special places.

i. A carrying capacity study that includes a visitor's desired experience component needs to guide decisions regarding LCC.

2. Socializing cost, privatizing profits

a. The gondola solution requires major capital dollars for permanent transportation infrastructure to be built, operated and maintained in LCC. While safety and traffic flow are the primary concerns driving the initiative the proposed transportation system serves and solely benefits two private businesses. If this solution is selected it would be appropriate that the two private businesses solely benefitting from this public project make a significant contribution to the cost of the installation and its ongoing operating costs (beyond just providing passes for employees and season passholders).

3. Growth and development confronts "life elevated"

a. The phase "life elevated" appears over a scenic Utah back drop. We market and sell this untouched natural beauty to attract business and development. Yet it seems like development and growth reigns supreme in this state. At some point in time this strategy runs smack into the image of scenic Utah and brings diminished returns.

b. Several years ago both Mountain Accord (MA) and Envision Utah projected massive increases in regional population over the next 20 years. As part of their argument for change MA inferred that all the demand for recreational activity from this growth would be channeled to BCC and LCC. We just needed to figure out how to put all that increased demand into the existing recreational "container". Perhaps a better solution for Utah would be to find or develop additional outdoor recreational options: create new campgrounds, hiking trails and reservoirs to handle increased demand.

c. Yosemite has a reservation and lottery system to climb Half Dome via its cable system. Zions prohibits personal cars and is considering a reservation system for park entrance. The Wave trail in southern Utah requires reservations. Finite fragile resources require changes in how we share and use them.

d. The nature of small box canyons with vertical walls in a watershed area does not present the same development opportunity as does the open space that surrounds places like Park City, Vail, Beaver Creek, and Whistler Mountain. Yet MA had members who advocated a cog train along 9400 south and up LCC (which UDOT appropriately determined unfeasible for several reasons). In contrast, Jackson Hole has done a nice job limiting development sprawl at the base of their mountain and in providing bus service from town.

I appreciate the opportunity to post my concerns and comments,

Sincerely,

C. Craig Zimmerman

SOLUTIONS or SPECULATION.

Sometimes criticism is in order for one to see more clearly.

It is both laughable and alarming that UDOT would devise and propose such a project scope as to appease private interest, that entails expending hundreds of millions of dollars (of public, tax payer dollars) for construction of a gondola to serve ski resorts desire to increase patronage, and widening of Wasatch to Neiderhauer's desires to deliver patrons to his planned Ski village development for the LaCallie property. If you think residents are not savvy to the upcoming developer desecration of this area, guess again. UDOT ought to be truly ashamed to roll out these horrific solutions to public. UDOT has vested interest in "selling" these investor ideas, particularly since UDOT is poised to cash in as well. While private sector investors stand to profit while local areas resident lose BIG! Are these projects necessary? And, more to the point, do these proposals fit within the scope and plans of local communities that will be impacted by these developments.

How convenient of UDOT to drop John Thomas (former EIS project manger) from the EIS project after he committed, on behalf of UDOT, to lower speeds on Wasatch to 35MPH, by creating a revised design speed for Wasatch Blvd/SR210 using traffic calming measures and creating a scenic highway. That is the Wasatch Blvd residents were sold, July 2019. How convenient it is for UDOT to just pull the plug on community concerns for safety, and force-feed 7 LANES of TRAFFIC, 1-2 miles of road-widening, for NO APPARENT REASON, other than to steer patrons to the planned Neiderhauser Ski village and gondola station. UDOT, you have pimped yourself to private investment interest, and it's blatantly obvious UDOT is following the MONEY, too - grabbing for large scale FUNDING while irreversibly destroying local area neighborhoods, degrading safety, increasing traffic, and impacting both air quality and noise pollution in the process. YAY YOU, UDOT. ☹

UDOT is CHASING THE BIG MONEY:

No one is a stranger to understanding the process whereby tax payer funds get directed to udot for projects: First the agency must create "perceived need"; then support said need with creative statistical data that point towards prescribed outcome; litter it lots of studies, to the point that public is overwhelmed and won't bother to analyze details or pose questions; and, finally create solutions that promote the "desired outcome", then seek funding. It is well known that agencies and the state are pushing the "Growth" agenda: CWC, WFRC, Envision Utah. Utah has a few economic drivers, and Ski industry is a tourism cash cow. Introduction of Ikon and Epic passes have shown ski industry the means to reap profit with projected growth, and they are ready to cash-in. Yet, neither Snowbird nor Alta will pitch one \$1.00 into the pot to fund these projects, either. Rather, they intend to bring home the bacon on TAX payers dollars to secure future profits.

The solutions presented have more failures than salvageable aspects, imo, so with that:

NO GONDOLA:

The gondola is the most ineffective and inefficient solution to move patrons to resorts during winter months. It is unsafe, there are no contingency plans presented for emergency rescue, during power outages or high wind shut down. There will be need to clear-cut forest for its installation, along with emergency and tower maintenance access points en route. And, the suggested, estimated, guesstimated travel times and logistics of the study are unsubstantiated, and ridiculous, guesswork at best. There is no viable "last mile" solution presented for local areas residents, who will be forced to drive 1-3 miles to a transit hub, pay to park, then take a bus, then transfer to a gondola. At min. an anticipated 1.5 hours travel time for local areas residents can be expected, with min. of 2 transfers, after driving and parking a car, if on schedule. Whereby to compare current trip time, by car or bus, up-canyon travel time is approx 17-20 minutes, during normal conditions. I hesitate to ask, but are there actual "planning" engineers working at UDOT, as these solutions seems more poorly contrived than what interns could come up with. Roles of Planners and Engineers are higher differentiated, nothing has yet been engineered, which leaves more question than answers to public. Nothing about these presented solutions seem resolved, nor logical, and this is long after UDOTs been dragging its feet in this process for the past few years.

The costs for the Gondola is a monumental waste of tax-payers dollars, it is simply not the most effective nor efficient solution to transport people. The gondola is seasonal use, and does not address nor meet needs of back country skiers, nor will it have mid-point stops, nor summer use for hikers and mountain bikers.

The gondola solution appears purely out of a greed-driven investor agenda, and UDOT, as public agency, has allowed itself to succumb to those "stakeholders" whims with complete disrespect to local areas residents and the negative impacts such a project will inflict upon the local area, and with disrespect to local and regional master and general plans for the area. There are no local area master or general plans that include use of a gondola in any capacity, so how did it end up in your solutions. By its inclusion in UDOT's solutions, you are creating changes to local and regional plans that do not call for a gondola; its inclusion obviously caters to speculative development plans of private sector interests. For a public agency such as UDOT to align itself with private sector interest over public interest raises question for concern. Alternatives: Dare to consider for a moment that a rail system will deliver folks to resorts efficiently, and can be designed with mid-point stops and year-round use. Perhaps UDOTs negate to consider rail system because Doppelmayr (the gondola company) does not yet have a rail system that will work for this purpose... too bad, shop it around. They are not the only game in town so to speak, though, literally they are (since they located USA headquarters here for this very purpose). Initially, and more to the point of functional, low costs solutions, the use of buses present the most flexible plan, and are the obvious solution. The implementation of snow sheds, in respect to safety on the canyon road, are warranted. Snow sheds can be designed aesthetically to blend into natural landscape, and can serve dual purpose functionality as wild life crossings. Suggest to start here, and study this process as to what ultimately can solve any "perceived" traffic issues, this is a best-practices approach.

Will also interject, as I have in past, to change current snow tire laws - to demand all vehicles traveling up both canyons to be equipped with either Chains, or Mountain/Snow rated tires," and do not allow M+S rated tires as satisfactory for canyon driving, which is the current status of this law. You have \$66 mill to study, suggest to look it up - plenty of studies on differences in traction between these tire types for severe winter driving. Frankly, with your \$66 mill study money you could buy all winter ski-pass holders, resort employees, and tourism travelers into the canyons a real nice set of true winter snow rated tires (they last average 4-5 season). Dare conduct this study, and let's see how the number of car slide off incidents drop. Canyon traffic congestion loading/unloading in inclement weather is 99.9% result of vehicle slide offs. Let's please stop allowing this easily remedied safety issue to persist year after year.

NO WIDENING WASATCH TO 5 OR 7 LANES.

Widening of Wasatch Blvd/SR210 has far too long been the largest point of contention with local area residents, with both their mayor and council reps, and UDOT, in respect to safety of residents as they ingress/egress adjoining neighborhood streets that feed onto Wasatch Blvd. The consensus is that residents struggle to safely exit/enter neighborhoods currently with a 2 LANE road and 50 mph speed limit, it is simply unsafe. If UDOT bothered to acknowledge the numerous comments it has received on this very topic, you'd know and address it accordingly. Not addressing known safety issues is pure negligence on your part. Is UDOT willing to assume the liability for accident and resulting deaths that occur due to known road safety issues? The High-Tee project of 2017 only served to further reduce safety along Wasatch, and failed to even address cycling and pedestrian safe passage through that intersection in its design conception. Your agency has obligation to increase safety, not decrease road safety. Adding a light for cyclists to cross thru the high-tee was a last ditch effort demanded by local residents to get some form of cycling safety, that element was clearly left out of UDOT's design plans, and you were happy to build it as planned. Shameful. UDOT, by its own admission, has noted publicly that the intersection fails, and is already looking to redesign the high-tee, in all confirming UDOT's inability to actually skillfully engineer a basic intersection, not to mention another huge waste of tax payer money. Be it Federal, State, County, or City, the funding UDOT receives for project is PUBLIC TAX PAYER MONIES collected through taxation. UDOT's priority of response therefore is to PUBLIC LIFE, SAFETY, WELFARE, not private investor interest.

The last few years area residents braced themselves for the worse, in respect to Wasatch widening plans, pleaded with city council and mayor to not allow area neighborhoods to succumb to road widening, which would ultimately degrade safety and sever the community. Residents have engaged repeatedly thru open houses, design charrettes (another monumental waste of time and expense) demanding the road remain 2 lanes, or possibly to add a reverse bus/mass transit lane to appease intermittent winter peak time ski traffic, but above all to reduce the speed limit, to 35MPH, through implementing design speed changes, and add traffic signals where necessary to reduce risk of injury to drivers(Kings Hill). UDOT at least, in superficial appearances, over the past 2-3 years, seemed attentive to residents concerns, and even made a commitment to local residents to work to increase safety along Wasatch by reducing the

speed on Wasatch to 35MPH. Fast Forward, to the “revised” EIS solutions you still maintain the 50MPH, in all 3 solutions, and fail to even acknowledge the 2 July 2019 commitment to local area residents to increase safety through speed reduction on Wasatch. For an agency with a “Zero Fatalities” goal, you seem hell-bent to force accidents and potential injury/loss of life in presenting these new solutions, all of which widen Wasatch, be it 3, 5 or 7 lanes and, still maintain 50 MPH (and, to enlighten local area residents: 12’ shoulders are LANES, Buses on shoulder will require 12’ width by Fed mandate, so yeah... who are you kidding calling a shoulder a bike lane?). Straightening Wasatch Blvd at Kings Hill will require the destruction of area residents, their homes will get destroyed, you’ve already black-listed those homes from market.

The section of Wasatch Blvd/Sr210 discussed is a mere 1-2 miles, to widen it serves no useful, nor logical purpose other than to force MORE cars into the area unnecessarily, shifting the bottle neck south. By your admission, you stated the road widening was not in respect to ski traffic, but to alleviate commuter traffic. Yet, because you have no jurisdiction over Wasatch south of the high-tee you have no ability to widen that section for the very reason you claim the 1-2 miles demands widening... so, you are alleviating nothing, your thinking process is illogical, and irrational. Factoid: Wider Roads and more lanes induce MORE cars and congestion. You cannot encourage and expect increased alternative transportation use when you open up the road to invite more cars, it’s contradictory, and rather illogical. Udot seem reluctant to utilize the \$66 mill to study the Highland bridge and widening option to appease local commuter traffic, without reasonable explanation to public. Unless, of course, your desired outcome in widening Wasatch is to appease investor interest, such as steering as many cars as possible into a future Ski Village commercial development, such as Neiderhauser’s plans currently being floated for the redevelopment of the La Callie property. (sorry to repeat, just wanted to make it blatantly clear, public is aware of the intentions of these proposed solutions.)

Choke in this. More lanes means more cars idling, rather than 1 lane of cars idling along the road during canyon closure days, there will be 2 to 3 LANES of vehicles spooling emissions waiting for canyons to open, or roads to clear. Where are the Environmental Air Quality impact studies and reports? UDOT has \$66 million to study and scope this project, yet not one single \$1.00USD was spent to set up A/Q Monitor stations along Wasatch over the last year, despite residents demanding it to do so, repeatedly. Air quality degradation presents a huge health concern, and you have failed to provide any tangible proof that widening Wasatch will not negatively impact Air quality. With that, I will request, again, UDOT to conduct a year-long study that includes peak winter season, and evaluate Air Quality based upon actual results, and do a comparative projection to the planned added lanes to Wasatch, perhaps using Bangeter Hwy on same given days. The other Environmental Impact Study you have casually FAILED to produce is that of NOISE POLLUTION. Please present public with a comprehensive Sound study for local area residents, on increased noise levels when you Widen Wasatch blvd to 5 or 7 LANES. And, include the Sound Study for the current road design speed of 50 MPH(as it is today), and the desired design speed for the road at 35MPH as preferred by local area residents – spoiler alert - the difference will be staggering. Hardscape, i.e. concrete/asphalt, and massive areas of

it only serve to amplify sound as do increased speeds on roads. Road Noise dissipates almost 40-50%, when dropping from 50MPH to 30MPH. Take time to look it up with your \$66 mill study money. Perhaps to get a real life perspective, take a tent and sleeping bag and camp out along Bangeter Hwy for a few days to conduct a sound study.

What you are proposing with widening of Wasatch Blvd/SR210 for the small residential area in Cottonwood Heights, is nothing more than a road of Bangeter Hwy proportion, scale, and speed. It is inappropriate, and serves no purposeful function other than to shove a bottleneck a few miles south. If widening the road was such a logical solution then why does your solution not propose to widen Wasatch/SR210 all the up to the mouth of LCC 7 LANES, and why stop there, why not widen the canyon road to 5 lanes right on up to Snowbirds parking lot? The illogical approach UDOT has taken to this project just validates that UDOT is only seeking to secure large scale funding for its agency into future, and position itself to enable private interest projects, at expense of TAX PAYERS.

NO TO OVERHEAD BRIDGES:

You're vision of Wasatch/SR/210 is that of Bangeter, if you measure success by how many cubic feet of concrete you can pour through an area... then well, you have succeeded. Widening Wasatch/SR210 severs community and neighborhoods, and cuts-off east bench residents from its city. Bridges only serve to band-aid poorly planned solutions. Overhead bridge aesthetics = fail, they will be littered with plastic cups and political signs.

Walk-ability and Bike-ability are completely missing from your solutions. Your solution forces cyclists to co-mingle with buses in a 50 MPH unprotected lane. You clearly spent effort determining costs for purchasing the houses necessary to mow down for road widening, road, and gondola costs, and frankly UDOT you seem myopically focused on the gondola, speed, and road capacity.

MOBILITY HUB VS. PARKING LOT:

Sugarcoat it with whatever terminology makes you feel better as to how you spin it to public, but a 5000 car capacity parking structure is just that, PARKING! Cottonwood Heights will become the door mat, aka "the city between parking lots", with Wasatch blvd morphing into nothing more than an east side version of Bangeter Hwy. You are not moving cars, rather you are parking cars, creating more local area congestion, by inviting more vehicles into the area, degrading air quality in the process, and destroying what little mobility local area residents currently have (due to the unsafe aspects of Wasatch blvd). Cottonwood Heights cannot afford to maintain such a visually obtrusive grey elephant, that will get utilized maybe 10-20 days per year, at best. But, perhaps Neiderhauser will offer to suck more SL county grants to fund it, if made part of his Ski Village plans, particularly now that he has learned how to use tax payer money to fund private investment interest.

With push-back from Holladay residents, who have now been enlightened to a possible massive mobility hub near the north end of the gravel pit, this aspect of your project has become a hot

potato. The developers of the north property failed to include anything remotely resembling a mobility hub in their first schematics, rather suggests no one wants to build nor maintain parking structures, they are not warranted. And, they would not be necessary if better quality mass transit services were implemented, putting that on UTA's shoulders. It is known that UDOT cannot seek funding to create reciprocal parking agreements with all of the surrounding office complexes sitting in Holladay-Cottonwood office commercial center(3000 E/6200 S), so it prefers to go after funding to create and construct new projects, despite there being thousands of parking spaces that could serve to help park tourism travelers during peak times.

SOLUTIONS:

In short, yours EIS solutions suck, all of them. I won't waste time repeating what has been previously discussed and on public record. There were numerous, viable, creative ideas and solutions floated during the past few years with UDOTs EIS scoping process, from your agency, from community members, and other experts and stakeholders, all of which have been completely discarded in favor of WIDENING Wasatch Blvd/SR210 and constructing a gondola to serve ski area and private sector interests. It was blatantly obvious this was going to be the result of years of snookering residents with the BS dance. UDOT has a obligation to host open houses in the process, and has met that state mandate with nothing more than lip service to residents. Seriously, who hires a Nebraska firm to conduct design charrettes for Cottonwood Heights - those folks did not even know the area, let alone the long standing issues and concerns of its residents, and their ineptitude was not well received. Add charrettes to the list of monumental waste of tax payer money and time.

Because your solutions fail to address and respond to local area residents concerns for safety, negative impacts on air quality, increased noise pollution, and, and concerns for destruction of communities and neighborhoods, it perhaps time for residents to go to state and demand your agency not desecrate this area in the name of private sector interest, and in process set establish a citizen oversight board of your agency.

UDOT, IT IS TIME TO GO BACK TO THE DRAWING BOARD

Date: June 3, 2020

Re: Little Cottonwood Canyon Transportation Proposal

As discussed previously, attached is a copy of the LaCaille Center project and our Gondola Amendment Request Proposal. As it relates to the proposed Little Cottonwood Canyon Gondola proposal and as defined by the UDOT Gondola Feasibility Study ("Study"), we are requesting that the information in the attached Proposal be taken into consideration during the process of finalizing the EIS presently being prepared by UDOT.

Our request is to have UDOT amend the Study to incorporate the following:

1. Use the alternate site location for the base station
2. Incorporate public parking at the base station
3. Incorporate two mobility hubs for bus access to the base station and;
4. Utilize a signalized intersection as demonstrated in our proposal to assist in alleviating residential access blockages to Highway 210 during skier and tourist peak travel times into Little Cottonwood Canyon.

Our reasoning whereby we are requesting this amendment is that based upon the information provided to us through the present UDOT Study and others, the Gondola (in comparison to the other transportation options) solves **ALL** of the UDOT stated primary and secondary objectives including:

Introduction and Description of Proposal

June 3, 2020

This proposal is an introduction (the Proposal), description, and recommendation that introduces two projects that, when united, because of their close proximity, work exceedingly well together and truly create a local and international destination. The projects collectively will further enhance the area and provide a 50-year+ transportation solution and completion of a critical part of a regional multi-modal system whereby residents and visitors can enjoy Little Cottonwood Canyon (LCC) without the need to use personal carbon based vehicles. The Proposal is written in two parts and briefly described below:

Part One – Describes the LaCaille Center and Villages which preserves some of the meticulously landscaped lands, river corridor, vineyards and provides public park and trail accesses, creates a few new residential and light commercial uses and in the text of the proposal, it refers to the LCC gondola and its interaction with LaCaille Center and Villages.

Part Two – Proposes that the Utah Department of Transportation (UDOT) locate the LCC gondola base station (*if* chosen as the transportation solution in its Environmental Impact Study - the “EIS”) be located alongside North Little Cottonwood Road as described in this Proposal versus at the base of LCC (near the Y-intersection of Hwy 209 and 210) as defined in the UDOT Gondola Feasibility Study as Scenario 3B.

Proposal Summary Description - LaCaille Center and Villages (Part One) and the Gondola proposal (the base station has been named LaCaille Base Station) are linked via a new road named LaCaille Lane. Because of the “link” they share and their related design elements, the synergy of the combined projects create a unique gathering place for our community. Both projects are described in this Proposal in order to define and explain to the residents, visitors and tourists the cohesive design and seamless plan for the LaCaille Center and LCC Gondola.

One of the primary objectives is to define and refine LaCaille Center and Villages establishing its new master plan (“the Master Plan”) for the 37.5 acres of land assembled near the mouth of Little Cottonwood Canyon. Please note that the Master Plan is continually changing, and as new ideas and thoughts are conveyed to the owner/authors during the planning processes the Master Plan will continue to evolve. The LaCaille Center and Villages Master Plan is attached as Exhibit A.

Defining the LCC Gondola and establishing its potential for solving the transportation dilemma in LCC is a priority. As such we are requesting that the UDOT preferred scenario for the proposed Little Cottonwood Gondola/Mass Transit System as defined in its Feasibility Study (“the Study”) identified therein as Scenario 3B (a copy of the Study is attached as Exhibit B) and dated July 9, 2019) be amended to reflect the change in the base station location to that as shown in this Proposal and; that UDOT utilize two mobility hubs versus one for transporting passengers to the gondola base station. Also used in formulating our recommendations is UDOT’s Purpose and Need Chapter and the Alternatives Development and Screening Process Report (also attached as part of Exhibit B).

Included in Part Two of the Proposal are details wherein the gondola base station is shown as an alternative and located on a portion of the property in the LaCaille Master Plan site (attached as Exhibit C). This alternative site is shown as a replacement for the Superior Peak Village Phase II homesites. This site will be preserved, to be used by UDOT or another governmental entity to construct the proposed gondola base station and its related improvements. The site includes enough acreage for a parking garage and circulatory system for some of the LCC transportation needs. The pedestrian, vehicle and busses together with the Gondola will complete this segment of the LCC needs completing a multi-modal and regional transportation system.

Lastly, we describe how the Gondola and a controlled Highway 210 system can be monitored and, if needed, as determined by the Forest Service in the future, (see Carrying Capacity Questions and Answers sheet - Exhibit D) provides the system with the means to implement limiting the human capacity factor in Little Cottonwood Canyon.

La Caille

Part One– LaCaille Center and Villages Description

Part one – LaCaille Center and Villages

Ownership and Management. The authors of this proposal have acquired and or own the site or have the right to purchase property (“the Property”). The company to purchase, own, provide the entitlement approvals and the development activities and related sales is Quail Run Development LLC (QRD). CW Management Corporation (CW) will be the manager. The CW managing personnel are Chris McCandless and Wayne Niederhauser.

Property Description. The Property is located on both sides of Little Cottonwood Creek (the “Creek”) consisting of approximately 37.5 acres near the mouth of LCC and lays between North Little Cottonwood Canyon Road and Wasatch Boulevard. The property south of the Creek presently hosts LaCaille Restaurant and other buildings, including the vineyard used to process its harvest into wines that are manufactured on site and sold to the public. The Property has several homes, being used for various purposes. The zoning is C-2; R-1-15 and R-1-43 and located in Salt Lake County, Sandy City and Cottonwood Heights City. The Property located on the north side of the Creek is presently owned by the Despain family (under contract to CW) and consists of 12.5 of the 37.5-acre site.

The Master Plan. The Master Plan as defined in Exhibits A and C are slated to use the existing assets in addition to creating a couple of new elements, all of which are subject to change dependent upon the approval processes and are preliminarily defined below:

- 1. LaCaille Restaurant.** The existing restaurant and its immediately surrounding grounds will remain in place. This unique building is highly prized and recognized by the community as a fine French dining facility and will continue to operate as a destination for individual dining experiences, meetings, small conventions, and for world-renowned weddings. It should be noted that some of the LaCaille grounds may have a conservation easement recorded to preserve its beauty in perpetuity.
- 2. LaCaille Winery Building and Vineyards.** The old winery building was recently demolished and will be replaced with a high-quality new winery together with a few enhanced attributes. The new Winery will be engaging to enthusiasts in concert with

the preserved vineyards. The perpetual preservation of the vineyards will be done in concert with a Sandy City rezone application for Monte Cristo Village. After the successful zoning outcome for a PUD use, the vineyards will be preserved through a conservation land use easement. The Winery building property is already zoned for its intended commercial use.

- 3. The Chateau Building.** The existing Johnson Mansion is slated to be converted into one of several potential uses that are still under review. One such use could be, among other concepts, as a second fine dining facility near LaCaille Restaurant. The Mansion's unique architectural features and heritage begs to become yet another LaCaille Center masterpiece for dining excellence. This property is already zoned for commercial uses.
- 4. Wasatch Estate Home.** The original Runolfson home is located near Wasatch Boulevard and Little Cottonwood Creek. Due to its size and unique European architecture, the home has several potential uses including the possibility to be converted and operated as a luxurious, high-profile bed and breakfast inn. The BNB will focus on and cater to private company retreats, family reunions, visiting dignitaries from all over the globe, etc. At a minimum, this could be a large estate for a family wanting to thrive in this natural setting along Little Cottonwood Creek.
- 5. LaCaille Boutique Hotel.** The hotel site, as shown on the Master Plan, is directly adjacent to LaCaille Restaurant and designed similarly to the restaurant with a European Village theme. The Hotel concept consists of 75 quaint rooms and is still in the planning stages although a sketch is attached for reference (Exhibit E). This site is located on property zoned for the intended use.
- 6. The Villages of LaCaille.** There are two residential Villages named after famous Wasatch Mountain peaks in LCC: Monte Cristo and Superior. Each Village will be individually designed and constructed using the finest European concepts and craftsmanship. Each home will be required to comply with the Design Guidelines

and Restrictive Covenants as defined in the CCR documents. Furthermore, the Villages will:

- a. Be clustered to preserve the higher priority landscaped and natural areas such as the vineyards, guest houses, Little Cottonwood Creek and other natural features located within the community to remain.
- b. Each Village will be unique in and unto itself although bound to adhere to the rules through a Master Owners Association (the “Association”) that will manage and maintain the tremendous open spaces, landscaping, trails and other amenities found at LaCaille.
- c. Three of the existing homes that are located on the Property will be remodeled and preserved. These homes will be used as guest cottages for short-term stays exclusively by friends and family visiting homeowners of LaCaille Center and Villages. Photographs of the homes and LaCaille property are attached as Exhibit F.
 - i. Two of the Guest homes are more than 100 years old and, if preserved as proposed, we will provide a place and plaque detailing its story to preserve its local history.
- d. Located around the site are a couple of parcels that lend themselves to be more like their contiguous neighbors. They are labeled on the Master Plan as LaCaille Village estate lots. These lots will be developed to reflect the size and quality of the adjacent neighborhood’s home size and related architectural designs.

7. **Open Space and Trails.** The objective of LaCaille Center and Villages open spaces and connecting trails is to provide public access and linkage to and through existing trails such as the Bonneville Shoreline Trail (BST), Quail Hollow and others. The connections lead users to LaCaille’s landscaped gardens, vineyards and then further onto regional trail connections, including Bell Canyon and Little Cottonwood Canyon Trail.

This open space and trail connectivity will allow the public to enjoy the staggering views of Little Cottonwood Canyon including the granite bells of Bell Canyon and the peace one can find alongside Little Cottonwood Creek.

Another benefit is that the trail system makes it possible for residents from all the areas surrounding LaCaille to be able to walk, hike, run or bike to the LaCaille Center restaurants, activities and, if approved, and constructed, the Gondola Base Station for access into LCC without ever needing to use their private vehicles!

The priority open spaces will be preserved by clustering the homes (versus developing individual lots) into a planned unit development (PUD). It should be noted that we are using the same existing approximate single-family home density in our PUD's as is allowed in the R-1-15 zones. This clustering, although not increasing the overall density, enables us to surgically remove open space from the traditional home site that is self proclaimed as our sensitive lands and place those lands into protected common areas.

As shown on the Master Plan any "off-site" proposed trails would (if approved and funded by others such as Salt Lake County and perhaps other landowners) provide a connection to a proposed new trailhead, parking and restrooms facility with access to the trails west of Wasatch Boulevard. The LaCaille trail system would also provide access to Bell Canyon and the Little Cottonwood Canyon trail.

Our overarching goal is to preserve, protect and celebrate the natural abundant beauty found in and around this unique place and share it with our friends, family and residents of the Wasatch Front community – it is breathtaking!

8. Vehicle Access. The Property presently has accesses via a private road from Wasatch Boulevard, from the Little Cottonwood subdivision at 3775 East and potentially Quail Ridge Road and on the Cottonwood Heights side of the property, Granite Oaks. Over the past few years, the owner(s) have arranged and or acquired these access rights to potentially expand vehicle ingress and egress. As one takes an elevat-

ed perspective of the Property, the existing accesses as described with some reconstruction, strictly meet the developmental standards and needs of the LaCaille and Despain property. With that stated, we also recognize that LaCaille and communities on both sides of the Creek are at risk of fire hazards and other emergency ingress and egress needs due to the present roads systems and their exposure to increased canyon related traffic.

Our desire to mitigate the limited access issues is to provide a better primary access significantly reducing the potential impact on our existing neighbors. This better access (and new infrastructure) will secure a higher-level benefit for the health, safety and welfare and protection of the watershed in the area for the existing and future residents and visitors. As such, we will develop a new road named LaCaille Lane. The Lane will be lined with deciduous and conifer trees, landscaped and lighted to re-create the atmosphere that has long been the identifying landmark entrance feature into LaCaille from Wasatch Boulevard.

LaCaille Lane and its adjacent ten-foot-wide pathway and landscaping, although private, will be open to the public. LaCaille Lane will originate at the existing access intersection on North Little Cottonwood Road (required to be developed with new intersection improvements) and lead to a bridge over Little Cottonwood Creek and to LaCaille Center which terminates at a roundabout.

It should be noted that the location and design of the intersection is just prior to a corner on Highway 210 that is meaningful for its view of LCC and the four bells of Bell Canyon (on the south side of LC canyon's north slope). The preservation of this part of the scenic byway is of the utmost importance! At the planned location, the LCC view will not be impacted by either the intersection or the alignment of the future gondola. This Highway 210 location/corner would be a good place for a national park-type signage announcing to the canyons guest that they have arrived in LCC.

9. Creek Bridge. The LaCaille Lane bridge is being designed to have iconic features. To that extent we are using the granite stones from the area including the LCC quarried

stones used for the foundation of one of the existing homes (slated for demolition). We will also use the homes salvaged solid brick pavers as an accent element to LaCaille Lane placed north of Creek Bridge. South of the bridge we will preserve and continue to use the existing red pavers found at the original LaCaille Center which together, the colored pavers will provide a demarcation point for the two side of the river and the Sandy City and Cottonwood Heights common municipal boundary. This iconic, granite clad and lighted bridge as it interacts with LaCaille Lane will serve as the primary ingress and egress to LaCaille Center.

LaCaille Lane vehicle access will end at the new Winery building and prior to Monte Cristo Village. Our plan is to separate Monte Cristo and its primary access from any vehicular interaction with LaCaille Center. This will minimize the traffic into the Little Cottonwood Subdivision located along the southern boundary of LaCaille. For Monte Cristo's secondary emergency access, there will be a gated 20-foot wide "trail" leading to LaCaille Lane.

- 10. LaCaille Center Finishing Touch.** As a finishing touch to LaCaille Center and Villages, we are incorporating for our residents an exclusive owner's association organization. LaCaille OA will provide the following to its residents:
- a) Discounts on services and food within LaCaille Restaurants including the Greenhouse reception area and the new LaCaille Winery.
 - b) Priority reservation systems for the restaurants, winery, the newly proposed ice-skating rink, reception events and all its related benefits.
 - c) Full, unrestricted use of the private grounds areas including patio, gazebos, etc. This will be a place to relax, enjoy the day and perhaps read a book.
 - d) The LaCaille OA will provide to its members and guests, ski and snowboard equipment and for their guests and even traditional and electrically assisted bikes to enjoy on the local trails.
 - e) Full maintenance of the grounds (including the members' homes) together with maintaining the building exteriors.

- f) Discounted room rates and reservations for friends and family at the Boutique hotel.
- g) Scheduled use of the three guest houses located within the confines of the project.
- h) Full-time security services.
- i) Gated entry ways (applies only to the two PUD Villages) with restricted access to those other than residents and their guests.
- j) A concierge service including chauffeur driven electric vehicle transportation to and from LaCaille Center and perhaps, the Base Station upon request.
- k) Provide professional guide services for LCC mountain adventures!

La Caille

Part Two— Little Cottonwood UDOT Gondola Amendment Request and LaCaille Base Station Alternative Proposal

Part Two - Gondola Study
and
UDOT Study Amendment Request

LaCaille Center and the LCC Gondola. As mentioned above, Lone Peak Village - Phase II is planned as corridor preservation for its potential alternative use for the gondola base station and a needed parking garage. This parcel's preservation (See Exhibit G) will allow UDOT and others the time to finalize their EIS transportation decision.

The Gondola is a key component of a regional transportation multi-modal system whereby visitors could arrive at LaCaille Base Station through pedestrian trails from neighborhoods and from locations throughout the world via the SLC International Airport. Then, using commuter rail, light rail and UTA bus services to access the Gondola, they could ultimately arrive at Snowbird or Alta without the use of a personal vehicle.

The landowners and planners of LaCaille Center and Villages have a strong desire in helping solve the transportation challenges for the future health, safety, and quality of life experience one finds in Little Cottonwood Canyon. The chosen solution to the LCC transportation dilemma needs, should to be based upon resolving **ALL** the priorities as described in the UDOT Exhibit B documents and we quote:

“UDOT’s purpose is reflected in one primary objective for S.R. 210: to substantially improve safety, reliability, and mobility on S.R. 210 from Fort Union Boulevard through the town of Alta for all users on S.R. 210.”

UDOT’s purpose includes three secondary objectives. The first secondary objective for UDOT is to consider the City of Cottonwood Heights’s goals in its Adopted Wasatch Boulevard Master Plan, which goals include provisions for all users of the transportation network: pedestrians, bicyclists, commuters, residents, and visitors.

The second secondary objective for UDOT is to consider the goals in the Town of Alta's Alta Commercial Core: Active Transportation Implementation Plan. These goals include accommodating bicycle and pedestrian use along S.R. 210, socially activating the commercial core, managing vehicle speeds, and improving safety, preserving or optimizing on-street parking, and planning for snow removal.

The third secondary objective for UDOT is to recognize the importance of the Little Cottonwood Canyon watershed to Salt Lake City's water supply and mitigate short-term impacts and minimize potential long-term transportation system impacts to water quality safe public access and keeping the vehicular Level of Service (LOS) satisfactory. The solution should also include taking into consideration the canyon's natural environment, health and capacity which we are confident will lead UDOT into determining what type of human based transportation solution is the right choice.

In summarizing the UDOT primary and secondary objectives as they relate to this Proposal, which is in support of the Gondola choice, is stated below:

- 1. Safety and Reliability.** Stabilizing and decreasing the number of vehicles including the elimination of the busses in the canyon will improve the safety of Little Cottonwood Canyon. As the Gondola glides above Highway 210 it has no interaction nor impact with surface traffic. The gondola is the best choice to accomplish this part of the primary objective. The Gondola would never need to close due to road blockages or weather thereby providing more reliability than the other choices.

As the Gondola never needs to close, a secondary emergency access/egress would always be available including when the road is closed for any length of time due to natural disasters and avalanche/snow storm closures. The Gondola is then the only option to provide a solution to ALL the stated UDOT primary requirements, "*to substantially improve safety, reliability, and mobility*".

- 2. Cottonwood Heights Wasatch Boulevard Goals.** The LaCaille Base Station design as defined below ensures ALL the City's municipal objectives for this segment of

Highway 210 are met (see attached Cottonwood Heights Wasatch Boulevard Master Plan as Exhibit H).

- 3. The Town of Alta's Alta Commercial Core: Active Transportation Plan.** Through the decreased vehicle pressure and the uniqueness of the gondola system, the Gondola meets and exceeds all the Town of Alta's objectives.
- 4. Little Cottonwood Canyon watershed to Salt Lake City's water supply.** The other options for transportation solutions include massive expansion and reconstruction of the road in LCC. The road corridor thru widening, expanding it with new travel Lanes and potential tracks bring trains, more vehicles, and busses into LCC. All these other transportation solutions will have a significant impact on the watershed.
- 5. Environmental-Air Quality.** The Carbon dioxide (CO₂) emissions generated from transportation up Little Cottonwood Canyon are significantly reduced by using the Gondola. Carbon dioxide emissions are reduced by 56% from the Gondola running 12 hours a day, as compared to 3,500 cars per day traveling the canyon. This reduction continues as more than 3,500 cars and buses travel the canyon daily.

For local air quality issues and associated pollutants, the Gondola option greatly reduces the amount of Nitrogen Gas (NO_x), Particulate Matter 2.5 (PM 2.5) and Volatile Organic Compounds (VOC). As the energy from Rocky Mountain Power to run the Gondola is consumed outside of the Wasatch Front, there are zero pollutants generated locally from the Gondola, and therefore NO_x, PM 2.5 and VOCs are removed from the atmosphere, as compared to the daily pollutants that are generated locally from the tailpipe of the thousands of cars that travel the canyon.

Attached as Exhibit 1 includes the daily emission calculations for the Gondola engines as compared to 3,500 cars daily for CO₂, NO_x, PM 2.5 and VOC.

Based upon the information described and from our perspective, the only transportation solution as defined by the UDOT range of transportation options such as a gondola, train, road widening (with avalanche sheds allowing even more cars and busses) that meets **all** of the required LCC primary and secondary needs is the Doppelmayr 3S Gondola system (See attached photographs information sheet – Exhibit J).

3S GONDOLA DETAILS

The 3S Gondola has an uphill loading capacity of 5,000 people per hour (PPH) and is by far the most cost-effective, sustainable and, as defined in Exhibit I the least carbon emitting system of the UDOT options being studied. The 3S system (3S is a German acronym and stands for three cables) provides the least invasive construction-based impact with tower-to-tower spans of more than one mile providing the final design to be canyon-impact sensitive that minimizes the physical damage to our canyons environment and protects our watershed.

The 3S Gondola uses clean, electric energy that will convey passengers above the numerous avalanche paths providing passengers with an experiential enhancement to the canyon experience – people will seek out and want to ride the gondola! The Gondola provides a healthier and far safer method of travel for canyon residents, guests, and tourists and provides an all access experience for those with disabilities. The ride will be breathtaking.

As mentioned briefly above, another crucial benefit presently lacking in LCC is that the Gondola will provide an emergency secondary egress. In the event of a catastrophic event, this egress benefit cannot be duplicated by any of the other transportation options under consideration. In no other area in the state would a dead-end street be allowed to be constructed by an average of more than a few hundred feet. We have constructed (over many years) a cul-de-sac known as Little Cottonwood Canyon Road of nine plus miles! The gondola will provide this significant safety-related problem with an emergency secondary access for residents, employees, guests including emergency medical personnel and their patient-based scenarios during severe winter storms allowing them to exit the canyon regardless of canyon closures of the past that have impacted so many.

In support of the UDOT objectives and our conclusions, we are recommending the Gondola be the choice and as such, we are preserving a base station site until the EIS decision by UDOT has been concluded. In the event that UDOT and our elected officials decide that this site works for the Gondola Base Station, and if the Gondola plan is selected as the transportation solution for LCC, then the site will not have been sold and/or developed into single family homes.

To that end, we are requesting that UDOT amend the Study defining Scenario 3B as the preferred gondola option to what we define as Scenario 3B-1 and is detailed below.

Scenario 3B-1 would be the LaCaille Base Station and the preferred location for the base terminal for the following reasons:

- 1. Gondola Canyon Alignment.** Based upon the Gondola alignment plan as attached, the LaCaille Base station works to alleviate most of the Highway 210 and 209 congestion as it draws the canyon traffic away from LCC before and past the Y-Intersection. Additionally, there will be reduced traffic congestion in the Canyon because busses cease going into the Canyon (excluding one as detailed later) which bypass the canyon at the Y-Intersection in traveling to the Mobility Hubs in Sandy and Cottonwood Heights as they pickup and drop off passengers at the LaCaille Base Station.

We recommend that for the Y-intersection, UDOT construct a signalized intersection allowing traffic and the UTA busses to make controlled left hand turns from Highway 210 and Highway 209 allowing the modified 994/953 (labeled by CW as the 973 UTA bus route and as discussed further below) to have northbound access to North Little Cottonwood Road leading to the base station.

It should be noted that under the existing Study (Scenario 3-B), UTA busses will need to travel into LCC, past or near the Y-intersection and then turnaround. Based upon a rudimentary design for the UDOT LCC 3B base station, the Busses will need to make a left hand turn, cross traffic within the canyon or UDOT will need to develop a sophisticated and very expensive (possibly a grade separated interchange) at the LCC Base Station. In order to accomodate the uphill gondola passenger, they will need to have an articulated bus (60-70 feet long) stop at this location every 1.37 minutes (44 per hour) adding to the existing traffic congestion in the Canyon at the Y-intersection.

Without significant reconstruction of Highway 210 in LCC, we do not feel it's feasible to have a bus at the LCC Station every 1.37 minutes. In our projections we have decreased the number of bus stops to one every two minutes that projects the uphill loading capacity of 2580 passengers per hour. Therefore, without a parking structure (the 3B Scenario states UDOT will not build a public parking structure at the mouth of LCC as part of that base station) to increase the passenger loading into the gondola, it seems to be under-utilizing the capacity of the planned 3S Gondola which has a 5,000 passenger per hour uphill loading capacity.

Developing the present UDOT Scenario-3B LCC base station and its Bus passenger drop off at the mouth of LCC will demand a large amount of acreage to accommodate buses and personal vehicles dropping passengers at the LCC Base Station and again, creating even more congestion at the Y-intersection. Again, we recommend that the lesser impactful LaCaille Base Station location be used for the Gondola base station as an alternative because of its many advantages.

Attached is our Gondola Alignment Map (Exhibit K). The LaCaille Station is located closer by .70 miles to the mouth of LCC by comparison to the example used in UDOTs Study Scenario-Two. This location makes the Gondola alignment more desirable and was not considered as an option in the Study as 3B-1 was previously slated to be developed into homes until January of 2020.

The UDOT Scenario-Two alignment (1.7 miles from the mouth of LCC) concerns were due to the number of homes that would need to be acquired by UDOT because the gondola's ropeway would be over the top of existing and proposed homes. Using the LaCaille Base Station site, the alignment would reduce crossing private property considerably and the number of homes could be reduced to possibly one or perhaps two.

2. UTA Transit Routing. The bussing transportation plan recommends a revision to the 994 and 953 bus routes wherein they would either continue onto each others originations points and return, stopping at the LaCaille Base Station to drop off/ pickup passengers or; terminate at the Mobility Hubs located at Big Cottonwood (6800 South Wasatch Boulevard) and Sandy Station location (9400 South and Highland Drive) and thereby cease going up into LCC.

UTA could initially use its existing 42 passenger busses and acquire the Studys recommended 84-passenger articulated busses as increased ridership demands more bus passenger capacity. The Busses would travel simultaneously between the two Mobility Hubs picking up and dropping off passengers at LaCaille Base Station.

In part of the Study, UDOT recommends electric buses be an integral part of the System. To enhance this concept, we should embrace the new technology being developed by Utah State University and a local company named WAVE. WAVE is the only company that currently offers a commercially available wireless charging system of 50 kW and 250 kW. WAVE's inductive charging systems, currently powering buses on routes throughout the U.S., are the nation's only solutions to have successfully undergone multiple rigorous commercial deployments.

The recommended 973 route (the new route between the Mobility Hubs) circulation design shows the potential routing from the two mobility hub stations whereby the busses would not need to make any left-hand turns at the LaCaille Station in order to pick up and drop off passengers. The design accommodates continuous flow of

the north, and southbound Hwy 210 travel lanes with corresponding dedicated bus pull out lanes accommodating the loading and unloading of passengers at LaCaille Base Station. The busses (and private vehicles from the parking garage) merge onto North Little Cottonwood Road and continue to proceed to the respective Mobility Hubs, (or in the case of private vehicles their own destinations) turn around and then proceed back to LaCaille Base Station and so on (see attached UTA routing Exhibit L). This modified routing will be considerably more efficient as busses traveling in both directions never interact with each other creating less traffic congestion.

Another challenge with the UDOT Study is that it recommends that a single point of bus access to the Canyon is preferred as 60% of the canyon visitors take I-215 and alternatively those travelers would have to go further along Wasatch Boulevard to get to the gondola station as compared to Study Scenario Two.

Our concern is that with 40% of the individual travelers using 9400 South (and in the States projected to grow pathway) as their canyon roadway access choice (originating from Historic Sandy Station, Draper and points south and even further west), they are being forced to travel the same extra length and impacting northbound Wasatch Boulevard to the single Mobility Hub at the mouth of Big Cottonwood Canyon, board a bus and travel backwards on the same road to the gondola station. We are confident that people will not make this redundant time-consuming trip and alternatively just drive up the canyon defeating our objective.

Therefore, we recommend that there be two mobility stations – one in Sandy and one in Cottonwood Heights - combined with the supplemental parking at the LaCaille Base Station. The LaCaille Station design allows passengers to choose which Mobility Hub (Sandy or Big Cottonwood) works best for them and then be transported via UTA to LaCaille Station.

As the Gondola alignment map shows, there are only three locations where we recommend that passengers can get onto and off the gondola – LaCaille, Snowbird and Alta although additional offloading stations have been considered. The challenge

with more on-offloading stations is that UDOT has estimated the cost for each on-offloading station is approximately \$17 million. To that end, if we create four more stops, the cost increases by almost \$68 million for, the significantly lower population that uses the four other projected stops mainly: Grist Mill, Lisa Falls, Tanners and White Pine trailheads.

Even more important than the increased costs is the projected additional travel time that takes about 5 minutes per on-offloading station. Adding more stops creates an additional time burden for the vast majority of passengers to travel in the canyon via gondola by an average of 20 minutes. Without the additional stops, the gondola travel time to Snowbird is estimated to take 30 minutes and 36 minutes to Alta. Adding another 20 minutes to the travel time will considerably decrease the passengers' desire to ride the gondola as it would then take up to an hour. Again, we project that people will just drive up the canyon and pay the toll defeating the objective of reducing canyon traffic.

As an option, and alternative to adding more on-offloading stations in the Canyon, the last part to the LCC transportation solution will be to provide a single UTA electrically powered bus that would transport the minority of the canyon passengers to the less frequented stops such as; Grist Mill, Lisa Falls, Tanner Gulch, White Pine Trailhead and perhaps the upper Albion parking lot. This bus would depart from the LaCaille Station with NO stops at the Snowbird or Alta gondola terminals and return to LaCaille. This canyon bus transportation service should be a reduced fare or free and paid for through the canyon revenues as discussed in the Study and herein. In addition to the majority of this single bus service costs being funded through the gondola operations, we recommend that the LCC public trailhead and restroom facility costs be maintained using this revenue stream as well.

3. Scenario 3B Base Station Location in LCC. The UDOT Study's 3B Gondola base station includes a gondola's base terminal building and the gondola car storage barn. If a gondola base station is constructed as described in the Scenario 3B example, it would be located at the LCC entrance and the canyon's focal point. This base

station structure would be a prominent feature and partially block the view of the glaciated formed canyon and the bells of Bell Canyon from being appreciated for their geological beauty as one arrives using Highway 210 and Hwy 209.

Our recommended 3B-1 Amendment changes the location of the building to outside of the mouth of the canyon which is then not going to impact the LCC Highway 210 viewshed as it turns the corner. Additionally, the parking garage is constructed into the shoulder of the road at and below grade off of Highway 210. Resultantly, the base station and garage will then be away from the view of the canyon's entrance and preserve the amazing visual experience one gets while turning "*the corner*" into the canyon.

4. Changing the Negative Public Input. First, we are certain that there are those who will find fault in all four UDOT proposals to resolve the LCC transportation problems. We would ask the naysayers to provide their written proposal to resolve the current and pending transportation crisis in Little Cottonwood Canyon. Second, in the written UDOT Study document, it is stated that one of the reasons that Scenario -Two was not chosen as the base station site was as a result of the developing residential area and the anticipated negative response from the public which we assume includes our future homeowners who would surround the Gondola base station and parking garage.

QRD will be the development team constructing the project's homesites and villages and will include the gondola base station details in our Master Plan. We will also include a disclosure in our CCR's that requires the homeowners and all future homeowners, prior to their purchase of a lot or home to acknowledge that the gondola and base station will be located at this site. As evidence, we will require that Buyers sign an affidavit consenting to this provision certifying not to object to nor protest the gondola during the final process and construction. This recorded provision will run with the land, in perpetuity.

Conversely, we are confident that our home buyers will want the Gondola base at this location because they will generally be drawn to the area as mountain enthusiasts who will embrace a local mountain connection that provides immediate and unfettered access to the Canyon which the Gondola will provide.

5. Signalized Intersection. As for the residents (who live on the west side of Highway 210) in our immediate area and during peak periods of canyon travel or canyon closures, they cannot exit out of their neighborhoods during these congested time periods. A new signalized intersection on North Little Cottonwood Road is planned and shown in the Master Plan. We will pay for our respective share of a new signalized intersection improvements and road dedication at LaCaille Lane and North Little Cottonwood Road. This is a community-wide benefit helping residents in the area leave their homes and neighborhoods during peak traffic periods and allows for the residents along with the 973 (or modified 994/953) busses to merge into the ROW as they return to the Mobility Hubs.

6. LaCaille Base Station Parking. Based upon our own experience and the statements from many including those referenced in the Study, transfers from cars to busses and then the gondola are a timing/value problem. As such, for those folks who feel they must park closer to the gondola station (a higher parking fee at this station is recommended) we have devised a plan for 1546 parking stalls at the LaCaille Base Station. The number of parking stalls together with the bus lanes and drop off lanes (on P1) for vehicles will significantly offset the transportation and parking needs (copy of the design is attached as Exhibit M).

To complete the intermodal hubs various methods of travel, we have included in the Master Plan an interconnecting trail system so that residents from the surrounding area can walk, run, or bike to the gondola station. Truly, this is the last piece in the regional transportation system and will complete the solution to the transportation problems and traffic congestion in LCC.

7. Mobility Hubs. We are not suggesting that LaCaille Base Station replace or even be considered as a Mobility Hub. This station would be an enhancement to the Study's 3B-Scenario making weekly parking at the Gondola base station a reality which shortens the travel time and is more desirable and efficient. Because the 973-bus route is shortened and passenger specific from only the two Mobility Hubs, the bus frequency can be increased and decreased based upon weekday, weekend and holiday passenger demands.

With 1546 LaCaille Base Station parking stalls, the number of stalls at the respective Mobility Hubs can be decreased reducing the mobility hubs' parking stall requirements and related development costs making the LaCaille parking garage expense somewhat revenue neutral.

8. LaCaille Station Loading Capacity. Using information gleaned from the Study, LaCaille Base Station will compliment the Mobility Hubs. Analyzing the bus and personal vehicle capacity (together with the 1,546 parking stalls), we estimate that the uphill loading capacity for the Gondola can be up to 4,461 people per hour (using articulated UTA Busses). If the smaller busses are used, then the number of passengers is reduced to 3,291 per hour of uphill loading as defined in our LaCaille Base Station Passenger Analysis (Exhibit N) that demonstrates the vehicle and passenger estimates.

LaCaille Base Station Parking Garage Description. The parking garage is proposed to be constructed partially upon our Property and partly into existing UDOT ROW property. In the Cottonwood Heights City Wasatch Boulevard master plan, it recommends that North Little Cottonwood Road (Hwy 210) be constructed using a two-lane road design. Taking the City's recommendation into consideration, we have used our property and UDOT's existing shoulder property to craft the LaCaille Station's parking garage design to include the recommended two lanes of traffic plus the dedicated bus drop-off and pickup lanes and a pedestrian/bikeway lane and needed walking routes that lead to the Gondola.

The parking garage top level (P1) is recommended to be constructed **at and below grade with North Little Cottonwood Road** and using the property (as shown in Exhibit G) the remaining levels shall be partially constructed into the sloping shoulder of the road. The lowest level and half of the eastern segment of the structure is planned to be below grade decreasing the remaining visual impact. The western exposure walls are recommended to be treated with exterior stone pillars.

LaCaille Lane's landscaping adjacent to the parking garage is being designed to mask the parking garage so that it is visually less intrusive to our visitors and residents. LaCaille Lane's landscaping will be similar to that of the existing private entrance off of Wasatch Boulevard.

For passengers using the northbound UTA bus, they will be offloaded and walk southerly to a pedestrian escalator and tunnel taking them beneath North Little Cottonwood Road and into the parking structures second level (P2). The Gondola platform will then be accessed via an escalator. The southbound passengers will arrive at the same level as the Gondola platform (P1) and have unobstructed walking access without crossing North Little Cottonwood Road to the Gondola.

On a side note, the Master Plan as shown will be revised to recommend that the Bonneville Shoreline Trail be connected via a Hwy 210 tunnel to minimize pedestrian traffic as they desire to connect into the other area trail systems.

9. Financial Concepts and Strategies. The development costs for LaCaille Center and Villages will be through private funding sources.

For the Gondola costs, we expect that this project, like any other transportation project in the State of Utah, will be funded through legislative resources although some of the ongoing gondola revenues generated could provide a source for retiring a por-

tion of the potential transportation bond used for acquisition and development costs.

For the ongoing administrative and operating costs, we believe the following will be more than adequate to cover those costs. The gondola revenues sources are listed below:

- a) Gondola ticket sales
- b) Tolls specifically from vehicles using LCC road
- c) Fees from parking in garages
- d) Ongoing contributions from Alta and Snowbird resorts for season pass holders and their employees
- e) Lease revenue at the base, mid and top terminals
- f) Advertising and naming rights, etc.
- g) Other ongoing government or quasi-government contributions

10. Miscellaneous. In addition to the loading platform, the Station itself will have small vendor spaces accommodating ticket sales, information, viewing platforms, ski/board rentals, a bistro coffee/food service and outside visitor seating on the southwestern edge of the parking structure and of course loading-queuing areas. For most visitors, similar to comparable Gondolas, riding it will be an experiential enhancement permitting them to have a unique and enjoyable experience that will be far more eventful versus a ride up LCC in a personal vehicle or bus.

La Caille

Conclusion

Conclusion

The QRD team of Vendors is comprised of highly motivated and professional individuals and corporations that deeply care about LCC and are in part:

- ❖ CW Management
- ❖ Snowbird
- ❖ Beecher Walker Architects
- ❖ Blu Design
- ❖ Ensign Engineering
- ❖ Numerous others along with our elected officials.

To that end, we have made more than 60 presentations to various groups and elected officials who have asked us to convey their thoughts as listed in the following notable quotes:

- a) *“When the conversation of a gondola came up, I was skeptical, but after seeing this idea, I am a believer”*
- b) *“I love this concept”*
- c) *“A transportation solution for Little Cottonwood Canyon is a generational decision. We must support the Gondola option to preserve the canyon for generations”.*
- d) *“Outstanding!”*
- e) *“This gondola idea resolves all of the major issues facing the canyon today—water, traffic, access and preservation, who is going to object?”*
- f) *“The gondola will provide experiential enhancement to the canyon.”*
- g) *“Love the gondola!”*
- h) *“Adds a lot of pizazz to the canyon”*
- i) *“We ARE going to do something, lets pick the best something.”*

- j) *“This project has the vision to properly prepare the canyon for our population, that doubles by 2050.”*
- k) *“The costs and solutions as presented balance the needs for all time.”*
- l) *“we have talked about it (the Gondola), We have studied it and now its time to do it!”*

We are certain that LaCaille Center and Villages in concert with the Gondola including the LaCaille Base Station will be a complementary addition to not only the Little Cottonwood Canyon and its surrounding community and also the crowning jewel of the regional transportation solution for the Wasatch Front.

Our requested LaCaille Base Station Amendment named Scenario 3B-1 will not detract from UDOT’s Scenario 3B, but rather become an enhancement to the overall objective of providing canyon enthusiasts parking, providing the safest, most reliable and accessible alternative being studied by UDOT through the EIS process. The gondola will provide the least amount of travel time and create a smoother transition for the UTA bus movement to and from the respective Mobility Hubs.

Scenario 3B-1 also takes into consideration the growing population of 40% of travelers coming from the southern part of Salt Lake County and even farther along 9400 South providing less congestion at a single Mobility hub location as defined in the Study.

In the final analysis, the Gondola is the only proposed transportation solution that further protects the canyon from invasive surface road widening or rail tracks, it’s also the only solution to the emergency egress problem, it’s the only solution that completely eliminates the potential impacts from canyon closures due to avalanches and it further protects our watershed by minimizing cars and busses in the canyon – ***the Gondola, quite frankly, is the solution!***

The concluding gondola benefit, and what some feel is the most important part of this proposal, is that if the gondola is approved and constructed, Snowbird has tentatively agreed

to, in concert with the Gondola being completed, provide a conservation easement for all the property they currently own north of Highway 210. This easement would prevent, in perpetuity, the chance that it could ever be developed into a traditional ski area with mechanized lifts. The area they own in whole or part includes property in Mount Superior, Flagstaff Mountain, Shoulder and Gully, Toledo Bowl and Cardiff.

To memorialize Snowbirds open space commitment, Snowbird has provided a letter to that affect. Both Snowbird and Alta are supporting this proposal and their individual letters are attached as Exhibit O.

Please note that elements of this proposal can change at any time, without notice due to unforeseen circumstances and governmental approvals. We will be available for a tour of the site to interested individuals to discuss our proposal and its recommended amendments to the Study.

Collectively we can create a solution to a long-standing problem and leave the future with something extraordinary!

Sincerely,

Quail Run Development LLC

Wayne Niederhauser

Chris McCandless

Exhibit D—Forest Service Carrying Capacity
Questions and Answers Sheet

U.S. Forest Service Uinta-Wasatch-Cache National Forest

Overview

The Utah Department of Transportation (UDOT) is currently preparing an Environmental Impact Statement (EIS) for transportation and mobility improvements along SR-210 in Little Cottonwood Canyon. UDOT, through assignment from the Federal Highway Administration, is the Lead Agency for the Little Cottonwood Canyon EIS, and the USDA Forest Service is a formal Cooperating Agency. To date, and throughout the UDOT Little Cottonwood Canyon EIS process, various agencies, non-governmental organizations, and the public have asked questions related to the Forest Service management of visitors on National Forest System lands. In an effort to clarify Forest Service regulations, policies, and procedures associated with the management and monitoring of visitors on National Forest System lands, the Forest Service has prepared the following answers to some of the common questions that have been received during the UDOT Little Cottonwood Canyon EIS process.

Questions and Answers

1. *Does the Forest Service have the authority to set carrying capacities and limit access to National Forest System lands?*

Yes. The Forest Service has authority to regulate occupancy and use of National Forest System (NFS) lands under the Organic Act of 1897 (16 USC 551). The Act provides the Secretary of Agriculture with the authority to make rules, regulations, and establish service that ensures the protection of NFS lands, in accordance with the purposes for which the lands have been reserved, namely, to regulate their occupancy and use to preserve the forests and reduce forest degradation.

2. *Are there provisions in the 2003 Wasatch-Cache Revised Forest Plan that address acceptable carrying capacities on lands within the Uinta-Wasatch-Cache National Forest?*

Yes. The 2003 Wasatch-Cache Revised Forest Plan acknowledges that the tri-canyon area, including Millcreek, Big and Little Cottonwood canyons, provides a wide array of recreational opportunities designed to serve a large and growing urban population, while maintaining stable watersheds, water quality, and ecological integrity of the land, its physical resources, and its biological communities. The Plan directs Forest decisions responding to increasing recreation demands, to give first consideration to desired water quality and riparian conditions. In specific regards to wilderness, the Plan directs the Forest Service to control and reduce the adverse impacts of human use through education and minimum regulation. The Plan also indicates that the Forest Service will not allow crowding and physical impacts from visitor use to reach levels where solitude is destroyed, or evidence of humans dominates.

Through its implementation of the Forest Plan, the Forest Service closely monitors use levels on National Forest System lands to preserve forest resources and protect wilderness characteristics. The Forest Service acknowledges that in the future, management may be

needed to limit resource impacts from user visitation. The Forest Plan indicates that such management options may include, but are not limited to, use capacity analysis, allowed use limits and quotas, permit systems, designated camp sites, wilderness management plans, and/or amendments to the Forest Plan.

- 3. Will the Uinta-Wasatch-Cache National Forest evaluate carrying capacities and potentially limit access to National Forest System lands to protect forest resources and the quality of recreation experiences?***

Specific carrying capacities are not being considered at this time. Through its implementation and monitoring of the management protocols and objectives in the Forest Plan, the Forest Service has determined that many areas on the Uinta-Wasatch-Cache National Forest may handle increased use, without significant resource impacts, and while maintaining quality recreation experiences for visitors, with the construction and sustained operations and maintenance of infrastructure designed to accommodate current and future visitor demands. The construction and sustained operations and maintenance of infrastructure may greatly reduce visitor impacts to natural resources in some areas through controlled access, improved trails, proper toilet facilities, safe parking, etc.

The Forest Service acknowledges that future continued growth in metropolitan areas and communities adjacent to the Uinta-Wasatch-Cache National Forest may require additional management measures to limit resource impacts from visitor use. Currently, the Forest Service focus is to improve and maintain infrastructure to meet current user demands, and it is not considering specific carrying capacities for areas based solely on the limiting factors of its existing infrastructure.

- 4. How does the Forest Service monitor human impacts to forest resources, and what actions could the Forest Service take to mitigate impacts?***

The 2012 Planning Rule (36 CFR 219), guides forest plan monitoring across the Forest Service, and is intended to monitor human and other potential impacts to the forest, and identify necessary changes to the Forest Plan, management activities, monitoring program, and/or needed assessments to evaluate mitigation measures. The monitoring results and recommendations are presented in a *Forest Plan Biennial Monitoring Report* that is available to the public. The monitoring program focuses on several key areas, including but not limited to, assessments of visitor satisfaction, forest access, watershed conditions, fire management and fuels reduction, ecosystem health, land use, and forest Special-Use Permits. The forest may implement a wide variety of management actions to mitigate impacts identified in the *Forest Plan Biennial Monitoring Report*, which may include limiting access to impacted areas and/or resources.

- 5. Does the Forest Service consider the lack of solitude on National Forest System lands a degradation of the quality of the recreation experience, and therefore a reason to limit access?***

Recreation visitors to the Uinta-Wasatch-Cache National Forest experience a moderate to high level of responsible interaction with other users as a price they are willing to pay for ease and convenience of access from the urban setting. There is a diverse, and sometimes

conflicting range of individual visitor expectations for recreation experiences and amenities across the forest. Solitude is only one of many criteria that must be considered and evaluated by the Forest Service, and typically will not be the only criteria which would prompt the Forest Service to limit access to an area. The Forest Service's recreation strategy is to balance provision of recreational amenities and opportunities with natural and financial resources.

6. *Does the Forest Service set the carrying capacity of ski areas on the Uinta-Wasatch-Cache National Forest?*

No. The National Ski Area Permit Act of 1986, as amended by the Ski Area Recreational Opportunity Enhancement Act of 2011 (16 U.S.C. 497b), directs the Secretary of Agriculture to permit acreage sufficient and appropriate to accommodate the permittee's needs for ski operations and appropriate ancillary facilities, as determined by the Secretary, and does not explicitly direct the Secretary to set visitor capacity limits for the permitted acreage. Management of visitor experience and safety is the responsibility of each respective ski area, and is reflected in their Master Development Plan, required by the standard Forest Service Ski Area Term Special Use Permit, and their Operating Plan that outlines the ski area's responsibilities for protecting public health, safety, and the environment and for ensuring delivery of high-quality services (FSM 2341.1 and 2343.13).

7. *Why doesn't the Forest Service build more trails and trailheads to reduce the demand and impacts on existing trails and trailheads?*

While additional trails and trailheads may decrease visitor densities in other areas of the forest, new trails and trailheads have the potential to cause additional impacts on watershed conditions and other forest resources, and require additional infrastructure, operations, and maintenance to mitigate impacts. Proposed trails and trailheads must also be planned in regards to their purpose and benefit to the overall forest trail system, and ability to meet increasing demand, while maintaining desired watershed conditions and balancing expectations for various types of recreation opportunities. The forest faces challenges in sufficiently funding the evaluation, planning, construction, and ongoing operations and maintenance of existing and new trails and trailheads. The Forest Service meets this challenge by leveraging partnerships with local, state, and federal agencies, partners, and private enterprise to develop recreational facilities on and off the forest that provide for a range of recreation opportunities (e.g. camping and picnicking areas, trailheads, and interpretive sites). New trails and trailheads on National Forest System lands are planned and constructed in a sustainable manner for the forest.

8. *Why doesn't the Forest Service build more parking and keep parking areas open year-round to accommodate visitor demand?*

Protection of watershed conditions is a primary factor in managing roads, trails and access on the Uinta-Wasatch-Cache National Forest. The 2003 Wasatch-Cache Revised Forest Plan contains policies and directives for the management of watersheds in the tri-canyon area, including Millcreek, and Big and Little Cottonwood canyons. The Forest Plan limits parking capacities on National Forest System (NFS) lands in the tri-canyon area, including ski areas, summer use homes, developed and dispersed recreation sites, to not exceed year-2000 levels,

unless modification is needed to enhance watershed protection or to facilitate mass transit. Although parking on NFS lands may periodically be consolidated and formalized to enhance safety and protect forest resources, the Forest Service has attempted to manage the overall parking capacity in each canyon to year-2000 levels in accordance with the Forest Plan.

Several parking areas on NFS lands are closed during the winter months. This is typically due to the fact that the parking areas are associated with recreation areas and sites that are closed for the winter season, including associated infrastructure such as toilet facilities, picnic areas, garbage collection sites, etc. Although some of these areas may provide year-round access to trails and backcountry areas, the Forest Service does not operate and maintain the areas during the winter season due to higher operation and maintenance costs, and limited winter season staff. Additional funding sources and partnership opportunities may have an influence on the future management and operational seasons of these areas.

9. *Is the standard amenity fee, being proposed by the Forest Service at some sites on the Uinta-Wasatch-Cache NF, intended to limit access to those sites?*

No. The Uinta-Wasatch-Cache National Forest is proposing to implement a standard amenity fee at select sites, in accordance with its authorities under the Federal Lands Recreation Enhancement Act (REA). The purpose of the proposal is not to limit access to recreation sites on National Forest System lands, but to address the increase of forest visitation and associated demand for amenities and recreation opportunities. Increased use is impacting forest resources, visitor experience, and affecting the forest's capacity to manage a quality recreation program.

Funds generated from the REA sites will be used to conduct maintenance activities such as providing clean and functional restrooms, maintaining picnic tables and informational signs, increasing law enforcement presence, and keeping the sites free of trash. The Forest may also use REA funds to repair damages to the natural resources from visitors, repair and maintain trails, and hire Forest Protection Officers that would be responsible for the safety of forest visitors and their vehicles, thereby reducing vandalism on the forest, and educating visitors about forest rules and regulations, and enforcement.

10. *One of UDOT's objectives for the Little Cottonwood Canyon Environmental Impact Statement is to increase vehicle occupancy in Little Cottonwood Canyon, which inevitably may lead to more people visiting the Canyon. How will the Forest Service manage this likely increase of visitors to the Canyon?*

The Forest Service is a cooperating agency assisting UDOT during the development of the Little Cottonwood Canyon (LCC) Environmental Impact Statement (EIS). One of UDOT's primary objectives for the LCC EIS, which stems directly from Utah Senate Bill 277, which establishes the eligibility of the project for funding, is to mitigate traffic congestion in LCC. To meet this objective, UDOT is evaluating alternatives that include increasing vehicle occupancy and facilitating public transit within the Canyon. Although it is not UDOT's intent to increase visitors in the Canyon, it is likely that by facilitating transportation, combined with growing recreation demands, more people will visit the Canyon.

The proposed alternatives that UDOT may evaluate in the EIS are anticipated to be implemented within UDOT's existing easement for State Route 210, or otherwise on lands that will be appropriated for highway use by the Federal Highway Administration (FHWA). As a cooperating agency, the Forest Service will participate in the EIS process and will advise UDOT and the FHWA on potential impacts to National Forest System lands and forest resources that may need to be considered and evaluated in the EIS, in accordance with the 2003 Wasatch-Cache Revised Forest Plan and the Federal-Aid Highway Act (23 USC). The Forest Service will collaboratively work with UDOT and other cooperating and participating agencies to develop mitigation measures, as necessary, which will permit UDOT to successfully meet the objectives of the project and Senate Bill 277, while ensuring the protection of National Forest System lands and forest resources.

11. How would the Forest Service evaluate a carrying capacity study?

As described in Item 3, above, the Uinta-Wasatch-Cache National Forest is not considering specific carrying capacities at this time. If, through monitoring of the management objectives in the Forest Plan, the Forest Service determines that visitation and use is adversely impacting forest resources, and the mitigation of such impacts is not feasible through standard adaptive management practices, the Forest Service may decide to perform a carrying capacity or similar study for a specific area or areas. Alternatively, if an individual, group, or entity decides to undertake a carrying capacity study for National Forest System lands, they may do so and formally submit the study as a proposal to the Forest Service. A carrying capacity study would need to address several factors to accurately demonstrate the need, methodology, monitoring/enforcement, anticipated efficacy, environmental justice concerns, and other factors to adequately support a proposal for Forest Service consideration. In either scenario, the Forest Service will first evaluate if the proposal demonstrates a valid purpose and need, and is consistent with Forest Service policies, regulations, and authorities. Pending a positive outcome of this initial evaluation, any proposed management actions will be analyzed in accordance with the Forest Service NEPA process, including formal public comment and objection periods. The Forest Service NEPA process will also be used to analyze any necessary amendments to the Forest Plan required to implement the proposed management actions. Based on the results of the NEPA analysis, the Forest Service may make an informed decision on whether to implement all or parts of the proposed management actions.

WASATCH BOULEVARD

Master Plan

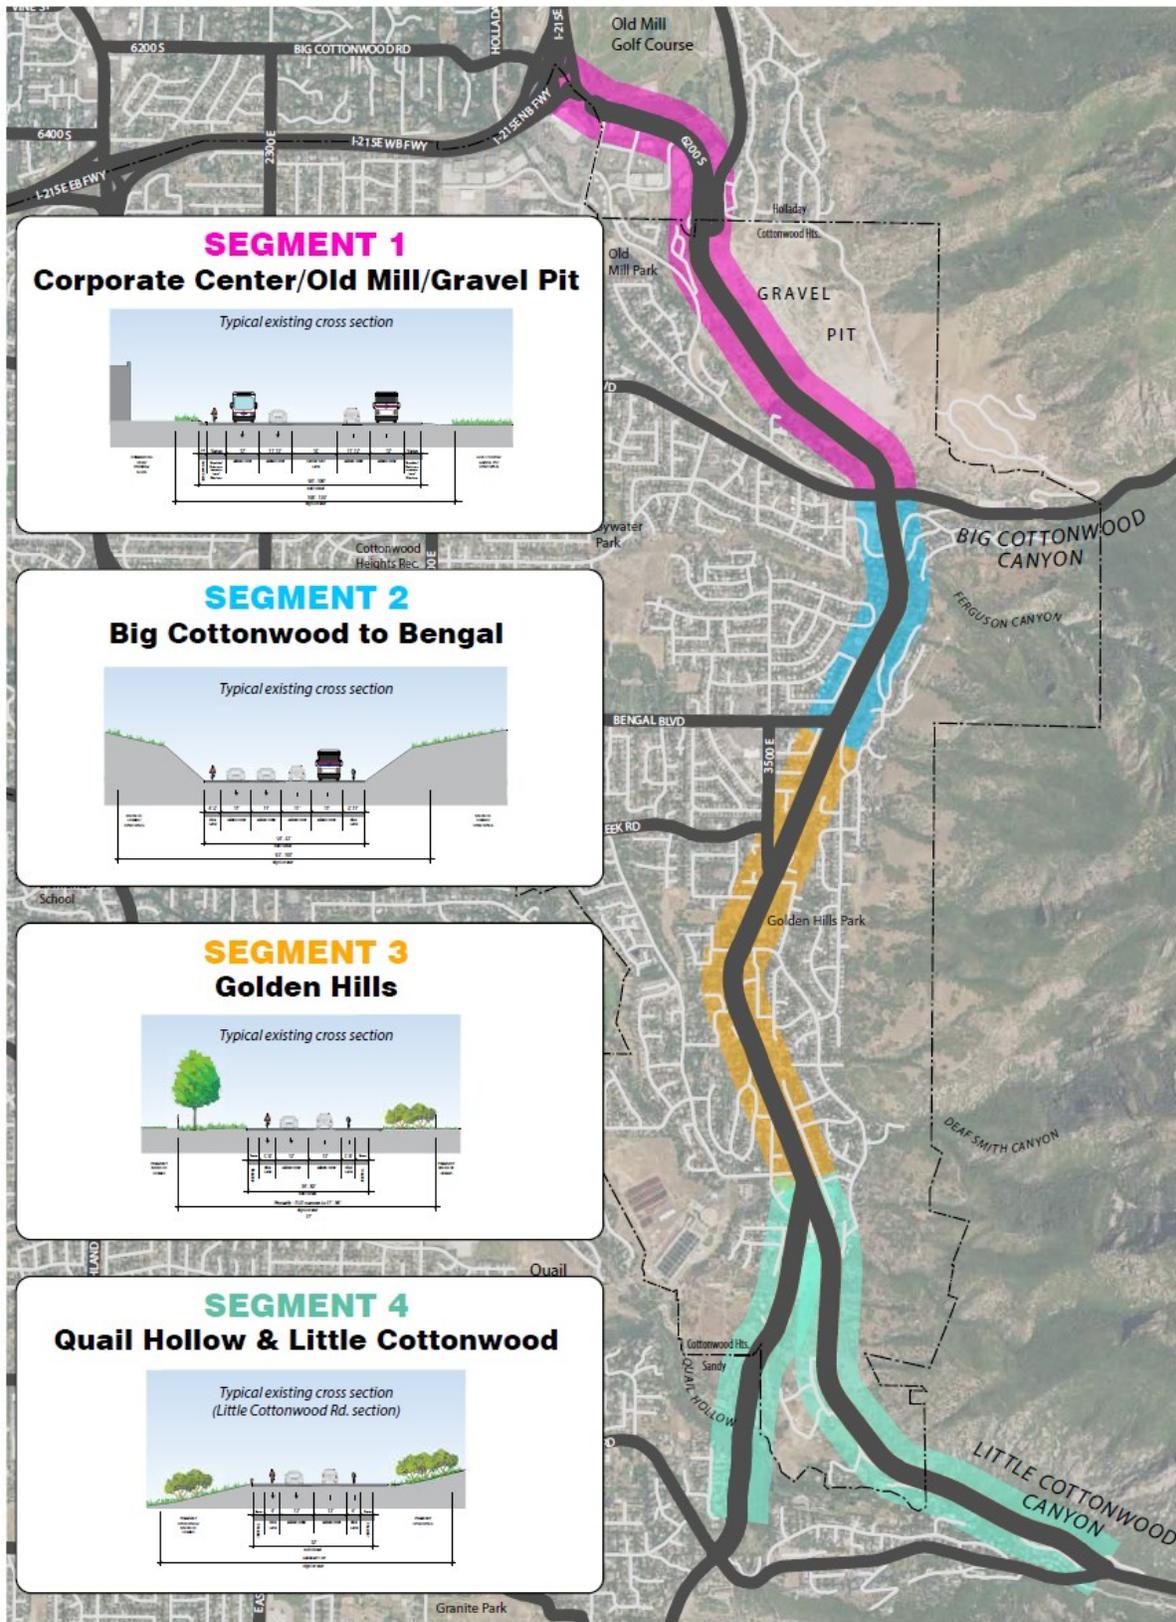

July 2019

WASATCH BOULEVARD CORRIDOR GOALS

- 1 | Preserve and enhance the character and livability of existing residential neighborhoods.
- 2 | Move people through the corridor reliably.
- 3 | Increase safe travel choices along the corridor.
- 4 | Enhance opportunities for recreation along the corridor.
- 5 | Preserve and enhance the scenic and natural qualities along the corridor.
- 6 | Promote and prioritize sustainable solutions to Wasatch Canyon access at a local and regional scale.
- 7 | Identify potential land uses and locations for new development or redevelopment along the corridor.

Sustainable Mobility. Proven Technology.

The undertaken Life Cycle Assessments show that the urban ropeway is the eco-friendliest mobility solution in comparison to alternative transport systems. Based on the "Línea Roja" in La Paz (BOL) the well-known consultant institution denkstatt GmbH conducted a LCA-study for both existing transportation systems ropeway and bus as well as one for a fictional tram. All Life Cycle Assessments had been undertaken according to ISO 14040/44 and were reviewed by three independent institutions.

Study | denkstatt GmbH (2019): Carbon Footprint of a Doppelmayr Cable Car in La Paz, Placed in the Context of Select Alternative Transport Systems.

The underlying scenario¹ is characterized by a height difference of 402 meters and would only have been possible by bus or tram over a distance of 12,4 kilometres. With the mobility solution "ropeway" the decision-makers considered to use a new level which directly connects both stations over a distance of 2.349 meters without any traffic jams. Apart from the positive effect on the travel time, a trip only takes 10 minutes – passengers of the ropeway system profit from continuous availability of cabins which eliminates waiting time for users.

With the proven ropeway technology in urban mobility we help cities in reaching UN Sustainable Development Goal "11. Sustainable Cities and Communities" to maintain the quality of life for current and future city dwellers. The urban ropeway as an easily integrable, interconnected and reliable solution in urban mobility promotes:

Decarbonization of Cities

- No local pollution such as nitrogen oxides (NO_x) or particulates
- Low environmental impact due to smallest physical footprint to alternative mobility solutions
- Central Electric Drive: Highest Energy Efficiency

Environmentally friendly mobility solutions to increase the general quality of life in cities

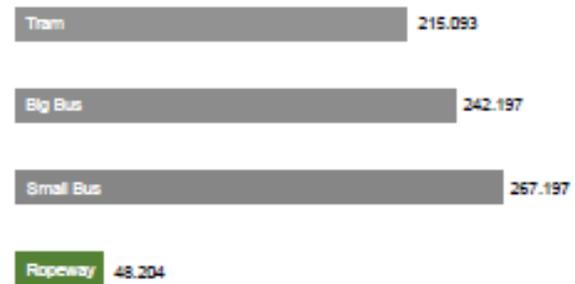

- Livability: Higher air quality (no fumes) and low in noise
- Lowest land sealing through easy integration in existing infrastructure
- Preservation of buildings, parks, and memorials

Accessible mobility without any limitations

- Barrier-free entrance and exit
- Continuous availability of cabins (no waiting) for up to 6.000 passengers per hour and direction
- Cost-effective implementation and operation enable socially acceptable pricing for users

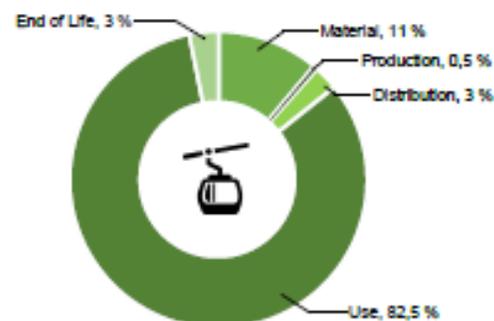

Life Cycle Assessments

of various means of transport (in tCO₂eq)

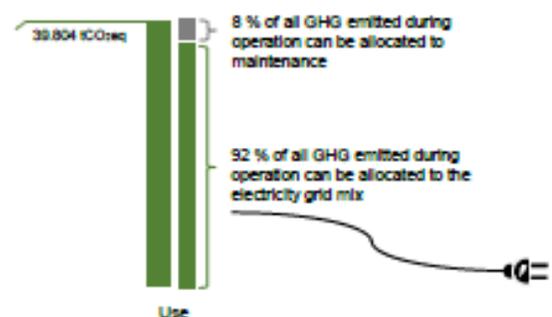

Greenhouse Gases allocated to Life Cycle Phases

LCA of urban ropeway "Línea Roja" (Cradle to Cradle)

Operation of Urban Ropeway (Use)

Divided into electricity grid mix and maintenance

La Caille

Exhibit N—LaCaille Base Station and Gondola Passenger Analysis

Little Cottonwood - LaCaille Station Parking and Gondola Passenger Analysis

Draft - For Discussion Purposes Only - April 26, 2020

Bus Capacity:	PPB	TPH (both routes)	PPH	Peak Period
UTA 973 Route	45	30	1350	4050
UTA Articulated Busses (973)	84	30	2520	7560

Other Transit:	Stalls	Passengers	Per Day	Peak Periods
LaCaille Station Day Use	1364	2.2	3751	3751
Short Term	171	2.2	752.4	752
Drop Off Only	11	2	660	1320
Total Other:	1546			5823

Estimated LaCaille Station to LCC Passengers on Gondola (Per Hour) Capacity: 4461

Note: The Gondola, in concert with in-canyon vehicle tolling, can be used to limit the number of daily visitors. When the Canyon reaches its “human capacity” management simply doesn’t load new passengers until the human population decreases to the acceptable level.

To Whom it May Concern,

Alta Ski Area is an avid supporter of transportation solutions that will accommodate growth, reduce congestion, and improve safety, reliability, and access to recreational opportunities in Little Cottonwood Canyon. We have reviewed CW Management Corporation's Little Cottonwood Canyon Gondola Proposal and in concept, strongly support their proposed gondola. Their proposal reflects a thorough understanding of the transportation issues in Little Cottonwood Canyon and a thoughtful, well-designed solution that will address many of the issues we have struggled with for years in Little Cottonwood Canyon.

The transportation and safety issues that have beleaguered visitors to Little Cottonwood Canyon for decades have been magnified during the past two years due to increased demand from growth within the Salt Lake Valley and multi-resort passes. Visitors have been frustrated by multi-day canyon closures during the summer and winter months due to acts from Mother Nature that have closed the road and economically impacted businesses in Little Cottonwood Canyon. The proposed gondola would provide badly needed additional ingress/egress, improve public safety and improve the visitor experience.

From our environmental stewardship focus, Alta Ski Area recognizes that a gondola solution minimizes the immediate and long-term impacts upon the environment better than other transportation solutions. We also recognize that a gondola solution will provide backcountry and other non-ski area visitors an alternative mode of travel when ski area parking lots are full.

Currently, there is limited parking within the Town of Alta for backcountry visitors and most of the terrain on the North side of Little Cottonwood Canyon is owned by Alta or Snowbird. The proposed gondola will reduce pressure on the limited parking within the Town of Alta and facilitate the development and implementation of solutions that preserve public access and use of private lands on the North side of Little Cottonwood Canyon West of Grizzly Gulch.

We strongly recommend the gondola transportation solution proposed by CW Management Corporation be thoroughly analyzed and considered. It is our opinion, that this transportation solution addresses the current and potential future transportation issues in Little Cottonwood Canyon better than any other alternative explored to date.

Thank you,

Michael R. Maughan
President and General Manager
Alta Ski Area

ESTABLISHED 1938

June, 2020

To Whom It May Concern,

We are writing to voice our support for a gondola, and particularly the alignment and configuration proposed by CE Management Corp., as a means to solve the transportation problems facing Little Cottonwood Canyon. The decades-long problem of putting thousands of vehicles on a steep, two-lane road with one of the highest avalanche hazard indexes in North America has only compounded with Utah's population growth.

As lifelong Little Cottonwood Canyon skiers, we can attest first-hand to the need for improved transportation. Since we were children first skiing the world's best snow and terrain, the fundamental issue of SR 210 performing only as well as Mother Nature or poorly equipped vehicles and drivers will allow has not changed.

In the last year we have seen the implications of unexpected and multiple-day canyon closures, both in summer and winter. The business interruption pales in comparison to the risk to human life in the immediate moments of avalanches and rock slides but also the extended impact of no ingress or egress from the box canyon.

We have long supported a gondola as a means to address the greatest number of issues presented in the Utah Department of Transportation Little Cottonwood Canyon EIS. However, the thoughtful concept coupled with the key land acquisitions by CE Management Corp. has presented what we feel is an ideal solution to a generational problem.

Snowbird and the other Cottonwood Canyon ski resorts were instrumental in the creation of the UTA Ski Bus service, Park n Ride lots and have historically paid for the UTA Ski Bus fares of employees and season passholders. We envision a similar funding model if a gondola were in place.

The impact on our planet of removing thousands of vehicles per day from the canyon is also a significant factor in our support of a gondola. We do not believe vehicles are the answer to the Little Cottonwood Canyon transportation problem.

In the event a gondola is chosen and implemented, Snowbird is willing to work with local or national organizations to place our private land outside the ski resort boundary previously intended to be used in the Central Wasatch Commission federal lands bill into a conservation easement for their permanent protection.

Thank you for your consideration of a gondola transportation solution for Little Cottonwood Canyon.

Sincerely,

snowbird.com

1. The gondola is a safer, more reliable transportation system despite the canyon weather conditions.
2. Regardless of the reasons for the Highway 210/road closure status, such as avalanches, natural disasters and vehicle accidents, the Gondola will always be open for passenger transportation purposes.
3. The gondola has the smallest physical footprint versus the other transportation solutions under consideration.
4. Reduces the number of vehicles and can remove ALL the busses in LCC.
5. Most environmentally friendly option as compared to the carbon-based alternatives.
6. Using the LaCaille Base Station model, the uphill passenger capacity is about 4,500 people per hour (using the parking garage to supplement the bus capacity).
7. Provides a pedestrian friendly access to the gondola base station through new trail systems decreasing the immediate area's need to use personal vehicles.
8. Further protects the LCC watershed through projected reduction in vehicles.
9. No needs to expand Highway 210 into a larger right-of-way that would increase the vehicle count within the canyon.
10. The cost of the Gondola system is by far the most cost effective and has the longest life cycle of any of the proposed alternatives.
11. Completes the regional transportation system so that citizens and tourists can gain access to LCC from various points of the Wasatch Front without using personal vehicles.

Lastly, the gondola provides the means, if constructed whereby Snowbird who owns of over a thousand acres on the northern side of Highway 210 (Mount Superior, Flagstaff, Toledo Bowl and Cardiff) will grant a conservation easement on this cherished property and preclude any future development from occurring. A letter from Snowbird is attached in the Proposal as Exhibit O to verify this commitment.

Thank you for taking this proposal into consideration and we are always available to discuss the details as questions arise in addition to being available for an on-site tour to those you deem appropriate.

Hello Josh,

I hope you are the right person to be contacted regarding Cottonwood Canyons development proposals and discussions.

Please see my correspondence with the Boring Company below. They are the only innovative tunneling company who can provide inexpensive but effective solution for \$10 million a mile.

Tunnels could be a perfect transportation and emergency escape solution that is safe from wildfires, avalanches or any surface emergencies.

Because they are inside they are not affecting beauty AND the wildlife of the Canyons. They have huge throughput and are the safest from earthquake events.

Other proposals (like gondola or rail or extra road) are not viable, more expensive and not effective.

I have Masters degree in transportation engineering and understand this issue well. Please keep me in the loop of the conversation.

Best Regards,

Leo Balitskiy

Hi Leo,

Nice to hear from you.

We are not aware of this project, but it sounds like something The Boring Company could possibly help with to ease the traffic congestion described in the article. If you'd be interested in connecting us with Josh, we'd be open to discussing the possibility of submitting a proposal.

Thanks,
Mike

Hi,

Could you put together a very rough estimate of the cost of a twin tunnel system for this route? It is between Salt Lake City International Airport (at mile 0, not on illustration below) and Alta, and Solitude/Brighton. Specifically between the turn just beyond mile 20 to Park City/Brighton. Additional cost to extend up to I-80 (mile 11), and additional cost to extend to SLC

Proposal at: <https://www.dropbox.com/s/g0bjoposmk30a1g/Little%20Cottonwood%20Canyon%20-%20Boring%20Company%20tunnels%20proposal.pdf?dl=0>

There are two Virtual Public Meetings about the Utah DOT EIS draft alternatives tonight (22-Jun-2020 at 18:00-20:00 MDT and 23-Jun at 18:00-20:00 MDT). <https://littlecottonwoodeis@utah.gov>

Hi,

I attended the Utah DOT Little Cottonwood Canyon EIS virtual meeting last night. It appears to me that a Boring Company constructed system could fill all their needs in a superior fashion. I've also been involved with the Facebook UDOT LCCEIS group. Snowbird, Alta, Solitude, Brighton, Park City, Deer Valley, and Cottonwood Canyon are all in the post below. This could generate significant revenue for you all, worth looking at the numbers. You could call the joint company Cottonwoods Express LLC. Google "Hornsedale Power Reserve" for tonight's meeting.

Best regards,

Dave Stein

Eric Dorsey Mark Allen not just a resort issue as now BC access is blocked to the public from poor traffic management from UDOT
Like · Reply · 8h · Edited

David Stein 🙌 The Cottonwoods Express proposal, if implemented including a Big Battery (like the Hornsdale Power Reserve) will pay for itself (in a few years) and cover its own operating expenses (without charging fees to users). The Hornsdale Power Reserve (in millions of AUD at \$1AUD = approx. \$0.69USD) made its owner, Neoen, \$30 in 2018, \$34.5 in 2019, and \$36.3 in just Q1 2020 (a tornado took out an interconnect, unusual event). That's AU\$100.8 in 2.25 years, approx. US\$69.5 million which could pay off the Cottonwoods Express capital costs in an acceptable time frame. (From a [PV-magazine-australia.com](#) article on the Hornsdale big battery)

The HPR big battery cost AU\$50M (about US\$34.5M) to build at the end of 2017 and was constructed in just 55 days. Prices have come down a bit since then due to battery price improvements and Tesla Powerpacks being improved on by the newer Megapacks for this kind of application.

After it pays for itself it would actually make the owner money, for the foreseeable future. Heck, the resorts could form a joint company to build and operate it with each owning a share of it. They would be motivated by the improvements it would bring plus the income potential. Are you listening, Snowbird, Alta, Solitude, Brighton, Park City, and Deer Valley? The big battery part could be built first and start generating money immediately. They could even tell the Utah DOT that they'll handle it if the state just cooperates on permitting and approvals, no changes needed to S.R. 209. Just help with stations parking siting and locating. I'm working on developing a proposed route to include all Available Mobility Hubs locations from the LCCEIS document. I'll send it to The Boring Company later today.

To: tunnels@boringcompany.com

Cc: littlecottonwoodeis@utah.gov, David Stein <[REDACTED]>

Hi,

Note: The current Utah DOT three draft alternatives and their price tags (in millions):

Enhanced Bus w/no widening of S.R. 209 - \$283 & annual O&M \$9.0

Enhanced Bus with widening of S.R. 209 - \$470 & annual O&M \$6.2

Gondola w/bus from mobility hub - \$393 & annual O&M \$4.5

Comparison with Boring Company tunnels:

1. More buses without road widening – Very limited capacity. Wait times until bus fills up, or underutilization. Limited operation schedule. Subject to storm and avalanche delays or closures. Limited capability for transporting lodging guest belongings. Impossible to extend to other resorts. Increased fleet maintenance and depreciation costs. Still based on fossil fuels unless CNG or EV buses used. Slow. Expensive.
2. More buses with road widening – Very limited capacity. Wait times until bus fills up, or underutilization. Limited operation schedule. Subject to storm and avalanche delays or closures. Subject to extra lane “poaching” by scofflaws. Poaching would adversely affect time advantage. Anti-poaching capital and operational expenses. Increased road maintenance expense. Increased plowing costs. Environmental costs of expansion project. Limited capability for transporting lodging guest belongings. Impossible to extend to other resorts. Increased fleet maintenance and depreciation costs. Still based on fossil fuels unless CNG or EV buses used. Slow. More expensive and longer construction timeline.
3. Gondola – Very limited capacity. Impossible to extend to other resorts. Impossible to extend to airport. Subject to avalanche damage or closure. Very limited expansion capability. No real capacity to transport lodging guests with their luggage. Relatively slow. Expensive.

Re: Little Cottonwood Gondola / Mass Transit System EIS

Dear UDOT, and all others it may concern.

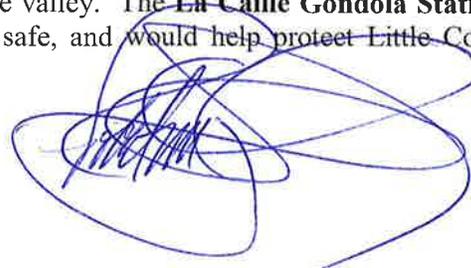

Solving the needs for travel in the big cul-de-sac of Little Cottonwood Canyon has become easier with the plan to use gondolas from the **La Caille Gondola Station** next to North Little Cottonwood Road. See **Scenario 3B-1 of the UDOT Gondola Feasibility Study**.

Environment. The gondola plan seems the most forward thinking and responsible solution in many ways. Probably the most compelling benefit of the gondola plan, to me, is protection of the canyon environment. Its impact on the canyon for installation and operation would be minimal compared to the road expansion and construction needed to accommodate a large number of buses. The electric powered gondola system would not only be cool; it would be clean. The gondola plan would protect air quality -- which would in turn benefit the trees, other vegetation and wildlife, and especially the important water resources represented by snow accumulation and Little Cottonwood Creek.

Safe Travels. A top reason for adopting the gondola plan is that it would allow for reliable and efficient transportation up and down the canyon *even when the roads are impassable*. The gondolas would be safe in storms, and after avalanches, slides or other natural disasters. And, gondolas would offer an important and efficient benefit in emergencies. In contrast to the expensive/risky option of flying helicopters in the canyon in stormy conditions, the gondola would already be in operation, and would reliably continue, even through storms. It would save lives. Besides that, people enjoying the canyon would no longer have to worry that nature might trap them up there.

Where to Establish the Gondola Station? (Not at the Mouth.) As the proposal for **Scenario 3B-1 persuasively demonstrates, La Caille Station is the clear answer**. Installation of a station at the mouth of Little Cottonwood Canyon would be forced, and create numerous problems. UDOT has undoubtedly identified many. From this writer's perspective, a station at the mouth would at least partially obstruct the awesome and unique view we all want to see as we enter the canyon. Worse, it would seriously complicate traffic. The resulting congestion would not only be confusing, frustrating and discouraging; it would be dangerous for the public. Besides human costs, accidents would bottle up traffic. Any solution to those problems would require huge, costly changes -- which may not succeed.

The entrance to this majestic canyon really ought to be graceful, like an entrance to a National Park. And, the gondola station should become an attraction in its own right. The opportunity to establish the **La Caille Gondola Station** retains (even enables enhancement of!) the grand entrance to the canyon. It completes the gondola plan and complements the plan's benefits. Traffic flow would be smoother at **La Caille Gondola Station**. And, UDOT would have the luxury of planning for the station (a) to be part of a new development, (b) to blend into the natural surroundings, and (b) to be an efficient and effective intersection of transportation. People could efficiently go to and from the **La Caille Gondola Station**, whether they are heading to the canyon or back into the valley. The **La Caille Gondola Station** would attract and encourage use of the gondolas, would be safe, and would help protect Little Cottonwood Canyon, including the canyon's grand entrance.

Little Cottonwood Cyn. Comments

My Big Picture Overview:

This is a Transportation Proposal working within the scope of a supposedly Managed Watershed. Management has been lax, to say the least between the USFS, SLPU, SL County, and Salt Lake City. The Forest Service has been hit the hardest, due to lack of funds and personnel and a huge visitor base. SL County never included the canyons in their Master Plan. Without the coordinated efforts of all these agencies, it is why we are here after 30 years of discussion and no action.

Hopeful conclusions:

What is hoped is that the outcome of this study is what would then be relevant to what might happen in Big Cottonwood Cyn. and perhaps Mill Creek Cyn. Tying together a fee or toll that would be applicable to all of the canyons on the Wasatch Front that would help fund maintenance, toilets, trails, police and fire concerns that are prevalent to all of the canyons. Alta and Brighton towns are too small to incur all of the costs of the emergency services for all visitors we now see. People who drive in the canyons should pay some amount to cover some of these expenses. One consideration that has not been explored would be to have a lesser bus (than what is proposed) service in the winter (for Little Cottonwood at this point) and maybe greater in the summer that would provide stopping points in the canyon at trail heads, climbing areas, ski access etc. This also could be free or slight cost, but would hopefully make more frequent stops. With less traffic on the roads due to fees on cars and with the Gondola in use, service to trailheads would be more expedient.

Good options for LCC:

The Gondola option is the best. It should be free. It would provide an alternative to car travel up the canyon, and with some fee on cars, would focus more people to the larger parking lots. Especially in the winter, having the gondola run from 7 AM till 9 PM would be a reasonable time frame. Back country skiers, hikers etc. with the expanded parking in White Pine, Gate Buttriss, Bridge, Lisa Falls, would be first come first served. Parking as has been stated in UDOT's overview, would not provide any further spots than what exists today (basically). Other people would have the option of using the bus as an alternative. Management of the fee is easiest when every car has to have one, for those who use provided parking. Summer Gondola could have hours 9 AM to 9 PM or based on usage to the Ski resort areas. Gondola access from the Gravel Pit and Parking at 9400 So. by bus should be accessible from both directions to spread out parking in those facilities. I have heard of the proposal from Alta to build a parking facility in the old Park and Ride (bottom of Little CC) and would not be opposed if it was free parking and available for first come first served patrons. (Or would the canyon fee apply?)

I am for the Five Lane Alternative on the Wasatch Blvd. improvement, as you could always change that to the Imbalanced Lane approach and the costs are similar.

Snow sheds are a waste of time and money with the Gondola approach and they are the real eyesore to the canyon setting.

I am not interested in having our transportation system linked to the Park City area. But I would appreciate some consideration to providing an egress means for Big and Little Cottonwood Cyns. I believe that this alternative route with the Gondola provides an alternative

for Little Cottonwood Cyn. in conjunction with the road, but there is no egress for Big Cottonwood Cyn. especially in the winter time. I hope there is further discussion on this.

Transit Hubs should be equal settings for bus access to the Gondola and bus service to the trailheads.

I am most concerned that this has been a scientific approach to how the canyons meet the objectives and requirements, within the study area, and operational aspects. But what is lacking is a vision of how the State of Utah wants to project its vision of tourism and maintain its highly coveted interest in providing high quality water to the residents of Salt Lake City, while at the same time providing a recreational opportunity in the existing watershed. This has been forgotten as in all the surveys that have been out in the past many years. The number one concern was that we maintain a high quality watershed for Salt Lake.

Thanks for your consideration,

A handwritten signature in black ink, appearing to read "Bart", written in a cursive style.

Bart Reuling

Adding more buses is not a bad idea, but I doubt it will work.

This works in theory, but I would say it will not achieve the overall goal of reducing traffic in the canyons. I live at the base and the biggest problem you are not looking at is that the canyons are NOT always crowded. They are mostly only crowded on holidays, weekends, or powder days!

Things to look at:

1. are the buses currently at max capacity?
2. what are the incentives to riding the bus vs driving a car. Or what would the incentives be?
3. other reasons canyon is crowded
 - 3a. (buses/cars sliding off the road
 - 3b. cars getting stuck.
 - 3c. road closures

On a powder day no one is rational, we are all trying to get up the mountain and some only have time for a run or two. Others are on vacation and have kids, they are not willing to give up mobility they are usually the ones who don't know you need 4wd or are not used to icy conditions and slow up/completely stop the road. And lastly, if the snow is falling too hard WE HAVE TO SHUT THE CANYON DOWN ALL TOGETHER!!!! We can have all the buses in the world, it won't matter if people don't use them or can't use them.

Reasons a gondola is a better idea.

1. it is fun, people will want to use it. it could be more scenic and if done properly will have minimal impact on the habitat.
2. it wouldn't be subjected to road closures. If done properly we would no longer have to worry about road closures up or down the mountain. We can get there earlier and stay later.
3. Will be more stable. if a family of 4 spends thousands of dollars to ride the best snow on earth and then can't because the conditions are "too good" to get up the mountain, they probably aren't coming back.
4. it would be it's own destination, people would come for it! no one is coming to Utah for the buses.

5. it could possibly pay for itself, and over time would be less impact on the environment. Using solar credits could even make it carbon negative.

I strongly suggest looking into a gondola system in more detail. It will create a steady flow in and out, will still allow people to drive. Will wind up being less of an impact on the environment. And will be a draw rather than a hassle. I have some ideas for how best to setup a station as well, but will go into more detail if the gondola proposal passes.

I love this canyon + am very
Proud to live here. I just want
whatever change to be worth while!
I just don't see people actually using
the bus.

But a gondola / parking garage / apres ski
center where the old Shopko is. Now that is
something of a draw!

**Subject: Salt Lake City Comments
Draft Alternatives Development and Screening Report, Little Cottonwood Canyon Environmental Impact Statement SR 210 – Wasatch Boulevard to Alta, June 8, 2020**

To Whomever this May Concern:

This letter transmits comments from the Salt Lake City Department of Public Utilities (Salt Lake City, or the City) in response to the Utah Department of Transportation's (UDOT) *Draft Alternatives Development and Screening Report, Little Cottonwood Canyon Environmental Impact Statement, S.R. 210 – Wasatch Boulevard to Alta* report dated June 8, 2020 (LCC EIS). Salt Lake City appreciates the opportunity to provide comments for this EIS. The Little Cottonwood Canyon watershed provides a significant portion of the City's water supply. The City has legal jurisdiction within Little Cottonwood Canyon related to its water rights, watershed management, water infrastructure, and provides specialized expertise within the LCC EIS study area.

SALT LAKE CITY'S COMMITMENT TO PUBLIC HEALTH AND CLEAN WATER

The canyons of the Central Wasatch Mountains provide an affordable, reliable, high-quality water source for over 360,000 people within the City's service area for its public water supply. The City's service area includes all of Salt Lake City, and portions of Mill Creek, Holladay, Cottonwood Heights, Midvale, Murray, and South Salt Lake. Population growth projections anticipate the need to supply water for another 150,000 residents within our service area the next 40 – 60 years.

That the supply of water from the Wasatch Mountains is affordable, reliable, and of high quality is no accident, but part of a larger legacy of fastidious stewardship dating back to the arrival of the pioneers in 1847. Salt Lake City's Mayor and Council blocked a major mining operation in the Wasatch in 1873, a development which the City feared would lead to unsustainable growth in the watershed and compromise the water quality required by the City and its residents to grow the population and cultivate a thriving economy. Nearly a century and a half later, pressures on the City's water supply remain, though the nature of them have changed. No longer is the greatest threat impacting water quality coming from the creation of the new mining operations. The modern pressures threatening water quality and quantity are profoundly different: development, increasing visitation in both the backcountry and front country, a growing population, and the impacts of climate change. Land use and transportation within these watersheds are profoundly interrelated with these pressures, and decisions stemming from the LCC EIS could further exacerbate threats to the City's drinking water supply.

The City has a legacy of steadfastly protecting the watershed benefits residents, businesses, and the broader economy depend upon within the Salt Lake Valley. The high quality of water rushing from the springs and snowmelt of the Central Wasatch Mountains requires minimal filtration and chemical treatment. This minimal treatment protects public health and results in lower costs to ratepayers. This means residents can be confident that the water from their tap meets all the federal Safe Drinking Water Act requirements, and that families can afford to grow and take root in the Salt Lake Valley and businesses can thrive.

The Salt Lake Valley’s success is inextricably linked to the quantity and quality of our water. Congress recognized this link as foundational to decisions in the Central Wasatch as far back as 1914 and 1934 when enacting federal legislation directing the United States Forest Service (USFS) to manage federal lands within the watershed in a manner consistent with the protecting the City’s culinary water supply. The current USFS Wasatch Cache Forest Plan continues this century-long effort. The plan prioritizes the primacy of water quality and watershed health in the management of the Central Wasatch Mountains by recognizing “the need to provide long term, high-quality culinary water to the large urban population of the Salt Lake Valley.” The City remains firmly committed to public health and protecting water quality and quantity and will, as we have since our inception, protect these interests for the benefit of the public.

SALT LAKE CITY IS LEGALLY BOUND TO REGULATE THE WATERS QUALITY

As noted in previous LCC EIS comments to UDOT, the City remains committed to its critical duty of providing clean, safe, affordable, and high-quality water for the residents of the Salt Lake Valley. The City is also legally bound by state and federal regulations that oblige us to provide clean, safe water and to protect the public health and community prosperity.

The City must comply with requirements promulgated through federal and state water quality statutes, including the Safe Drinking Water and Clean Water Acts. As a Public Water System, the City must meet strict regulatory obligations requiring the protection of drinking water sources as critical to safeguarding public health.¹ The City is subject to the state Safe Drinking Water Act requirements and Administrative Rules regulating Public Water Systems. These regulations require the City to protect surface water sources of drinking water, to conduct source water assessments, and engage management strategies protecting the deterioration of water sources.²³

State statute grants the City direct jurisdictional authority for the protection of the Central Wasatch watershed. Section 10-8-15 of the Utah Code gives the City extraterritorial jurisdiction for the construction, operation, and maintenance of waterworks, and to protect from pollution the water that is “used in and necessary for city waterworks.” The City’s authority to protect against water pollution extends throughout the “entire watershed.”⁴ Further, state law authorizes the City to “enact ordinances preventing pollution or contamination of the streams or watercourses in which the inhabitants of the cities derive their water supply.”⁵ The City has enacted watershed ordinances to further protect against the deterioration of the quality of water emanating from the Wasatch Mountains.⁶ The City also has joint authority with Salt Lake County Health Department Regulation #14, the purpose of which is to:

“regulate the use and occupancy of watersheds within Salt Lake County in a manner that will protect and promote the public health, safety, and welfare; prevent damage to property; prevent the spread of disease; prevent the creation of nuisances; prevent air and water pollution; and promote conditions that contribute to the preservation and protection of drinking water quality.”⁷

Additional local guidance, rules and regulations working in coordination to protect the City's water supply are: Salt Lake City Watershed Management Plan; Salt Lake County Canyons Master Plan; Salt Lake County Foothills Canyon Overlay Zone; Salt Lake County Mountain Resort Zone.

The above federal, state, and local efforts are mentioned not only as a recitation of Salt Lake City's legal duty to protect the watershed, but as a way of illustrating to UDOT over a century's worth of legal and policy filters put in place to keep the City's water clean and affordable. As such, the City was named as a Cooperating Agency for the Project. On December 13, 2019, the City submitted comments to the EIS Draft Purpose and Need and Draft Alternatives and Screening Methodology. The City's primary focus was that the Alternatives and Screening Methodology should elevate consideration of the Safe Drinking Water Act and other water related matters to a Level 1 screening criteria. By doing this, UDOT would have been placing the protection of clean water equal to other key considerations for the LCC EIS. UDOT declined to accept the City's comments and responded that it could interfere with some transportation alternatives that might be considered. The City believes that this is a fundamental flaw in UDOT's process in developing the EIS.

COMMENTS TO THE LCC EIS

1. Purpose and Need

UDOT's stated purpose for the project is to "improve transportation related safety, reliability, and mobility on S.R. 210 from Fort Union Boulevard through the town of Alta for all users on S.R. 210." Since the project's inception in 2018, the City has repeatedly stated that UDOT's adoption of a Purpose and Need statement, which neglects Little Cottonwood's primary role in providing drinking water to the Salt Valley, is insufficient. UDOT's waiting to apply watershed and water quality standards, such as the Safe Drinking Water Act, for which the City is legally obligated, until the secondary screening, risks selecting an efficient transportation model but a substandard model for water quality. Even in circumstances where UDOT identifies a model that meets Level 2 screening requirements, UDOT will still only have selected the best transportation option with acceptable water quality measures. Whereas, had UDOT incorporated watershed and water quality as Level 1 screening requirements from the beginning of this process, the outcome would be both the best solution for our watershed as well as the best option for transportation.

The City remains concerned that this project does not fully incorporate a solution to all the transportation challenges in the Cottonwood Canyons. It seems as if there may have been a missed opportunity to incorporate Big Cottonwood Canyon and popular summer season travel in this analysis given the explosive growth of recreational demand year-round. The current pandemic has dramatically highlighted the need for comprehensive year - round transportation and recreation planning in Big and Little Cottonwood Canyons.

2. Impacts to the City's Beneficial Use

UDOT should consider whether alternatives could directly or indirectly impact City water infrastructure, particularly the treatment plants and intakes along Little Cottonwood Creek. Further, UDOT should include the City's land and water rights to ensure that the actions proposed in the EIS do not impact the City's ability to use its water rights. The failure to protect these assets puts at jeopardy the reliable delivery of clean water to 360,000 people and very broad economic investments when compared to the LCC EIS, which appears to be limited to commercial ski resort and skier interests during the winter.

3. Consideration of Climate Change

UDOT's climate change analysis neglects the many threats posed to the Wasatch Canyons watersheds, including Little Cottonwood Canyon. Recent scientific studies of climate change in the Wasatch Mountains paints a dire picture. Forecasts include climate change impacting snowpack, water quantity, quality, stream temperature, timing of spring

runoff, fluctuations in high flow events, and the loss of high elevation riparian and wetland habitats further impacting water quantity.⁸⁹¹⁰

Climate change studies expect water quantity to “decrease significantly by the 2040s and considerably more by the 2080s.”¹¹ These studies project future snowmelt and spring runoff to occur 1 to 3 weeks earlier. At the same time, winter high flow events, with rising turbidity, are expected to increase as winter temperatures result in more rain and less snow at higher elevations.¹² Decreasing water quantity means that small impacts on water quality, such as pollution and turbidity events that would have been minor in times of higher flow, resulting in times of scarcity, in an outsized impact on overall water quality.

Further compromising water quantity, scientists expect warming temperatures and reduced snowpack to result in fewer high elevation riparian and wetland habitats. In turn, this will result in drier and less productive systems as the ecosystems in more elevated sections of the watershed have little room to escape warming temperatures by moving upslope.¹³ Climate change analysis of the Wasatch tells us that dwindling water quantity will affect “the abundance and diversity of biota in riparian zones,” which play an essential role in water quality.¹⁴ Dwindling water supply will alter sediment supply and channel shape again, impacting water quality.¹⁵ Scientists expect climate change to result in recreation impacts, which will increase pressure on water quality.

Climate scientists have identified the Central Wasatch as highly vulnerable to “recreation activity that degrades riparian areas, contributes pollution, increases erosion, and can lower water availability ... compounded by longer summer seasons that lengthen the amount of recreational activity that may shift into higher elevations.”¹⁶ Climate change also poses risks to the springs and seeps, as warming temperatures “increase evapotranspiration and consequently decrease streamflow,” thus leading to a higher likelihood of intermittent flows of perennial streams feeding into the waters of Little Cottonwood Creek.¹⁷ Climate projections anticipate that less snowpack may lead to ephemeral streams having “shorter periods of streamflow with flashier patterns of inundation and drying.”¹⁸

The Wasatch watershed can expect a drier future, with reduced streamflow, less productive wetlands, and riparian areas, intermittency of once-reliable perennial streams, and flashier storm events leading to higher turbidity. The most recent analysis of climate change impacts to the Wasatch watershed confirms what we already know: reductions in water quantity result in consequences to water quality, and that “reductions in water quality will lead to increased treatment costs for municipal users, as well as potential losses in biological function.”¹⁹

¹⁹ J. Halofsky, pg. 386

For the reasons named above, the City requests that UDOT respond to the primary importance of water and its impacts on the residents of the Salt Lake Valley by elevating water resources and adherence to federal, state, and local rules and regulations to a primary, and not a secondary, purpose.

4. Road Widening

UDOT alternatives that include the widening of S.R. 210 need to consider potential impacts on water quality resulting from increasing the number of impervious surfaces located in the canyon. Additionally, road widening will result in decreasing the buffer between the road and the creek. In areas of high slope degree, wide buffers are necessary to trap sediment and pollutants, maintain stream temperature, protect streambanks from erosion, moderate stormwater flows, and provide wildlife habitat, all services which are essential to protecting water quality.^{20 21 22}

However, with any proposed modification to the roadway, the City is encouraged with UDOT's ability to consider the right sizing of existing culverts, the addition of guardrails or barriers in key locations to keep crashes out of the creek and the opportunity to update all the stormwater best management tools and facilities in the canyons. As UDOT has pointed out, many of these culverts and drainage issues need repair and updating. The City appreciates UDOT's awareness of the existing issues with stormwater on Highway 210 and the need to incorporate modernization of storm water management both in this LCC EIS process and in their daily operations by their team that works so hard to keep the highway safe and functional.

5. Trailhead Parking

UDOT addresses trailhead parking impact on stormwater and Little Cottonwood Creek water quality. In addition to addressing stormwater, UDOT needs to include stormwater Best Management Practices (BMPs) and associated operation and maintenance in perpetuity. The City is concerned that increased parking and the hardening of parking areas will result in more impervious surfaces, which will impact runoff and water quality. “[R]unoff from impervious areas such as parking lots, local roads, and highways can increase storm flows and increase concentrations of sediment, nutrients, deicers, trace elements, and organic constituents in receiving water bodies.”²³

Further, worth mentioning is the existing Forest Plan's prohibition on additional parking. The USFS Revised Plan states that the:

Protection of watershed conditions will be a primary factor in managing roads, trails, and access. In the Tri-canyon area (Big and Little Cottonwood Canyons and Mill Creek), parking capacities of canyon parking lots (ski areas, summer use homes, developed and dispersed recreation sites) will not exceed 2000 levels unless modification is needed for watershed protection or to facilitate mass transit.²⁴

²⁴ USFS Revised Plan,. 4-160

While the LCC EIS accounts for the USFS moratorium on increased parking numbers and states that new and improved parking areas will not surpass this limit, it is worth reiterating that there does exist a moratorium on parking. UDOT relies on removing roadside parking to avoid exceeding the USFS limit. The City would like more specificity in how this will be enforced, and by whom. Will UDOT take additional infrastructure steps to enforce the ban on roadside parking, and what are the anticipated expenses of administering this ban?

Further, increasing parking in areas such as Lisa Falls (increasing parking from the existing 17 to 65) will result in increased visitation pressures on these areas. This increase in visitation may result in the need for additional amenities and possibly water quality degradation at the sites of parking improvements. To guard against this scenario, UDOT should ensure that any restroom designs comply with Salt Lake County Health Department Ordinances, including setback requirements. Areas with additional trailhead parking should minimize the removal of vegetative buffers and incorporate stormwater solutions to reduce or eliminate any, and all stormwater discharged into Little Cottonwood Creek. Additional trailhead parking promotes the use of personal vehicles and detracts from incentives for mass transit, which ultimately strikes against the stated purpose and need of the EIS.

The City also requests that UDOT incorporate an operation and maintenance funding component in its impact analysis of the additional restrooms and trailhead parking this project ponders. The City supports collaborative efforts to maintain recreation sites in the interest of protecting water quality. Presently, the City is in a partnership with the Central Wasatch Commission, the Salt Lake Ranger District of the Uinta-Wasatch-Cache National Forest, Snowbird and others to clean restrooms. It is the City's understanding that the baseline funding levels from the US Forest Service do not accommodate day to day cleanings, operations and maintenance of trailhead facilities, let along long-term capital costs. If this project adds additional recreational facilities on the Salt Lake Ranger District, the City requests consideration of cost analysis and associated funding sources to adequately steward these areas. Note that this request does not include the costs associated with the heavily used stream corridor that both the proposed Bridge Trailhead and Lisa Trailhead areas service. These areas are plagued by graffiti issues, multiple non-sanctioned trails that contribute greatly to streamside erosion and sedimentation, etc.

6. Clean Water Act

The City supports including the protection of wetlands and the CWA Section 404(b)(1) in the Screening Criteria. However, in the context of these watersheds and the importance of water resources, this is too narrow. As such, the City requests expanding the CWA analysis to include other sections of the CWA, including Section 303. Additionally, the City asks the Level 2 Screening Criteria include impacts related to the Utah Water Quality Act. The Screening Criteria needs to contain compliance with UAC R317-2 Standards of Water Quality of the State. This includes, but is not limited to, protection of Category 1 Waters. The Screening Criteria should state the alternatives will be protective of the beneficial uses assigned to the Little Cottonwood Creek, as outlined in UAC R317. This consists of the beneficial use designation of Class 1C: Protected for domestic purposes with prior treatment by treatment processes as required by the Utah Division of Drinking Water (DDW); Class 2B: Protected for infrequent primary contact recreation; and Class 3A: Protected for cold-water species of game fish and other cold-water aquatic life, including the necessary aquatic organisms in their food chain.

7. Built Infrastructure

In addition to the natural infrastructure of the watershed, it is important to protect the existing built infrastructure. The sewer collection system serves essential public health and water quality purpose. It is essential to protect this infrastructure and ensure any alternative does not inadvertently impact or expose the sewer collection system.

Furthermore, a change in water quality and flow regime could impact the drinking water infrastructure and the ability to treat water. A negative impact on water quality could reduce or even prohibit the Metro Water Treatment Plant (Metro WTP) from treating water to deliver to the public. For example, the Metro WTP would need to stop treating and delivering water should there be a significant increase in turbidity. Also, should there be an increase in pollutants and pathogens, there is a possibility the Metro WTP would need to alter or even wholly upgrade to an enhanced treatment process to accommodate the increase in pollution. This change in the treatment process would be very

costly, both in capital costs and ongoing operation and maintenance costs. Furthermore, the ratepayers would bear these costs to accommodate the increased access to winter resort recreation. Therefore, there is a social equity element that needs to be strongly considered for all alternatives.

8. Snow Sheds

According to the LCC EIS, likely alternatives require two snow sheds totaling 3,194 feet, the realignment of the road to place snow sheds closer to the mountain, as well as lessening curves in the existing road. Constructing snow sheds and further canalizing S.R. 210 will require significant development, which is a risk to water quality and quantity. The EIS fails to provide any analysis of the impact the snow sheds may have on Little Cottonwood Creek by accelerating avalanche debris over the road and depositing it directly into the creek area. Would this result in more significant debris in the creek? Would this result in more creek flashes and increase turbidity? Would this contribute to localized flooding and streambank erosion?

Furthermore, the City requests that UDOT incorporate into its analysis the impact of the deposited avalanche debris and compacted snow on both streamside health, including wetlands and riparian vegetation. UDOT may need to consider further acreages of impacted wetlands in this consideration. Compacted snow and avalanche debris may linger far longer than natural snowpack and reduce the health of the riparian corridor.

As per past conversations with UDOT, the City requests that, if the snow sheds were to be selected as an option moving forward, that the fire suppression system required in these structures have full secondary containment to avoid severe contamination of the creek post-accident. Additionally, the City would like to review any roadway runoff management designs for the snow sheds if they are selected.

9. Gondola

The gondola alternative results in the City's following concerns:

- Impacts on water quality, riparian areas, and stream buffers of the development footprint and associated access roads for the twenty pads necessary to host gondola towers.
- The gondola alternative requires an angle station which necessitates an independent power source. The City is concerned about the potential impact of the independent power source and associated fuel should a rupture occur impacting the surrounding area and Little Cottonwood Creek. Further, the City is concerned that should such an event occur, there should be a warning system installed to notify the water treatment plant operators of the immediate need to divert incoming water from the creek.
- Any supplementary power system that is used as a backup power system should have full secondary containment for fuel and other related liquid spills that could contaminate the water flowing down to the plant intake. This includes diesel generators and other associated fluids.
- This alternative requires a high user fee on personal vehicles necessary to incentivize gondola use. The high user fee will negatively impact the ability of low-income households to access public lands.²⁵
- The gondola alternative, at great expense and with little improvement in travel time, appears to do very little to alleviate canyon traffic congestion. Further, this option does not address traffic conditions for dispersed canyon recreation or travel beyond the winter ski season. The City remains concerned that the LCC EIS does not address the Cottonwood Canyons transportation issues in a holistic fashion, both the travel time analysis for gondola and

²⁵ Section 3.1.2.2.4 states that the success of the gondola alternative is dependent upon a higher use fee for vehicles.

the narrow focus on winter seasonality put the project's success at risk. Failure to incorporate the use of the parking nodes and mobility centers by backcountry skiers and the high volume of Big Cottonwood skiers does not accurately consider time gains from the gondola.

- The gondola alternative leaves unanswered questions of ongoing operations and management of infrastructure
- Noise and privacy impacts on residents, visitors, and those using USFS campsite areas
- The City desires more information on the details of both the travel corridor in its relation to the initial project area and the project's purpose and need statement. The gondola's travel corridor seemingly departs the EIS' initial defined project area. The possibility of a gondola in a riparian area, over the creek and the need, like ski lifts and power lines, of both herbicide and vegetation clearing crews introduces a vulnerability to the water supply that presently does not exist. As per Salt Lake County Health Department Regulation #14 and Salt Lake City Watershed Protection Ordinance 17.04, use of herbicides is not legal within 100 feet of the creek. Additionally, the City has concerns about the introduction of invasive species in these corridors with the increased and new disturbance area of a gondola.
- The withdrawal of a new travel corridor, one that is outside the existing highway 210 corridor may also induce the removal of riparian and stream side lands from the management of the Uinta-Wasatch-Cache National Forest. Based on its current understanding of the issue, one that has been formulated through discussions with UDOT's LCC EIS team and representatives from the UWNCF, the City does not support this appropriation of lands given that this will remove these lands from the oversight of the UWCNF forest plan. The plan provides that these riparian corridors and stream side lands remain primarily managed for protection of drinking water supply and not as a travel corridor. These lands were primarily and initially set aside for provision of drinking water and appropriation of lands outside the existing SR 210 corridor and project area undermines over a century of watershed protection.

10. Cost and Benefit

The City requests that UDOT incorporate a cost analysis of the return on investment in the local economy each option provides correlated to both travel time and the closures of the highway. The City is presently updating all infrastructure, including water treatment plants, wastewater recovery facilities, storm water lines, water lines, pump stations, etc. As an entity beholden to fiscal responsibility to ratepayers, all decisions are analyzed with an eye towards stewarding public fiscal resources, especially considering the ongoing pandemic. It would be helpful for commenting purposes to better understand the return on investment each option that UDOT has presented in cost. While cost is not in the screening criteria or listed within the purpose and need, it seems like a cost analysis would strengthen the EIS's chances for successful analysis to move forward on eliminating the traffic burden and achieving project success.

The City appreciates the collaboration, meetings, and discussions with UDOT throughout the LCC EIS process. Please do not hesitate to contact us regarding our formal comments to the LCC EIS.

Sincerely,

To: UDOT LCC EIS Consultant Team
From: League of Women Voters of Salt Lake City
Re: LCC EIS Comments on Draft Alternatives

Dear UDOT Personnel and Consultant Team,

The League of Women Voters of Salt Lake City (LWVSL) is concerned about the range of alternatives proposed for consideration and the limited scope for each. Additionally, the alternatives appear to limit or completely ignore less impactful actions with important good outcomes over expensive, environmentally and visually damaging consequences to the canyon and our enjoyment of them.

We believe that more incentives coupled with higher tolls on single-occupancy vehicles, a more efficient bus system with preference for bus transit users, and enforcement strategies that ticket illegal on-road parking could have almost immediate and effective positive impact. We question the need/value for a gondola, and have concerns about the environmental consequences of either of the snowshed solutions proposed.

The gondola will have damaging consequences for visual quality and ridge line protection, both of which are positions on which the League has reached consensus through much study and discussion. The snowsheds will require disruption to large areas of the canyon side-slopes which will remove vegetation, increase erosion, decrease snow melt absorption into the soils, increase flood potential, and damage critical water quality - another consensus-built position that the LWVSL has studied.

Our primary concern with the canyons is their environmental integrity, most especially the watershed we all rely on. As the climate changes with anticipated less snow pack and warmer temperatures, our reliance on that incredibly valuable resource - the Wasatch Mountains and the seven creeks that flow through its canyons - becomes even more vital to our survival and quality of life.

As you know, the League is a non-partisan organization which relies on study, discussion, and consensus before our carefully considered positions are announced. We urge UDOT to reconsider and re-evaluate these proposed alternatives and seek alternatives with a lighter touch and a considered, more sustainable and less costly approach.

Respectfully,

littlecottonwoodeis@utah.gov

**Subject: Comments for the Little Cottonwood Canyon EIS Draft Alternatives
Development and Screening Report**

To Whom It May Concern,

This letter transmits comments from Metropolitan Water District of Salt Lake & Sandy (MWDSLS) in response to the *Draft Alternatives Development and Screening Report, Little Cottonwood Canyon Environmental Impact Statement, S.R. 210 – Wasatch Boulevard to Alta* (LCC EIS). This letter also expresses MWDSLS's support for Salt Lake City Department of Public Utilities' comments on the LCC EIS. The SLC comments are largely applicable to MWDSLS and are therefore adopted herein by reference.

MWDSLS owns and operates the Little Cottonwood Water Treatment Plant. MWDSLS diverts and treats Little Cottonwood Creek surface water and delivers it on a wholesale basis to its two member cities, Salt Lake City and Sandy City, as well as to the Jordan Valley Water Conservancy District. This water is then delivered within the respective service areas of these entities, with the potential to be used by over one million people in the Salt Lake Valley. The importance of source water protection of Little Cottonwood Creek for the public health, safety, and welfare of nearly the entire Salt Lake Valley cannot be overstated.

Due to the importance of Little Cottonwood Creek as a primary drinking water source, the impacts of the proposed alternatives on Little Cottonwood Creek and its surrounding areas need to be fully considered. MWDSLS appreciates that the proposed alternatives may have beneficial impacts to water quality with the improvements to trailheads, limitations to roadside parking, and improvements related to traffic safety. But, at the same time, there are many potential risks associated with source water quality degradation that could result from the proposed alternatives presented in the LCC EIS. The most important risk to consider is risk to public health. Increased recreational use of Little Cottonwood Canyon can result in short and long-term contamination of source water if restroom facilities and waste are not properly improved, managed, and maintained. Additionally, increased traffic and/or fuel storage in the watershed that may result if the proposed alternatives are implemented increase the risk of spills or migration into the Creek. This has the potential to greatly impact public health, especially if MWDSLS is not promptly notified.

Another risk that needs to be considered in the process of selecting alternatives is reduced reliability of the source water. MWDSLS is concerned that the alternatives may result in more

Metropolitan Water District of Salt Lake & Sandy

3430 East Danish Road, Cottonwood Heights, UT 84093

Phone: 801-942-1391 Fax: 801-942-3674

www.mwdsls.org

frequent loss of the source due to increased sediment and debris in the Creek, or spills and contamination that result in the need to turn out or bypass the Creek water to protect public health. Specifically, MWDSLS is concerned that installing snow sheds or that removing vegetation for a gondola corridor will cause more debris and sediment to enter the Creek. Debris and sediment adversely impact the surface water intakes and conveyance systems that bring Creek water to the Little Cottonwood Water Treatment Plant. This can require that the Creek water be bypassed while sediment and debris is cleared. This results in Salt Lake City and Sandy City losing a vital piece of their drinking water supply portfolios.

Finally, there is a risk that the alternatives proposed can result in increased operation, maintenance, and capital treatment costs as a result of degradation of water quality. MWDSLS is required to meet Safe Drinking Water Standards regardless of the quality of the source water. If water quality is adversely impacted from implementing one of the proposed alternatives, then MWDSLS may experience increased costs due to increased filtration requirements, increased use of chemicals, increased maintenance activities, or increased costs for implementing capital projects to continue to meet water quality standards. These increased costs are ultimately passed on to the end user (residential, business, non-profit, government, etc.).

MWDSLS urges you to consider the comments presented here, as well as the comments Salt Lake City Department of Public Utilities has submitted in moving forward with the LCC EIS process. MWDSLS appreciates the opportunity to provide comment. Please do not hesitate to contact me if you have any questions or would like to discuss further.

Sincerely,

Michael J. DeVries

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121

To Whom It May Concern:

I would like to express my favor for the gondola option based at the La Caille station as the solution for Little Cottonwood transportation for the following reasons:

The gondola option provides the most economical, safe and reliable transportation for Little Cottonwood Canyon while also having the benefit of minimal environmental impact. The gondola option will also showcase a gem of the Salt Lake valley while limiting the impact on the watershed, reducing automobile traffic and emissions, and protecting the surrounding neighborhoods and communities from congestion and overuse.

A gondola will make the canyon accessible to locals and tourists while maintaining the pristine beauty of the canyon. Because it will be an attraction for all, a huge benefit for patrons and employees of the resorts, and accessible no matter the condition for skiers, the gondola option will conceivably pay for itself over time – particularly considering the decreased impact the canyon could otherwise suffer with the status quo or other vehicle options.

As a regular visitor of Little Cottonwood Canyon, an active snowboarder and hiker, and a resident just down the road from the canyon, I am extremely excited at the prospect of the La Caille gondola station option. I am anxious to help encourage state resources to a project that will bring such value to the valley while solving difficult transportation issues.

Thank you for your consideration.

Sincerely,

Kirk Cullimore

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121

To Whom It May Concern:

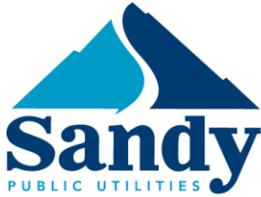

I would like to express my favor for the gondola option based at the La Caille station as the solution for Little Cottonwood transportation for the following reasons:

1. It's the most environmentally friendly option as compared to the carbon-based alternatives;
2. it reduces the number of vehicles travelling up and down the canyon and can remove ALL the busses in LCC; and
3. the cost of the Gondola system is by far the most cost effective and has the longest life cycle of any of the proposed alternatives.

Thank you for your consideration.

Sincerely,

Dan Hemmert

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121
littlecottonwoodeis@utah.gov

Dear UDOT Little Cottonwood EIS Project Team,

Sandy Public Utilities respectfully submits the following comments in support, and in addition, to Sandy City's earlier comment letter provided December 6, 2019. The original comments primarily addressed transportation related concerns of Sandy City. This correspondence provides additional comments regarding the City's drinking water supply source protection interests, as well as related concerns we anticipate and appreciate being addressed with the proposed project.

Sandy City relies heavily upon its high quality and reliable water supply from Little Cottonwood Canyon [LCC]. Sandy has significant water rights in Little Cottonwood Creek and has invested over \$150M in the water supply assets and infrastructure in this area. As a City of the first class, Sandy retains source protection authority over its drinking water supply. We are grateful for the ongoing partnership with UDOT, including this project, to assure continued protection of the quality of water supply in Little Cottonwood by addressing the risks of roadway and other pollutants to our water supply. Each of the proposed options have potential to be designed and constructed in a way that appropriately addresses and improves water quality protections. Likewise, each option could be implemented in a way that causes unacceptable and potentially irreversible negative impacts on public health and reliable water supply. Since the water in Little Cottonwood Creek takes as little as a few minutes to reach the drinking water treatment plant intake, and its contamination could cause severe and costly impacts to public health and the sustainability of our water supply, we appreciate the extra consideration for source water protection in LCC.

Please assure the alternatives analysis and each of the proposed transportation alternatives address important water quality issues for the Canyon, notably including:

- **The risk and impacts of vehicle accidents in the canyon.** Accidents can discharge fluids, including gas, oils and any harmful materials being transported.
- **The risk and impacts of increased recreation in the canyon.** More people require improved management of persons and their waste (trash, bathrooms, soil erosion, etc.), as well as the minimization of concentrated and untreated runoff from contamination areas (roadway drainage, sediment loads, parking structures, restroom facilities, etc.).
- **The importance on ongoing monitoring and treatment of water.** These plans will require provisions to ensure that the water quality from UDOT roadway and related facilities (storm drain inlets, parking lots, structures, construction sites, etc.) are monitored and treated prior to discharge to perennial and ephemeral tributaries with appropriate storm water and drinking water source protection best management

practices (BMP). Best practice improvements may include erosion control, oil/water separators, as well as dispersed treatment (infiltration at roadway shoulders prior to flow concentration, etc.) away from and prior to entering the stream.

- **The necessity to minimize and contain the risks of fire.** Ignition sources, fuels, and suppression during construction and long-term maintenance of transportation and recreation facilities in the canyon can create increased fire hazards.
- **The importance of water-specific operation and maintenance plans.** These will be needed to monitor and keep facilities clean and prevent contaminated discharges, as well as to monitor potential impacts.
- **The risk and impact of continued use of road salts and other chemicals on roadways.** The use of these chemicals will need to remain a highly managed and monitored practice to prevent impacts to the water supply, as well as canyon vegetation (a natural erosion and water treatment resource). Many other similar watersheds have had to eliminate and prohibit use of chemicals (salts, etc.) for snow removal due to impacts upon the watershed vegetation and water quality under Clean Water Act, Safe Drinking Water Act, and local drinking water source protection requirements.
- **The importance of developing solutions that minimize the potential risk and impacts of dispersed and concentrated water pollution for the long term.** These solutions should be a priority. Notably, addressing the issues identified above should fit into the alternative selection, and more important the physical and operational improvements to be contemplated. Objectives should include minimization of car accidents [and their impact when they do occur], monitoring and treatment of roadway pollutants, improved management of persons and their waste in the canyon, etc.
- **The overall short and long-term health of the watershed.** The solutions and alternatives evaluated, and the final selection, should consider the long-range implications to watershed health in tandem with recreation and transportation management.

Include Short and Long Term Regional Transportation Plan for LCC traffic thru Sandy. We wish to support previous comments from Sandy, Metropolitan Water District of Salt Lake & Sandy, the Central Wasatch Commission and other stakeholders. This includes the important requirement and need to include short term and long term regional transportation planning to address traffic of huge number of visitors to the canyon who originate from the South, with extreme congestion as they travel through Sandy City from 9400 South and Highland, and Wasatch Boulevard. The project should address existing and future problems on these roads, if even in future phases. Otherwise, it will limit the effectiveness of the options chosen, with potential if not likelihood to exacerbate existing problems on the access roads through Sandy to Little Cottonwood Canyon.

Thank you again for your attention to these issues to assure the continued delivery and availability of high quality and sustainable water for Sandy, its water quality partners, and the more than 500,000 persons who can drink the water from Little Cottonwood Canyon.

Sincerely,

Thomas Ward

TO: LITTLE COTTONWOOD CANYON EIS TEAM

FROM: NEWEL JENSEN

SUBJECT: COMMENTS TO LCC EIS ALTERNATIVES SCREENING REPORT

CC: JOSH VANJURA

After a cursory review of the Draft Alternatives Development and Screening Report for the Little Cottonwood Canyon Environmental Impact Statement S.R. 210 – Wasatch Boulevard to Alta, I encountered several issues with some of the assumptions and findings with this report, primarily at the Level 2 screening stage. I have noted these items in the paragraphs below.

Travel times

Enhanced Bus Service – no widening

- The travel time calculations appear to assume free-flow conditions on dry pavement. Experience has shown that on the highest demand days on Little Cottonwood Canyon, the travel times are significantly increased through either slippery road conditions, private automobile congestion, or both. Since the travel times don't appear to account for this, the comparison to other alternatives, including Enhanced Bus Service in Peak-period Shoulder Lanes (which could bypass slow moving traffic), Gondola Alternative (which would operate independently of automobile traffic), and the Cog-Rail alternative (which would operate independently of automobile traffic) are not accurate and may result in different alternatives chosen to be carried forward.

Enhanced Bus Service in Peak-period Shoulder Lanes

- The travel time calculations appear to assume free-flow conditions on dry pavement. Experience has shown that on the highest demand days on Little Cottonwood Canyon, the travel times are significantly reduced through either slippery road conditions, private automobile congestion, or both. Travel times don't appear to account for decreased speeds due to slippery road conditions. Since the travel times don't appear to account for this, the comparison to other alternatives, including the Gondola Alternative (which would operate independently of weather except during high wind events), and the Cog-Rail alternative (which would operate independently of weather) are not accurate and may result in different alternatives chosen to be carried forward.

Rail alternative

- The travel time comparison between the rail alternative, Enhanced Bus alternatives, and Gondola alternative do not originate in the same location. The travel distance for the rail alternative (Concept 4B) originates at the Historic Sandy Station, which is roughly 6.3 miles west of the mouth of Little Cottonwood Canyon, whereas the alternatives carried forward all originate at the “Gravel Pit Mobility Hub” which is 4.2 miles from the mouth of Little Cottonwood Canyon. This results in an 11 minute time disadvantage when comparing the alternatives. Additionally, this comparison does not account for time required to travel from the trip origin to connect to the alternative, whether it be the rail alternative or alternatives carried forward. Without an equal comparison in travel times, the conclusions drawn to carry forward the selected alternatives may not be well founded.

Capacity

Enhanced Bus Service – no widening

- The travel time, headways, number of rolling stock, and capacity calculations appear to assume free-flow conditions on dry pavement. Experience has shown that on the highest demand days on Little Cottonwood Canyon, the travel times are significantly increased through either slippery road conditions, private automobile congestion, or both. As travel time increases, either capacity decreases or the number of rolling stock required to accommodate a given capacity must increase. Since the travel times don’t appear to account for this, the comparison to other alternatives, including Enhanced Bus Service in Peak-period Shoulder Lanes (which could bypass slow moving traffic), Gondola Alternative (which would operate independently of automobile traffic), and the Cog-Rail alternative (which would operate independently of automobile traffic) are not accurate and may result in different alternatives chosen to be carried forward.

Enhanced Bus Service in Peak-period Shoulder Lanes

- The travel time, headways, number of rolling stock, and capacity calculations appear to assume free-flow conditions on dry pavement. Experience has shown that on the highest demand days on Little Cottonwood Canyon, the travel times are significantly increased through slippery road conditions. Travel times don’t appear to account for decreased speeds due to slippery road conditions. Since the travel times don’t appear to account for this, the comparison to other alternatives, including the Gondola Alternative (which would operate independently of weather except during high wind events), and the Cog-Rail alternative (which would operate independently of weather) are not accurate and may result in different alternatives chosen to be carried forward.

Rail alternative

- The capacity shown in Appendix F assumes a 15 minute headway of 4 vehicles per hour with 253 passengers per vehicle resulting in a capacity of 1012 people per hour. Rail can accommodate significantly higher capacities by joining multiple vehicles in a single consist. Any consist with a length less than 400’ would be compatible with existing stations in the UTA network. Doing so could easily accommodate in excess of 1600 people per hour (4 train consist at 15 minute headways). The comparison as currently described in this report which shows similar hourly

capacities between the Rail alternatives and Bus alternatives is not accurate and should not be used in the determination of alternatives to carry forward.

Avalanche Mitigation

Gondola Alternative

- Table S-1 in the Executive Summary states that the gondola could be used when S.R. 210 is closed for avalanche mitigation. The practice of firing artillery over an active, inhabited gondola line would not be safe, and it is unlikely that the US Army would permit such a practice.
- Additionally, the current practice of using military artillery for avalanche mitigation may be problematic with gondolas. It would be unsafe to continue gondola operation during an avalanche control mission since every target on the north side of the highway would require firing over the gondola line. Additionally, the proposed gondola alignment would pass through numerous zones within the 1000m clear radius of avalanche artillery (105mm HE anti-personnel cartridges). There is risk of damage from shrapnel to the wire rope and gondolas within the 1000m clear radius. A robust inspection program following every firing of avalanche artillery would need to be implemented to verify no damage to the wire rope or gondolas and safely operate the system.

Enhanced Bus Service in Peak-period Shoulder Lanes

- The cost of snow-sheds for the Enhanced Bus Service in Peak-period Shoulder Lanes alternative appears to be the same as the snow shed cost for the Enhanced Bus Service alternative. This does not appear to be correct since the cross section needed to accommodate the Enhanced Bus Service in Peak-period Shoulder Lanes alternative is wider, thus the snow shed would have a significant increase in cost.

Rail Alternative

- The rail alternative includes a significant cost of snowsheds. Appendix F states that avalanche paths would require avalanche shed mitigation to protect the overhead catenary system (OCS). This assumption may not be valid if other propulsion technologies are used, such as a hybrid battery/OCS system which can operate short distances without the OCS, or with a DMU propulsion system that uses diesel propulsion. Other systems could significantly reduce the cost of the snowsheds assumed with this alternative. Additionally, the snowshed cost assumed is for a conceptually designed “3-travel lane” snowshed, which would be more costly than a snowshed wide enough to accommodate a two-track cog rail, or a one track cog rail.

Cost Estimates

General

- The rail alternative appears to include approximately a 20% unallocated contingency cost, whereas the gondola alternative includes only a 10% contingency and bus alternatives do not appear to include any contingency. This results in an un-even comparison and an even comparison may result in different alternatives carried forward.

- The rail alternative follows SR 209 and ties into the UTA system at the 9000 South station. A more direct route would be to continue on 9400 South and tie into the UTA system at about the 9400 South station. This would reduce the length by more than 1/3 mile and associated costs.
- A cursory, high-level review of the cost per mile of the rail alternative is considerably higher than the cost per mile of other rail projects within the UTA network. A more thorough review of the cost estimate is recommended.
- The report acknowledges O&M costs for each alternative, but the cost estimates used in comparison appear to be focused on initial capital costs, and don't address full life-cycle costs. However, since this investment is intended as a very long-term solution for the canyon (lasting to the planning horizon, and hopefully generations beyond) considering the full life cycle cost of each alternative including the replacement of rolling stock, state-of-good repair costs, etc. will result in a better-informed decision on which alternative to carry forward.

Relocations

Rail Alternative

- The Alternatives Screening Report states that the Rail Alternative has 48 Residential relocations. The typical cross section used is wider than required per UTS Design Criteria. The Double Track Embedded in Street Layout shows a mountable curb outside of the nominal 28' rail corridor width. UTA criteria shows the concrete curb inside of the 28' envelope. This extra width could result in additional relocations which, if properly accounted for, could result in different alternatives carried forward.
- The Alternatives Screening Report states that the Rail Alternative has 48 Residential relocations. The construction limits shown, especially east of Quail Hollow Drive, appear to indicate that no retaining walls were used, and cut or fill slopes extend into properties that would require relocations. Using retaining walls in these areas would significantly reduce the number of relocations required and could result in different options carried forward.

Section 4(F)

Rail Alternative

- The report asserts that 37 Section 4(f) properties are impacted by the rail alternative, however the plans shown in the Alternatives Screening Report, Appendix F do not indicate where those impacts occur, therefore it is not possible to accurately comment on this.
- The rail alignment in Little Cottonwood Canyon shown in the Alternatives Screening Report, Appendix F appears to use relatively large radius curves. Historically, the Little Cottonwood Canyon Road was originally a rail alignment and the majority of the curves in the existing road could be matched by a parallel rail alignment. Using an alignment immediately adjacent to the LCC road would significantly reduce the number of Section 4(F) and recreational impacts that are stated in the Report. The reduced number of impacts could result in different options carried forward.

Since there are numerous, significant issues that call into question the conclusions of this report, I believe that UDOT should reconsider the Level 2 screening results.

Thank you for your consideration.

Newel Jensen

On May 17, 2019, EPA provided comments on the Draft Screening Methodology Report that included a recommendation that the NEPA analysis be used to satisfy the requirements of the Clean Water Act Section 404(b)(1) Guidelines (Guidelines). At that time, we also encouraged UDOT to apply the standard of practicability as defined in CWA as the first step in Level 2 screening to evaluate alternatives pursuant to the Guidelines and assure the inclusion of the least environmentally damaging practicable alternative within the range of alternatives analyzed in the EIS.

EPA appreciates the explanation provided in Section 1.4.2 of the report regarding Clean Water Act requirements and the Guidelines. EPA also notes a clarifying footnote related to CWA requirements in the report in Table 1-2 that includes the following statement: "Each alternative will be evaluated individually regarding cost, existing technology and logistics before the other criteria in this table are considered." EPA thanks UDOT for providing this clarifying footnote regarding the timing of the application of the Guidelines and that UDOT is working to satisfy the Guidelines' requirements through the EIS process given the importance of the resources within the Wasatch Watershed.

Based upon our cooperating agency review of the June 2020 *Draft Alternatives Development and Screening Report (Report) for Little Cottonwood Canyon Environmental Impact Statement, S.R. 210-Wasatch Boulevard to Alta*, we have the following comments and recommendations:

- EPA understands that travel demand forecasting plays an essential role in transportation planning studies and analyses that directly inform the alternatives considered in the NEPA process. FHWA addressed the importance of making travel forecasting assumptions clear in Section 2.4.7 of its *Interim Guidance on Application of Travel and Land Use Forecasting in NEPA (March 2010)* by stating that "...an explicit definition of the no-build condition with regard to land use, network, and modeling assumptions..." be clearly documented and incorporated as part of the project's public record. A "no build" alternative can typically include improvements already committed to in regional transportation plans, such as those reflected in the 2019-2050 Regional Transportation Plan (RTP) developed by the Wasatch Front Regional Council. According to Appendix A, Table A-1, of this report the "No Action" alternative appears to include planned transportation improvements and prohibitions outlined in the RTP.

Throughout the Report, the term "No-Action" or "No-Action 2050" is used without clear explanation of the term(s). The Report reflects the important nexus between transportation forecasting/planning process and NEPA to the public and stakeholders, and as such, it is necessary that key concepts are clearly defined. EPA recommends that a clear and succinct definition of "No Action 2050" be provided in Section 1.3.3 of the Report (where the term is first utilized) that appropriately explains what actions do/do not constitute 'no action' as a baseline for the current screening process. Such clarification will clarify the screening process for alternatives flowing from transportation planning into the review of action alternatives for the EIS. At a minimum, a cross reference to Appendix A, Table A-1 would serve the reader should they want to identify specific elements included in the assumed "No Action" and "No Action 2050" alternative(s).

- The Report does not consistently identify results from the "No Action" or "No Action 2050" alternative with regard to Level 2 Screening. For example, only Tables 2-21 and 3-9 include a comparison of expected acreages of particular impacts related to "No Action," while other similar tables reflecting Level 2 Screening results for alternatives do not include no action. EPA

recommends that UDOT review and modify the draft Report for consistent level of treatment of “No Action” for each of the alternatives evaluated according to the Level 2 Screening criteria. We believe that this exercise would result in greater transparency and understanding of the alternatives evaluation process.

Wasatch Mountain Club LCC EIS Alternatives comment (07092020)

The Wasatch Mountain Club (WMC) is a local organization focused on outdoor recreational activities and preservation of our environment. The WMC has over a thousand members and is celebrating its centennial this year. We have been recreating in Little Cottonwood Canyon for 100 years.

We are pleased to participate in the Little Cottonwood Canyon Environmental Impact Statement process and to provide our comments to the Alternatives Development and Refinement Report. The WMC has a special interest in the canyons of the Wasatch and preserving their beauty for future generations.

We appreciate UDOT's recognition that the need for this study area are prompted by the "anticipated future increases in visitation to Little Cottonwood Canyon as a result of population growth in Utah". Unfortunately, the future is already here as our canyons are being loved to death and something needs to be done now to improve transportation and ensure access to areas we recreate in. The current focus of this EIS on winter use only is very shortsighted and year-round transportation needs must be addressed. The fact that UDOT is totally ignoring the visual impact of alternatives is unacceptable.

The Wasatch Mountain Club has participated in all phases of this EIS so far and look forward to helping UDOT complete the process and develop a solution acceptable to all.

At this point, our comments are focused on two primary issues and our preferred alternative.

- 1) Ensuring that any alternative accommodates dispersed recreation in all areas of Little Cottonwood Canyon
- 2) Ensuring that any alternative preserves the natural resources of LCC including the visual quality of the canyon's environment
- 3) Year-round buses

The WMC agrees with UDOT's intention of improving the "commuter, recreation, and tourism experience" for all users in the canyon. We are concerned however, that nothing be done in this process that could limit or degrade the recreation activities WMC members currently participate in.

We believe the long-term transportation solution for LCC must focus on mass transit for all LCC users to the maximum extent possible. A solution must be developed to not only meet the needs of the ski resorts but also the needs of dispersed recreation users throughout the entire canyon. This is a year-round issue and transportation solutions should not just address winter ski area concerns. This transportation EIS process must address this holistic approach.

We support the proposals in this document to improve parking at existing trailheads and other locations to enhance safety, allow additional recreational opportunities, and protect the environment. These projects are likely a once in a lifetime opportunity to improve current conditions and facilitate long term strategies.

We also believe there are short and intermediate steps that will accommodate current needs and ensure easy implementation of a long-term solution. Any solution must include bus stops at the proposed improved trailhead parking areas. Current use demonstrates the need for year-round buses to trailheads and other dispersed recreation locations.

Solutions may need to be implemented in stages. Mass transit requirements need to be implemented soon to alleviate traffic on weekends, holidays, and ski days. In the short to intermediate time frame,

cars should be allowed to access trailheads and dispersed areas, during mid-week and off-peak times. This includes roadside parking necessary for many dispersed activities. We do not agree with UDOT's proposal to eliminate all roadside parking.

Throughout this process, UDOT has used the Cottonwood Canyons Parking Study 2012 for parking requirements. This study is nearly 10 year old with totally outdated parking counts. UDOT is making plans for future recreational use and parking needs without even know what the current use is (for example on Saturday June 27, 2020, there were over 200 cars parked along the road near the White Pine trailhead).

This EIS is trying to develop a solution to manage use without even knowing what the current or future use is.

All users have seen growth of use in LCC and experienced crowds at busy times. Efforts to restrict access to areas within LCC make no sense until we actually know what the capacity is. There is no information on capacity of trails, off-trail backcountry use, or roadside and creek-side use.

We believe efforts to determine carrying capacity of the Wasatch mountains needs to be accelerated - especially of back county users and undeveloped areas users. This must be done to sustain that type of recreation, and transportation solutions must enable these uses.

The other concern we have is to make sure we protect the environment of Little Cottonwood Canyon for future generations. The Wasatch Mountain Club believes it is important to maintain the visible quality of the viewshed contained in Little Cottonwood Canyon. We have made this known throughout this EIS process and recommended that visual assessment be part of the screening process. So far UDOT has disregarded this important and necessary analysis.

A Visual Impact Assessment must be completed in the next phase. As we recommended, it should have been part of the Screening Process, but UDOT refused to do so. It most likely would have disqualified the aerial gondola, so that might explain why it was not done. An aerial gondola would not only affect the aesthetics of the entire canyon with significant cumulative impacts, but would also be visible from much of the Lone Peak Wilderness Area and Twin Peaks Wilderness Area, both considered sensitive areas under NEPA.

According to Transportation Research Board documents "NEPA requires that visual impacts be considered for transportation projects". So why hasn't one been done? This must be done for any design or mitigation processes so should have already been done.

The TRB identifies a number of foundational concepts for Visual Impact Assessments. The first two are:

- 1) Perception of visual quality is an interaction between people and their environment. (this is absolutely true and the EIS process should talk to users of LCC, especially those involved in dispersed recreation who care about the aesthetics of the canyon).
- 2) It is important that the public be directly involved in defining existing visual quality and visual quality management goals and determining visual impact (this has certainly not been done)

UDOT must involve users immediately to establish what viewers value in LCC, what views could be affected by any of the alternatives and how those alternatives will affect the views in the canyon. Doing these simple things immediately will help meet NEPA's aesthetic mandate.

In addition to the TRBs methodology the Federal Highway Administration has Guidelines for Visual Impact Assessment that have not been followed. Here are just two of FHWA requirements:

1.1 “Community acceptance of a proposed transportation project is frequently influenced by the extent of its visual impacts. Anticipating and responding appropriately to these impacts avoids unnecessary delay in delivering needed transportation improvements.”

2.2 NEPA was established, in part, to “assure for all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings” Sec. 101 [42 U.S.C. § 4331]. NEPA is the primary governing rule that established the country's national environmental policy. NEPA requires Federal agencies to undertake an assessment of the environmental effects of their proposed actions prior to making decisions. Visual impacts are included among those environmental effects.”

Obviously, a Visual Impact Assessment must be done and should have been done during the Alternatives Development and Screening phase, and certainly in the Alternatives Development and Refinement phase. Defining alternatives and developing the detailed plans done in this phase should have had the outcome of the VIA in hand.

Utah is fortunate in having high quality digital elevation model (DEM) data for Little Cottonwood Canyon and UDOT certainly has GIS staff that could do the line of sight analysis in a few minutes and make those maps available to the public to determine visual quality affected areas.

The aerial gondola alternative seems to have the greatest visual quality impact. According to Appendix E of this report, gondola towers will be 150 – 200 feet tall. Earlier presentations indicated that some will have to be taller than that; up to 250 feet. These will be visible from many scenic view points and sensitive areas. Also, the cables and gondola cars will obstruct view. No one using the canyon will be able to fix an image in their mind or take a photo without these unnatural obstructions.

The screening process considers characteristics and potential impacts where likely significant effects are identified. The WMC identified visual quality and the need for a VIA as an issue during screening criteria phase of this EIS and our recommendation to include as screening criteria was ignored by UDOT

On a call with UDOT EIS staff on 6/15/2020 we were told by them to make sure we comment on visual impact at this phase. The Wasatch Mountain Club emphatically asks again for a Visual Impact Assessment be done for this EIS. We are hopeful this is done now, with inclusion of all affected users of the canyon to define and analyze visual impacts.

None of the alternatives included in this report are what is needed. And all are way too expensive. Spending nearly \$300,000,000 - \$500,000,000 to get skiers to two resorts is crazy. The goal to have a mass transit alternative to decrease automobile traffic by 30% is way too little of a change. Much more needs to be done to alleviate traffic and at the same time protect access to recreation in the canyon.

For a fraction of the cost of the three proposed alternatives, year-around bus routes from various feeder locations to hubs that serve the resorts, trailheads, and dispersed users, makes more sense. We look forward to participating with UDOT in the next phase of the EIS where this alternative is developed as the preferred solution.

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121

To Whom It May Concern:

I am writing to urge the careful consideration and thorough study of all Little Cottonwood Canyon transportation options. Throughout my time serving in the Utah House of Representatives, I have consistently emphasized the importance of “taking the long view.” Focusing on long-term solutions while considering not only our needs but also the needs of our children and grandchildren will shape our state in critical ways.

One of Utah’s greatest challenges and opportunities is growth. I have watched closely in recent months as various transportation projects have been proposed, including a gondola, a train route, and bus service. While I feel Little Cottonwood Canyon is in real need of mountain transportation, I am not in favor of one alternative over another. Rather, I am strongly in favor of a thorough study and vetting process to clearly evaluate the environmental impacts, and economic benefits, and safety and reliability of each proposal. Utah’s success will continue well into the future as we make decisions with a focus on effective processes.

Thank you for your consideration.

Sincerely,

A handwritten signature in black ink, appearing to read "Brad Wilson", with a long horizontal stroke extending to the right.

Speaker Brad Wilson

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121

To Whom It May Concern:

Here are some advantages I see for approving the gondola solution for Little Cottonwood Canyon based at the La Caille station option:

1. The gondola is a safer, more reliable transportation system despite the canyon weather conditions.
2. Regardless of the reasons for the Highway 210/road closure status, such as avalanches, natural disasters and vehicle accidents, the Gondola will always be open for passenger transportation purposes.
3. The gondola has the smallest physical footprint versus the other transportation solutions under consideration.
4. It is probably the most environmentally friendly option as compared to the carbon-based alternatives.
5. Using the LaCaille Base Station model, the uphill passenger capacity is about 3,500 people per hour (using the LaCaille station parking garage to supplement the bus capacity).
6. The 3S gondola provides re-generation of power on the trip back into the power grid as it downloads passengers to the LaCaille Station.
7. Provides a pedestrian friendly access to the gondola base station through new trail systems decreasing the immediate area's need to use personal vehicles.
8. Further protects the LCC watershed through projected reduction in vehicles.
9. The cost of the Gondola system is by far the most cost effective and has the longest life cycle of any of the proposed alternatives.

Thank you for your consideration.

Sincerely,

Senator J. Stuart Adams
President, Utah State Senate

Quick Bio as it relates to Little Cottonwood:

- *I'm an avalanche gunner on the Howitzer team*
- *I work part time for Alta Ski Lifts*
- *I manage the Trails, Wilderness and Dispersed Recreation program for Little Cottonwood Canyon.*

In this brief comment, I speak as a private citizen and not as an employee.

I appreciate UDOT's work, and I support profoundly your goal to "Deliver transportation options that meet the needs of the community while preserving the values of the Wasatch Mountains"

However the alternatives proposed fall short. They address the much narrower problem of peak traffic on winter mornings and evenings. These traffic jams under avalanche paths are maddening and hazardous, and must certainly be improved.

However, the right transportation solution must do more. It must:

- Address parking issues in winter and summer
- Address recreational needs in the lower and mid canyon as well as the upper canyon
- Provide solutions that are equitable and just
- Protect the integrity and aesthetics of the Little Cottonwood Canyon environment

Parking in Winter and Summer

- In both seasons, all formal parking is filled on weekends and many weekdays. Last weekend there were 150 cars parked on the road at White Pine by 8am. This is not unusual. In winter it is often impossible to park.
- Visitation is projected to increase dramatically with population growth in the Salt Lake Valley.
- The best way to simultaneously protect the environment *and* public access is to have fewer cars without reducing total visitor numbers.
- Strongly incentivized carpooling should be developed.
 - Parking areas should have a fee structure that rewards high occupancy vehicles.
 - If there is a toll, the price should be highest for single occupancy vehicles.
- Public transport in both winter and summer with stops at Trailheads and popular recreation access points should be efficient, easy, and cheap.

Lower Canyon Mobility Needs

- Recreational uses in the lower canyons include: hiking, skiing, snowshoeing, climbing, biking, photography, and families simply escaping to the cool of the creek side.
- These uses are valuable to the health and happiness of our citizenry. They in turn make Salt Lake a desirable place to live and help our economy.
- If parking below entry 1 is reduced from over 543 "stalls" to 240, important recreation opportunities are lost. Alternative access in the form of public transportation, alternative parking, and trail connectivity must replace that access.

Solutions that are equitable and just

- Solutions that improve access to ski areas only are essentially publicly funded subsidies to ski areas.
- Tolling options that use price-point as a “dial” to limit vehicular access will absolutely limit visitation by groups we are actively trying to recruit: minorities, lower-income individuals, families making short visits to picnic and stroll with kids. Certain tolling plans have merit, but *not* if they favor wealthy visitors.
- Any toll or fee structure that allows ski-area pass-holders a cheaper entry is profoundly unjust. The ticket they paid for is for ski area amenities, not canyon access.

Solutions must protect the integrity and aesthetics of Little Cottonwood’s environment

- The road should not be widened. The amount of fill and excavation required to achieve the passing lanes is not worth the benefit to mobility.
- A widened road destabilizes trails above the road (many which have been built with grant money), impacts the riparian environment below the road, and changes the feel from canyon road to highway.
- Parking lot expansion has environmental costs. It is unclear that the environmental impacts of roadside parking are worse than those of bulldozing and paving large new areas.

In light of these concerns, my preferred solution is an expanded version of your “increased bus frequency” option.

- **Do not widen the road**
- **Only limit roadside parking if there is a robust alternative**
 - Many improved formal pull-outs throughout the lower and mid-canyon
 - Cheap, efficient public transport
 - A wide trail from Snowbird to Quarry Trailhead, with spurs to the formalized pullouts and to popular recreation areas
- **Dramatically increase the public transportation opportunity**
 - Subsidize with tolling fees and local taxes
 - Run buses in winter and summer, at a frequency where the average wait mirrors Zion National Park
 - Offer stops at trailheads and popular recreation sites as well as at ski areas
 - Build bus hubs where people will want to hang-out: protected from elements, wi-fi, shops.
- **Increase carpooling through incentives at ski area parking and possibly through tolling.**
 - Very low cost for high-occupancy vehicles, higher for single occupancy
 - All proceeds from tolling should go first to improving and subsidizing public transport, and second to the land management agencies impacted by visitation.
 - In no way should fee structures result in any discount to ski pass-holders.
- **Ski areas should help “flatten the peak” with variable pricing, prorated tickets, staggered openings, or other methods of spreading out the hours during which skiers commute.**

A note on the Gondola

The gondola is an interesting solution and perhaps the best alternative for dealing with future growth. It has a smaller footprint than road widening, and ability to transport many more people. However, your scope does not allow for a full assessment of this alternative. We need to know:

- Can it run in the summer?
- Can it stop at popular recreation hubs?
- Can a single gondola be used to access Big and Little Cottonwood Canyon by passing over (but not letting people out at) Twin Lakes Pass?

If the answer to all these is yes, I would support the gondola. But I cannot support the construction and installation of an aerial line if it fails to address the broader mobility needs of the canyons.

UDOT, thank you for your work and for your consideration of public comments.

Best,

Zinnia Wilson

Re: Little Cottonwood Canyon EIS 2018

Identity of Commenter and an Observation

I am 69 years old and a home owner in the Town of Alta. I drive up and down Little Cottonwood Canyon approximately 90 times a year and have done so for many years. I am an Alta season ski pass holder and I am familiar with the traffic situation in the canyon on winter days, especially when there is new powder. I bought an Ikon pass last year and I am familiar with the bus service in both canyons and the pay-to-park system at Solitude resort.

I believe that the existing road in Little Cottonwood Canyon is adequate 98% of the time. Outside of traffic incidents I have never been in a traffic jam in Little Cottonwood Canyon in the Summer, Spring or Fall, even during the height of Oktoberfest. The traffic problem is limited to winter days – either when there is new powder or a crowded ski weekend day. Yet even on these very worst days when it may take over an hour to get from the mouth of Big Cottonwood to the mouth of Little Cottonwood, once in the Canyon the traffic seems to flow.

These observations on current traffic flows shape my views. I think that it is of critical importance to improve Wasatch Blvd and North Little Cottonwood Canyon Road so that busses can get ahead of any car traffic jams on Wasatch Blvd. Improving Wasatch Blvd is critical regardless of which of the three outlined options is selected.

I do not support additional lanes in Little Cottonwood Canyon because of my experience that traffic in Canyon flows even on the busiest days (barring a traffic incident such as someone without snow tires on a snowy day). While I believe that it is essential to give the busses some means to pass vehicles on Wasatch Blvd, I question the need of dedicated bus lanes in the Canyon. While the canyon road may be near its limit on the very few busiest days, it is adequate without substantial improvements if steps are taken that reduce the number of cars in canyon.

Below are 11 specific comments.

Comment 1: The solution is more people in fewer vehicles. This includes more people using the bus system and incentivizing high occupancy in private vehicles.

With respect to buses you can incentivize people to use them by having a bus service that is frequent, reliable and inexpensive. Reliable service includes service that can bypass the worst of the traffic jams on Wasatch and North Little Cottonwood Road and get to the head of the line at the mouth of Little Cottonwood Canyon. Inexpensive is a relative term, and bus service needs to be inexpensive compared to other options. One means of making this occur is to put a price on driving private cars.

The occupancy of cars can be increased by putting a toll on those who drive up the canyon. This also makes the bus look more attractive.

Occupancy of cars will also increase if cars that are not carpools must pay to park. The pay-to-park scheme adopted by Solitude resort last year should in some form be adopted by Alta and Snowbird. There may be other means to get more people in fewer vehicles that should be explored. A “Busses Only” rule in effect for the first few hours of each day would reduce the number of cars. Please note that all of these steps, except for building another lane or a bus lane between the mouth of Big Cottonwood and the mouth of Little Cottonwood, are very inexpensive compared to the options outlined in the EIS.

Only after these steps have been taken and have been found to be wanting should UDOT consider an enhanced bus lane in the Canyon or an aerial tramway. Go for the low hanging fruit first before expensive “fixes” that may not be necessary if better bus service, tolling, charging for non-carpool parking and like do not solve the problem.

Comment 2: Stage some of the improvement and be flexible. UDOT should make some of the improvement before others. For example, UDOT could improve Wasatch Blvd and North Little Cottonwood Road, implement tolling and/or fees based parking, then wait and see how much the traffic is reduced. UDOT can then analyze how well the improved system works before the massive expenditures on other options such as the aerial tram or additional lanes in the Canyon.

Comment 3: The goal of getting 30% of the cars off the road by 2050 is far too low. This is an absurdly low goal in light of the amount of the proposed expenditures under any of the options.

The tools discussed above could get 30% or more cars off the road in short order. These include 1) reliable, frequent and inexpensive bus service 2) bus service that can bypass any traffic jam on Wasatch Blvd. and North Little Cottonwood Road, 3) tolls so that there is a cost to taking an automobile up the canyon, and 4) fees to park at the resorts if the car is not a carpool (as Solitude

resort implemented last year). Some combination of the use of these tools could significantly reduce the number of vehicles in the canyon.

Comment 4: Yes, yes, yes to the intermodal hubs and parking structures. This is a crucial step to get more people out of their cars and into busses. In addition to the two planned hubs, consider (re)purchasing the large no-man's-land between Olympus Hills Mall and I-215 and adding 39th south to the possible parking areas. The existing park and ride at 39th south for UTA could be expanded if UDOT (or the County?) staging area for snow plows were moved and the park and ride tripled in size.

Comment 5: Expansion of Wasatch Blvd and North Little Cottonwood Road. The residents in this area are concerned about this corridor becoming a highway and are urging that it be kept as a two lane "street" and not be a road. Efforts to accommodate the residents in this area should be made, but it is absolutely essential that at a minimum a south bound bus lane be constructed. The SaveNotPay group seems to recognize this in their literature. To reduce the "highway feel" in this area consider lowering the speed limit on North Little Cottonwood Road from 50 to 40 mph. It is already 40 in the Canyon and 40 at northbound cars approach Wasatch. Make it consistent. And while taking what action you can to appease the people who have chosen to live by the road to the ski resorts, expand Wasatch Blvd and North Little Cottonwood Road.

Comment 6: Snow sheds do not appear to be worth it. An expenditure in the range of \$100 million dollars for snow sheds increases the likelihood that skiers will have better access to the ski resorts for about 5 days each year. Even that is no guarantee. Some years there are no major avalanches so the sheds are not needed. Other years the slides are plentiful, but the snow sheds do not guarantee that there will be resort access. In the 2019/2020 winter the sheds as outlined in the EIS would have protected the road from only 40% of the slides, so resort access would still have been reduced for 2 or 3 days anyway.

Remember also, this is not a vital route connecting two major cities – this is a road that serves two privately owned ski resorts. If the road were closed for a few days what's the big deal? It is part of the adventure. Most of the visitors will have a story to tell about how they got stuck for an extra night or two at a ski resort or could not get there immediately upon arrival. The inability to travel to the resorts for a few days each year is an acceptable risk when considered in light of the cost of the snow sheds.

Comment 7: The EIS fails to adequately evaluate or consider the impact of charging a toll to drive up the canyon. If a goal of the project is to reduce the number of cars in the canyon, tolling is a very important tool that should be implement. Tolling is one of the factors that makes the bus seem like a better deal. The EIS should not gloss over this option but include realistic plans to implement tolling.

Comment 8: Charging for parking. The EIS does not adequately consider how charging for parking would reduce the number of cars in the canyon. Charging for parking tends to incentivize people to use the bus and incentivize car pooling. While it is true that the parking lots at the ski resorts are not under the control of UDOT, UDOT could work with the resorts to implement fee based parking.

Think about it this way: UDOT is considering spending hundreds of millions of taxpayer dollars to built facilities to help ensure a steady and efficient flow of skiers to two privately owned ski resorts. The resorts are a primary beneficiary of this whole project, whatever option is selected. Because of this UDOT is compelled to work with the resorts to implement some fee based parking scheme. As part and parcel of the expenditures to benefit the resort the resorts must be called upon to assist in the project to reduce the number of cars in the canyon, and charging for parking is a proven method of reducing vehicles.

Comment 9: UDOT must consider the impact of traffic regulations as part of the EIS. Traffic regulations are a means of solving some of the congestion problems and need to be considered in the EIS in addition to the focus on building infrastructure. The issue of road side parking can to used to illustrate this point.

The EIS calls for expansion of the White Pine parking lot to reduce the number of cars parked along the side of the road in Little Cottonwood Canyon. UDOT says roadside parking creates a danger year round and in addition in the wintertime it hampers snow removal.

It is questionable whether a parking lot could be constructed that would meet peak demand for this popular hiking and backcountry trailhead at White Pine. It is an environmentally sensitive area so the size of the parking lot has to be weighed against environment consideration. Let's assume UDOT gets approval to build the largest parking lot set forth in the EIS. What happens if this expanded parking lot does not meet peak demand? The options are to prohibit roadside parking and have the parking lot be first come first serve, so some folks would find that they need to abort their planned adventure up White Pine when they arrive too late to find a parking stall. Another option is to continue to allow road side parking in the summer months for overflow demand.

Continuing to allow roadside parking, which is a matter of traffic regulation, may be the best option, regardless of whether or not the White Pine trailhead parking lot is expanded. The speed limit in this area (traffic regulation) could be reduced. The limit is currently 40 mph but the area is just several hundred yards from the point before Snowbird where the speed limit on 210 is 30 mph for the balance of the road to Alta, where it drops to 25 mph.

This area with roadside parking could also be managed something like a school zone and have flashing signs that reduce the speed limit to 25 mph on those summer weekend days when everyone seems to want to go White Pine. That would be a better solution than banning road side parking.

Does UDOT propose to treat Snowbird's Octoberfest the same way it treats backcountry enthusiasts using the White Pine trail head? Currently for roughly six weekends each fall roadside parking is permitted along the entirety of Little Cottonwood Canyon Road in the Snowbird Area, and it is often full to capacity. Roadside parking is also permitted there during the ski season. If UDOT bans roadside parking at White Pine it seems logical that it must also ban it near Snowbird, possibly in both winter and summer.

A better solution is not to ban roadside parking in its entirety but manage any safety concerns through traffic regulations and enforcement, and these should be addressed in the EIS. Allow roadside parking near White Pine when the parking lot is full. Deal with the safety issue by treating the area like a school zone and significantly lower the speed limit at certain times. (How much of a rush does anyone need to be in when they are only a mile or two away from their recreational destination?) Similarly, permit roadside parking at Alta and Snowbird. Deal with any safety concerns this creates through traffic regulations and enforcement.

While I have long thought that roadside parking was preferable to paving national forest lands with parking lots, I am impressed with the recently constructed parking lot at Rattlesnake Gulch in Millcreek Canyon and recognize some expansion of the parking lot at White Pine is inevitable.

Comment 10: The aerial tram is a dubious solution with multiple drawbacks. The Tram is very expensive when compared to other options. This is especially true if we accept that a few days each year without access to the resorts by car due to avalanches, which is inconvenient, does not mean that a \$100 million investment in snow sheds is worth it. Without snow sheds on the road the Tram is by far the most expensive option. Since the problem can be solved by the much less expensive steps outlined elsewhere in these comments, the expensive tram option should be discarded.

The Tram serves only the resorts. It does not solve any other canyon transportation uses. The Tram would take longer than cars, especially since access to the tram is likely only by bus. Why would someone get out of their car and take a bus, then transfer to the tram, when they could stay

either in their car or on the bus and get to the resorts faster? Consequently the use of the tram by skiers is unknown. It may assist getting skiers to the resorts on a few snowing days but otherwise is a dubious proposition. While one can imagine a few days each year where the roadway is jammed up and a few happy skier bypass the traffic by getting to the tram, overall this expensive option is little more than a Disney ride. UDOT needs to focus on solving the transportation problem, not building an amusement park ride.

Comment 11: This whole process may be flawed because there has not been a study to determine the ecological limits of humans in the Canyon, also referred to as the “carrying capacity.” The EIS seems to presuppose no limits. Considering determining these limits before building more infrastructure.

Respectfully Submitted,

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, Utah 84121

To Whom It May Concern:

I would like to express my favor for the gondola option based at the La Caille station as the solution for Little Cottonwood transportation for the following reasons:

The gondola is a safer, more reliable transportation system despite the canyon weather conditions. Not to mention pedestrian-friendly access available to the gondola base station through the new trail system which decreases the immediate area's need to use personal vehicles. Reducing the number of vehicles and removing all the buses in Little Cottonwood Canyon is also an environmentally friendly option. This eliminates the need to expand Highway 210 into a larger right-of-way that would increase the vehicle count within the canyon.

In the end, the cost of the gondola system is the most cost-effective with the longest life cycle of any of the proposed alternatives. The gondola will make the canyon accessible to locals and tourists and showcase incredible landscapes. I am confident that the project will highlight recreation while solving the transportation problems in the area. I support the gondola station option for Little Cottonwood Canyon.

Thank you for your consideration.

Sincerely,

A handwritten signature in black ink that reads "Deidre Henderson". The signature is fluid and cursive, with the first name "Deidre" and last name "Henderson" clearly legible.

Sen. Deidre Henderson
Utah State Senate District 7

MEMORANDUM

Date: July 10, 2020

To: UDOT Little Cottonwood Canyon EIS Team

From: Hales Engineering

Subject: **Public Comment – North Little Cottonwood Road Gondola Station**

UT20-1706

Introduction

This memorandum introduces public comment for the Utah Department of Transportation (UDOT) Little Cottonwood Canyon Environmental Impact Statement (EIS). This comment presents an opportunity for UDOT to locate the base station of the proposed Little Cottonwood Canyon gondola system along North Little Cottonwood Road (S.R. 210) in Cottonwood Heights, Utah. The proposed site for the gondola base station is shown in Figure 1.

Figure 1: Proposed base station site vicinity map

Gondola Base Station Opportunity

The proposed gondola base station site is located southwest of North Little Cottonwood Road (S.R. 210) at milepost (MP) 3.1. This opportunity for the proposed gondola base station site is consistent with gondola alternative 2 of the *Alternatives Development and Screening Report*. This opportunity is being presented by CW Management Corp. who are working on plans for redevelopment near the site. A concept of the proposed layout of the site is shown in Figure 2.

The site would feature the gondola base station along with other amenities. The concept plan proposes having 10 roadside loading zones on each side of S.R. 210 to maximize public transit opportunities. A tunnel is being proposed from the northeast side of S.R. 210 to get pedestrians safely across to the gondola. In addition, an on-site parking structure is being proposed with a supply of approximately 1,600 parking stalls. This will add to the already proposed parking supply at the two mobility hubs on Highland Drive and near Big Cottonwood Canyon.

To access the site, it is being proposed that a traffic signal be installed at approximately MP 3.15 on S.R. 210. In addition, a right-in only access is being proposed at approximately MP 2.96, and a right-out only access is being proposed at approximately MP 3.08. In addition, direct ingress and egress tunnel accesses are being proposed to the parking structure from North Little Cottonwood Road. Southbound traffic could use the ingress tunnel access, and northbound traffic could use the egress tunnel access.

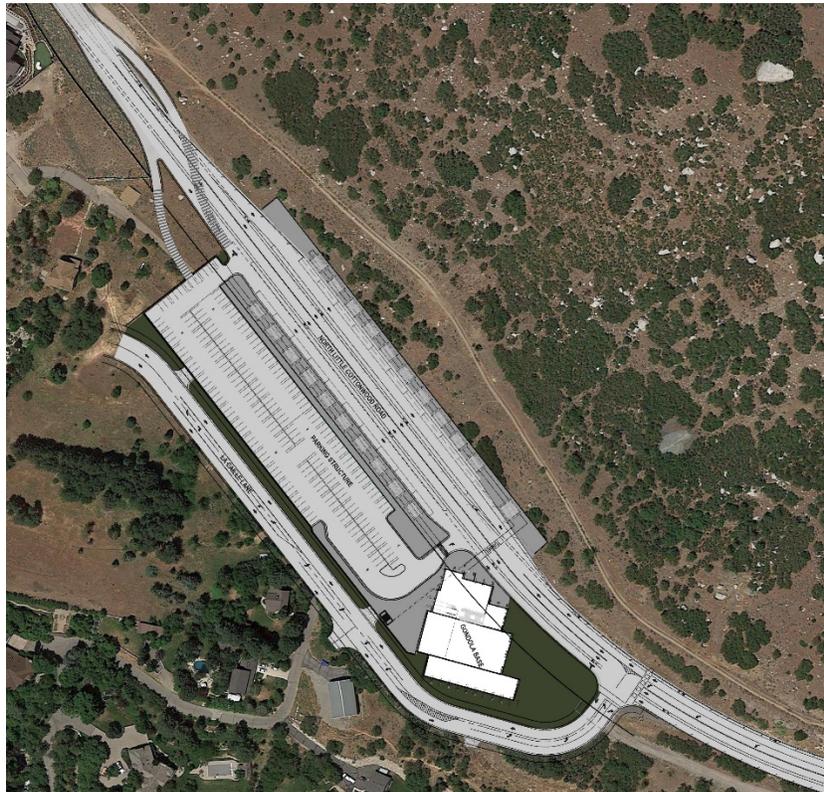

Figure 2: Base station site concept

Gondola Benefits

As outlined in the preliminary documents for the Little Cottonwood Canyon EIS, a gondola system through Little Cottonwood Canyon is a viable alternative to increase the capacity of traffic flow in the canyon now and in the future. The gondola has been identified by UDOT as the most feasible Aerial Transit System (ATS) for the canyon. The following sections outline some of the benefits of a gondola system:

High person travel capacity: The proposed tri-cable (3S) gondola system has a maximum hourly capacity of approximately 5,000 people per hour per direction. With the 30th-busiest hour in 2050 having a projected demand of 3,200 people per hour (equivalent to 1,555 vehicles per hour), the gondola could handle this demand on its own if needed. UDOT indicated that there would be about 1,050 people on gondolas in the peak hour.

Mitigates avalanche impact: With the gondola travelling above ground, avalanches will not impact the operation. When an avalanche closes S.R. 210, the gondola could provide a great benefit to the corridor by carrying the anticipated future demand through the canyon.

Consistent travel time: Without a gondola, travel times will vary based on the demand or avalanche conditions. A gondola would provide a consistent travel time for riders to expect, even when demand is high.

Mitigate parking issues near the ski resorts: In existing conditions, the parking at the resorts fills up quickly on busy ski days. This causes drivers to park unsafely along S.R. 210 adjacent to the ski resorts. With a gondola, the ski resorts could charge for parking and S.R. 210 could be tolled to incentivize people to ride the gondola, eliminating existing parking issues in the canyon.

Provide safer alternative to driving an adverse conditions: In 2018, there were 52 crashes on S.R. 210 in Little Cottonwood Canyon. Half of these crashes (26) occurred when the roadway surface was icy, snowy, or wet. Approximately one-third of the crashes (17) occurred when it was actively snowing. With traffic continuing to grow each year in the canyon, the risk for crashes will continue to increase. Providing a gondola system to ride as an alternative to driving would give drivers a safer alternative to driving up the canyon, especially for those that may not have vehicles that handle well in snowy conditions.

North Little Cottonwood Road Base Station Benefits

Though UDOT chose to move forward with gondola alternative 3B (additional parking at gravel pit and bussing to base station at mouth of the canyon) in the EIS, it is recommended that UDOT reconsider gondola alternative 2, which could utilize the site being proposed by CW Management Corp.

The following sections outline the benefits of a base station on North Little Cottonwood Road:

Parking supply: The proposed concept shows a parking structure with approximately 1,600 parking stalls adjacent to the gondola with easy access from each parking level to the gondola. Implementing this parking at the site plus other parking at the mobility hubs will provide sufficient parking for the demand and decrease the parking need at the resorts.

Public transit integration: The concept proposes a high public transit capacity for buses dropping off and picking up at the gondola site. This will provide a good connection from the base station to the outer mobility hubs for riders to travel to and from the gondola.

Overall cost: As outlined in the *Alternatives Development and Screening Report*, gondola alternative 2 has the second-lowest capitol cost and tied for the lowest operation and maintenance (O&M) cost out of all the alternatives. The report identified alternative 3B as having the second lowest capitol cost erroneously, as 3B actually tied for the third-lowest capitol cost behind alternative 2.

Travel time: As outlined in the *Alternatives Development and Screening Report*, gondola alternative 2 has the second-fastest travel time to Alta.

Traffic congestion impact: The *Alternatives Development and Screening Report* assumes that a base station on North Little Cottonwood Road would not change the existing travel patterns that result in high traffic volumes at the entrance of Little Cottonwood Canyon, and marks alternative 2 as having a “high” impact on traffic congestion. However, by having the base station approximately three-quarters of a mile northwest of the entrance to the canyon, the bottleneck S.R. 209 / S.R. 210 intersection will experience a sharp decrease in traffic volumes, resulting in less congestion. Traffic coming from Interstate 215 (I-215) on Wasatch Boulevard can make a right-turn into the site prior to arriving at the S.R. 209 / S.R. 210 intersection. The proposed traffic signal at the site and the northbound egress tunnel access can facilitate left-turn movements out of the site in the afternoon and evening hours for cars to go back to Interstate 215 (I-215).

Conclusions and Recommendations

The following are the key points from this public comment memorandum:

- The proposed site adjacent to North Little Cottonwood Road is ideal for the Little Cottonwood Canyon gondola base station
- The site would feature the base station, a parking structure, and public transit loading zones with one signalized and two unsignalized access points
- It is recommended that a gondola system be pursued for the canyon to provide a high person travel capacity, mitigate avalanche impacts, provide a consistent travel time, mitigate parking issues at the resorts, and provide a safer alternative to driving.
- It is recommended that UDOT reconsider their gondola alternative 2 as an option and consider this proposed site for the base station due to its parking supply potential, public transit integration, and its comparative cost, travel time, and traffic congestion impacts.

**RE: UDOT Project Number S-R299 (281) /UDOT PIN 16092
Little Cottonwood Canyon (SR 210) Environmental Impact Statement**

Comments on the Draft Alternative Development and Screening Report, dated June 8, 2020

Vince:

As a Participating Agency to the SR 210 Environmental Impact Statement, the Wasatch Front Regional Council (WFRC) thanks you for the opportunity to comment on the Draft Alternative Development and Screening Report. Provided below are comments from the Wasatch Front Regional Council staff.

We would like to thank the Utah Department of Transportation (UDOT) for their leadership and commitment in addressing the growing transportation needs across the state and particularly along the Wasatch Front. The significant effort dedicated to the Little Cottonwood Canyon (LCC) Environmental Impact Statement (EIS) is further evidence of UDOT's commitment to identify solutions to the transportation-related safety, reliability, and mobility concerns in LCC and on Wasatch Boulevard.

As the Metropolitan Planning Organization (MPO) for the greater Wasatch Front Region, WFRC's role is to plan for an integrated transportation system including roadway, transit, active transportation, and other facility improvements to meet projected travel demand over 30 years, with consideration of land use, air quality, economic development, and other factors relevant to quality of life.

Understanding the focused, defined purpose and need of the LCC EIS, we acknowledge that the MPO's goals and responsibilities in planning for long-range transportation, in terms of geography and objectives, are broader. The Regional Transportation Plan takes into consideration transportation, land use, the economy and the relationship between all three. It focuses on accommodating and best serving the needs of all users along the Wasatch Front.

We are not at this point recommending any particular alternative for implementation. We support a comprehensive analysis of and narrowing of the alternatives. Our primary comment is that we believe it would be beneficial to move forward into the next phase a rail alternative for further and more in-depth analysis, along with the other options identified.

When focusing specifically on LCC, as in the EIS, the potential broader regional impacts and benefits of a rail transit alternative may not adequately be recognized. In that broader sense, rail has the potential to integrate the regional transportation system that serves users

throughout the region, from the Salt Lake International Airport, the Central Business District, residential and business locations west, north, and south, to the canyons, including the potential for eventual connection of LCC to Big Cottonwood Canyon and Park City - and the connection of residents, visitors, and workers among all these points through a transportation mode other than the automobile. With this larger perspective we encourage consideration of a rail alternative in the next phase of the LCC EIS.

The LCC EIS Draft Alternatives Development and Screening Report and its numerous appendices speak in great detail evaluating and comparing alternatives. The analysis of ridership, cost, alignment, speed, and natural and built environment impacts, while detailed, trend toward the raw evaluation criteria and given limited consideration to any potential for mitigation, particularly for a rail alternative. For example, evaluating limited alignments for rail in the Draft Rail Transit Concepts Initial Feasibility Study (Appendix F of the Draft Alternatives Development and Screening Report) may not provide the optimal alignment, with the least impacts. Nor is double tracking the entire alignment from the Historic Sandy TRAX Station to Alta going to provide comparable cost estimates with other alternatives.

In the Screening Report, the reasons stated for not advancing rail for further evaluation in the Draft EIS are the higher number of home acquisitions, Section 4(f) impacts, historic property impacts, and cost. While these are important and valid factors that raise concerns that could affect level 2 screening, these impacts also have the potential of being mitigated in a more robust analysis of alignments and track configuration in the Draft EIS and preliminary engineering process.

While the Draft Alternatives Development and Screening Report identifies year-round improvement for Wasatch Boulevard and within LCC, the major capital investment of enhanced bus, gondola, and rail are all focused on the need to decrease traffic during peak periods during the ski season. In this regard, little to no consideration is given in the Screening Report to the year-round mitigation of traffic and congestion in the canyons, which a rail alternative could have the potential to improve.

With cost being one of the stated reasons not to advance a rail alternative for further evaluation in the Draft EIS, we question why the cost analysis for a COG rail option is significantly higher (more than double) that from previous studies conducted in recent years. Alignment certainly makes a significant difference, which suggests investigation of alternative alignments. Additionally, while the initial capital cost is higher for rail, there does not seem to be consideration given to the lower annual O&M costs and the life cycle cost, for any of the alternatives. A more vigorous cost analysis along these lines, for all of the alternatives, would likely provide a more equitable comparison of alternatives.

While our comments are directed toward rail, we want to emphasize again that we are not advocating any particular alternative. As the MPO, our responsibility is to look more broadly at the regional transportation system. We see the potential for rail to provide additional regional benefits, which leads our review to suggest that a rail alternative warrants further evaluation.

Again, thank you for the opportunity to provide comments and participate in this important study. WFRC looks forward to our continued participation.

Ned E. Hacker

RE: Little Cottonwood Canyon Environmental Impacts Statement
Comments regarding Draft Alternatives and Screening Reports

Dear Josh Van Jura and LCC EIS project team,

The Central Wasatch Commission (CWC) is grateful for the opportunity to provide written comments on the Alternatives and Screening Reports of the Little Cottonwood Canyon Environmental Impact Statement (the Alternatives Report). We would like to first acknowledge the tremendous effort the EIS team has put into the process to date. The team has been accessible to, and coordinated with, the CWC as we work on a parallel effort for a Mountain Transportation System (MTS). The information presented in the Alternatives Report is greatly informative and will be helpful to make decisions moving forward. We appreciate the UDOT work and recognize the challenges of developing objective, good information and analysis and the enormous scrutiny when following a NEPA process and making decisions for the Wasatch Boulevard-Little Cottonwood Canyon corridor. Your work will serve the CWC and the communities well as key decisions are made for our MTS.

The CWC is an interlocal government of nine local governments in and adjacent to the Central Wasatch Mountains. The Board consists of elected officials from those jurisdictions, including the Mayors of Salt Lake City, Salt Lake County, Millcreek City, Cottonwood Heights, Brighton, Alta, and Park City. The remainder of the Board are Council Members from Salt Lake County, Summit County, and Sandy. The CWC is an outgrowth of the Mountain Accord agreement. The Mountain Accord was a historic planning effort that achieved consensus in 2015 on the recreation, transportation, economic, and conservation solutions for the Central Wasatch Mountains.

Building from the transportation principles of the Mountain Accord, in January 2020 the Central Wasatch Commission began to fulfil its mission to develop a mountain transportation system envisioned in the Mountain Accord. The CWC believes a mountain transportation system should integrate with the regional transit system, operate year-round, and provide equitable access to recreational opportunities and economic nodes while protecting the communities, watershed and the quality of water used by hundreds of thousands of residents downstream. To help with this effort, we've assembled a technical working group of mode and transportation management experts, vendors, planners, and policy makers to not only help develop the CWC's MTS but to also aid and provide input on the EIS process.

The Central Wasatch Commission is not advocating for a specific solution at this time. Like UDOT, the CWC is considering a range of alternatives without a bias or pre-conceived notion of outcomes. The process, we hope, will lead to the best possible decision.

The CWC is framing these comments based on the results of scoping for the MTS that were adopted by the Board in April 2020. Attributes and objectives of a successful MTS were developed through scoping of the MTS initiative, stakeholder and public comment, and extensive Commissioner discussion. These are the same attributes and objectives the CWC will use to evaluate mountain transportation system alternatives in the coming months. Additionally, the MTS initiative takes a more regional approach, with the LCC EIS being a part of the larger regional transportation system. The CWC is also reviewing the draft “reasonable range of alternatives” in the context of the scoping, purpose and need, and screening criteria identified previously by UDOT -- and our comments on those steps in the EIS process.

It is our hope that the following comments and recommendations will help shape the next phase of the EIS process, as we strive to reach a consensus on a transportation solution that is so greatly needed in these mountains.

Comments from the CWC are outlined in the following topics in this document:

- Alignment of UDOT scope, purpose and need, and screening criteria with the CWC’s MTS initiative
- Protection of a critical environment, with particular emphasis on the watershed
- Questions regarding alternatives screening process
- A range of reasonable alternatives
- Relationship between demand management strategies, modes, and equitable access
- Broader regional transportation needs and system integration

The CWC is providing a summary and examples of our comments. As a participating government in the LCC EIS, we are available to provide substantial additional detail and discussion, including the inclusion of experts, so that some of the variations we see between information and analysis can be fleshed out and reconciled.

Alignment of scope, purpose and need, and screening criteria

The LCC EIS alternatives have gone through an extensive process to date. Scoping, purpose and need, and screening criteria for this process were developed during the fall and winter of 2019 and public comment was accepted on the developed screening criteria. The CWC provided comments that reflected the consensus of the CWC member jurisdictions.

There is much alignment between the screening criteria and scope of the LCC EIS and the interests and objectives of the CWC. The CWC supports the goals of improving the safety,

mobility, and reliability of travelling along Wasatch Blvd and SR 210 in the Little Cottonwood Canyon corridor.

As noted in prior CWC comments, there are still a few important elements that CWC believes need to be considered during the EIS process. In our comments during the scoping and screening process, the CWC requested that a larger regional approach be considered in evaluating an effective result for the LCC EIS; a Wasatch Boulevard-LCC road corridor decision does not occur in isolation. The indirect and cumulative effects from the LCC EIS should address how a broader transportation system, now and foreseeable, is impacted, A year-round mountain transportation system that serves all users, integrates with the regional transportation system, and considers watershed and water quality protection should be part of primary screening criteria for a reasonable alternative.

It was recognized by members of the CWC and its Stakeholders Council, and reflected in previous comments to UDOT, that a significant reduction of automobiles was necessary for the future benefit of LCC. A system needs to be designed and developed to meet current and future recreation demand, and it should be recognized that mobility, reliability, and safety needs exist beyond just one season.

The UDOT LCC EIS makes the goal of reducing peak congestion times during winter a primary objective. However, while reduction of peak periods of that seasonal traffic is important, Little Cottonwood Canyon transportation serves many uses and users on a year-round basis. In addition, decisions that are made with respect to LCC will impact the numbers of users in LCC, as well as in adjacent BCC and other Central Wasatch Mountain areas. For example, we are seeing a spike in users in these mountains during COVID 19, an indication of future use and impacts that should be considered as part of the LCC EIS. All of these concerns should be considered.

CWC believes the LCC EIS should, as part of its alternatives screening, broaden the criteria for elimination of an alternative to include impacts that could not be mitigated on the watershed or environment. Please see the detailed Salt Lake City Department of Public Utilities and Sandy City comments in this regard.

Protection of a critical environment, with particular emphasis on the watershed

Salt Lake City, a member jurisdiction of the CWC (and with its partners Sandy City and Metropolitan Water District of Salt Lake City and Sandy), is the watershed manager for the Central Wasatch Mountains. Salt Lake City has legal jurisdiction within Little Cottonwood Canyon related to its water rights, watershed management, water infrastructure, and provides specialized expertise within the LCC EIS study area. The CWC shares our member jurisdiction's concern in that waiting to apply watershed and water quality standards, until the secondary screening, risks selecting an efficient transportation model but a substandard model for water quality.

The CWC supports SLCDPU comments regarding climate change, impacts to water infrastructure, road widening, parking, cost/benefit, and questions regarding watershed impacts from the gondola system and snow sheds.

Questions regarding screening process

There appear to be several instances in the Alternatives Report when the alternatives were not compared equally in the screening process. Please consider whether this was done. For example, we have received information that suggests that the cost analysis is uneven and does not use consistent life-cycle costing with the 2050-time horizon that the EIS has established.

Another example: the starting point for indicating rail is the existing middle-of-the-Valley rail station, but the starting points for buses and aerial systems are the mouths of BCC and LCC. In addition, it is presumed in the bus and aerial alternatives that the project would occur in the roadway corridor, but for rail, the assumption seems to have been that a separate right of way would be required. It is our understanding from talking to transit experts (bus, aerial, and train) that rail could be accommodated in the road right-of-way, and that aerial might need to occur in places away from the road right-of-way.

CWC is prepared to provide more detailed information regarding this issue, and we have seen information from the experts consulting with the CWC for our MTS that is substantially different from the analysis in the Alternatives Report. We have asked for more detailed analysis to help us reconcile the differences; to date, we have been told that the Alternatives Report represents all the information of UDOT and its consultants.

Range of reasonable alternatives

There is limited information available for how UDOT applied the screening criteria to arrive at the Reasonable Range of Alternatives. In spite of that, we agree in general with the continued analysis of the three alternatives put forth in the Alternatives Report, i.e., the bus and gondola alternatives. However, we do have concerns as to why some form of a rail alternative was not carried forward for further analysis.

From what has been communicated, there seems to be three main reasons why cog rail was eliminated. Those reasons are listed below with comments associated with each reason.

- F(4) impacts
 - Pursuant to information provided by CWC's consultants and partners (and prior information provided to UDOT), we believe that potential impacts may be able to be adequately addressed through a different alignment that avoids F(4) impacts.
- Number of homes needed to be purchased
 - The conclusion made with respect to this issue appears to have assumed that rail would not be placed in existing road rights of way. The rail analysis that CWC has seen includes options to develop rail in existing rights-of-way, thereby potentially avoiding

extensive private property purchases. Further, options for buses, aerial, and associated parking all contain the potential of private property acquisition (although possibly to a lesser extent than a train option). In fact, UDOT is considering acquiring property at the mouth of BCC pursuant to a State appropriation for parking and ancillary facilities now.

- Capital costs
 - We question the accuracy of estimated costs and lifecycle costs (time horizon in EIS is 2050) and believe that the total cost for each alternative (life-cycle costs) should be evaluated equally. Experts advising CWC have provided dramatically different estimates of capital costs than are reflected in the Alternatives Report. CWC requests that UDOT re-evaluate the capital cost analyses to address these disparities.
 - As noted above, the Alternatives Report appears to rely upon different assumptions for cost comparisons of the different modes. In addition, it appears as if information provided to CWC in some cases is different from the information and analysis by UDOT's consultants. Please consider some of the expert analyses provided by other agencies (especially UTA), mode experts (Doppelmeier and Stadler Rail), businesses (e.g., Alpentech), and private organizations.
 - The analysis and conclusions in the Alternatives Report differ from what has been provided by the experts advising CWC. While we see detailed numbers as conclusions by UDOT, they do not square with what our experts believe to be commonly accepted capacity and timelines for moving people by different modes. For example, buses, by the UDOT consultants' own analyses, have a limited capacity to meet the needs in the 2050 timeframe without an unacceptable traffic condition. In addition, our expert advice suggests the availability of significantly greater rail and aerial capacity than reflected in the Alternatives Report.

Based on expert analysis provided to CWC as part of our MTS work, the CWC recommends that some form of rail system should be included in the final list of range of reasonable alternatives. Please note that this recommendation does not reflect a disagreement with the elimination of the specific rail alternatives that were considered in the Alternatives Report. Rather, it is our opinion that the Alternatives Report did not adequately consider other potentially viable types of rail options (e.g., a rail option that has a different start and end point, or an option that utilizes a different path of travel or alternate technology). CWC agrees, however, that the potential negative impacts of a rail system (as noted in the Alternatives Report), such as costs, travel time, congestion, and negative impacts on natural and built environments, should be evaluated.

While considering the alternatives, the screening process, future growth, and the objectives for the CWC and UDOT, the CWC is concerned that the projected number of automobiles in the canyons will increase over existing, unacceptable numbers for the 2050 timeline. The CWC feels the reasonable alternatives and objectives of the EIS should be more aggressive in reducing the number of automobiles in the canyon.

The CWC is concerned about the ability of the bus alternatives to meet demand created from additional automobile reduction, and, as a result, these options' ability to meet and maintain the reliability, mobility, and safety objectives outlined in the Alternatives Report.

This includes accessing an aerial system via bus. It seems the aerial alternative is limited by the bus system's capacity to deliver passengers to the base station. In the aerial alternative, only 1/5th of the maximum capacity is being met because the bus is limited in being able to deliver 1,000 passengers per hour. Other approaches to this issue, including the report issued by the "Gondola Plus La Caille" group, have a different approach that might better maximize the capacity of an aerial system. (This analysis deserves evaluation.) Furthermore, the Gondola alternative does not include a full analysis of traffic movements and parking at the Gondola station and additional impacts on traffic along Wasatch Blvd. This information would be critical before giving further consideration.

Avalanche missions also play a critical role in the ability to move up and down the Canyon. The CWC requests that further evaluation be considered in regard to how each of the alternatives could operate during avalanche detention. For example, gondolas could not operate or have any passengers on board while avalanche crews are blasting heavy artillery overhead. Does the gondola option allow for improved access for first responders? Please continue to consider and further refine emergency access and egress for residents, visitors, workers, and first responders.

We also recommend that UDOT consider a phased approach in its analysis. Bus options serve a purpose within a larger regional transportation structure (along with other modes and demand management strategies) and could serve a role in both short-term and long-term solutions. For example, should there be a phasing consideration (e.g., 5-10 years mitigation with longer term solution)? Early in the LCC EIS process, UDOT was embarking on short- and long-term strategies. Given the long timeframe (5-10 years) to implement any of the alternatives due to capital investment, planning, design, and operational considerations, it would seem wise to consider a phased approach to a transportation solution for the LCC EIS.

The CWC would also like to address the question of whether all alignments were considered or just roadway alignments. It is understandable from a NEPA-simplicity perspective to avoid Forest Service lands and impacts that UDOT's consultants would try to keep all alternatives within the road right of way. However, it should be noted that the aerial alternative departs significantly from the existing roadway corridor. In addition, avoiding Forest Service lands may not result in the best transportation solution. As noted in other parts of these comments, the impacts on Forest Service lands from increasing the number of users in LCC may necessitate (and CWC would advocate should require) a consideration of impacts beyond the ski areas. CWC would suggest that UDOT and its consultants determine and evaluate the

best possible alignment for each alternative that meets the purpose and need and avoids irreversible negative impacts on LCC.

A critical corridor of the LCC EIS is Wasatch Blvd. In July 2019, Cottonwood Heights, a member of the CWC, adopted the Wasatch Boulevard Master Plan which UDOT has included during the EIS process. Important aligning priorities for Cottonwood Heights and the CWC for the Wasatch Blvd. corridor include transit-prioritized roadway capacity instead of unnecessary road widening, improve multi-modal access for the surrounding neighborhoods, traffic calming measures to slow travel speeds, and improve active transportation network along corridor. The CWC shares Cottonwood Heights concerns about the impacts to the residents who live along and adjacent to the corridor and request that further analysis be prepared about mobility improvements for residents.

Relationship between demand management strategies, modes, and equitable access

Tolling and parking strategies have been included in the LCC EIS process and have screened through as part of the package of range of reasonable alternatives. These strategies certainly align well with disincentivizing vehicles, an attribute outlined in the attributes in the MTS.

A top attribute of the CWC's MTS work is equitable access. Tolling can be considered a regressive tax which takes a larger percentage of income from low-income earners than from high-income earners. The CWC is concerned that tolling SR 210 will limit people's ability to access a National Forest.

Additionally, all of the alternatives presented make it difficult for all users to take advantage of the transit services. In order to use any of the alternatives in the proposed Reasonable Range of Alternatives, users must use personal vehicles to access the transit services.

The CWC is also curious to know how the alternative transit modes would be successful or not with the accompaniment of a tolling strategy. The CWC supports an analysis that considers minimizing the unintended consequences of tolling.

Broader regional transportation needs

The CWC is concerned that the decisions made during this NEPA process will have an indirect and cumulative impact on the surrounding region and are not being considered. How will any of these alternatives impact Big Cottonwood Canyon? The Ikon Pass and Epic Pass allow skiers to access all of the ski resorts any day and even allow for multi-resort visits within one day. Certainly, tolling will have an impact on motorists' decisions if they pay the toll, take a transit alternative, or drive up Big Cottonwood Canyon or to Summit County.

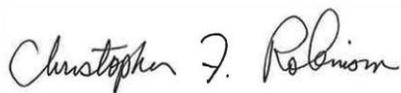

Additionally, visitors and residents are increasingly using these canyons and mountains year-around. In fact, visitation to the Cottonwood Canyons during the summer is growing at faster rates than winter. UDOT should consider this reality.

Consideration should also be given to the potential increased visitation from the south due to expected population growth. The CWC questions why a parking structure/staging area at 9400 South and Highland Drive was eliminated with respect to the aerial/bus alternatives. It is critical to consider population growth in the southern portion of Salt Lake County and Utah County.

Connections for visitors, residents, and workforce between Cottonwood Canyons and Summit County are also a critical consideration. The number of vehicles estimated coming from Summit County to LCC should not be easily dismissed as not having an impact on mobility, reliability, and safety. An opportunity to provide fast and convenient transit services between the economic and recreation nodes is crucial to improving the stated goals of the EIS.

The CWC thanks UDOT for the opportunity to not only provide comments, but to also serve as a cooperating agency. It is the hope of the CWC Board that these comments will be useful during the next phase of the EIS process. The steps taken thus far are helping move towards implementing transportation solutions desperately needed in the Central Wasatch Mountains. It is imperative that stakeholders, policy makers, land managers, and visitors to the Wasatch Mountains receive excellent information and fair evaluation to provide meaningful feedback on potential transportation solutions. The CWC greatly values and is thankful of the work done to date by the EIS team. We look forward to continued collaboration and cooperation during the LCC EIS process.

Sincerely,

Chris Robinson

Re: Comments on Little Cottonwood Canyon Draft Alternatives and Screening Process for the Little Cottonwood Canyon Environmental Impact Statement

To whomever this may concern,

The Utah Sierra Club was founded in 1969 by a group of individuals dedicated to protecting Utah's beautiful and unique natural landscapes and resources. Their legacy has persisted for over 50 years, evolving into a modern, inclusive grassroots environmental movement. This chapter has been integral in the fight to protect our wilderness, water, air, and public lands through landmark victories, including the first-ever protections for Little Cottonwood Canyon, which led to the passage of the Endangered American Wilderness Act.

Today, we lead efforts to transition from dirty fuels to clean energy, protect irreplaceable wildlands and habitats across Utah, act for justice, and bring a new generation of environmentalists into the outdoors. With over 40,000 members and supporters throughout the state, we lead efforts to advance climate solutions, protect land, air, water, and wildlife, act for justice, and get people outdoors.

We appreciate the opportunity to comment on the Utah Department of Transportation's (UDOT) Draft Alternatives and Screening Process for the Little Cottonwood Canyon (LCC) Environmental Impact Statement (EIS) published in accord with its obligations under the National Environmental Policy Act, 42 U.S.C 2500 et seq. Our overarching aim is to ensure that the pursued project and efforts made by UDOT meet the needs for the future of LCC and are forward-thinking, cost-effective, and protect the sensitive environmental resources -- air quality, water quality, habitat, and integrity of lands -- within the canyon and

its surrounding area. Given those objectives, we offer the following concerns and recommendations for consideration in moving forward with the LCC EIS process.

Purpose and Need Commentary

In our scoping comments, we suggested that an appropriate and representative purpose statement for an "Environmental Impact Statement" should prioritize protecting the environment. Including natural and scenic resources, with the highest priority given to air quality, water quality, supply, and watershed health. Considering this project's purpose should be to protect the environment and improve the canyon experience for residents, visitors, and businesses through improvements to our transportation and/or transit systems approaching or within the SR 210 corridor. The lack of such language results in a flawed strategy that we encourage you to correct.

Climate Change: A More Robust Analysis is Necessary

While the research suggests LCC's resilience amidst a changing climate, LCC does not exist in a vacuum. The climate analysis does not consider the potential changes in vehicle miles traveled (VMTs) as a result of other, lesser resilient ski areas along the Wasatch Front. We recommend that the climate analysis expand its scope to incorporate regional climate impacts that may place greater pressures on how the canyon is utilized.

For instance, a 2009 Climate Change report by Stratus Consulting summarized that Park City is extremely vulnerable to climate change and associated decreased snowpack. Their model estimated that "Thanksgiving snow depths are predicted to be at or near zero under all scenarios in 2050 at the base area."¹ Considering the change and potential decrease in skier days and skiable acres, the analysis does not address how such changes might travel in LCC. The current model considers only the snowpack change in the canyon and makes assumptions based on past snow accumulations and not potential regional projections.

Further, the analysis states that "...although annual precipitation amounts will remain unchanged or increase slightly (depending on the model and future scenario examined), the proportion of rain to snow will increase (Strong 2013; Scalzitti et al. 2016)."² Yet, there is no discussion about how an increase would require additional measures and transit considerations to protect mobility, safety (from disasters like landslides at the lower elevation), and the watershed.

Air Quality Evaluation Lacking in the Screening Process

Air quality along the Wasatch Front continues to fail to attain Environmental Protection Agency standards. With 48% of our emissions attributed to mobile source emissions—much of which comes from our

¹ See Stratus Consulting. 2009. "Climate Change in Park City: An Assessment of Climate, Snowpack, and Economic Impacts." Prepared for the Park City Foundation

² See Draft Alternatives Development and Screening Report. "Little Cottonwood Canyon Environmental Impact Statement S.R. 210 – Wasatch Boulevard to Alta". Utah Department of Transportation

passenger vehicles and light duty trucks—it is clear that Utah’s air quality problems cannot be solved with regulation alone and that meaningful and strategic transportation planning is critical to ensure progress.

While we anticipate a greater air quality analysis in the full Draft Environmental Impact Statement, not including air quality measures as part of the screening when LCC exists, areas of non-attainment is concerning.³ With population growth and VMT growth higher than the population growth rate, air quality will be significantly worse in serious inversions. New analysis is needed to plan a total system that reduces VMT in the air shed to a level that ensures the air is healthy to breathe and works toward meeting EPA National Ambient Air Quality Standards.

Alternatives Commentary

The three proposed alternatives do not meet the needs and purpose set out in the EIS, which are to improve mobility, safety, and reliability of auto use on SR 210 from Fort Union Avenue to the Alta Ski Resort. The three options suffer from 70% of travelers' use of personal vehicle traffic remaining on Wasatch Boulevard and the Little Cottonwood Canyon Road (LCCR) after significant investments in infrastructure. This is an insignificant reduction from the current 96% or so private vehicle use.

Therefore, these criteria primarily support automobile transportation planning, which conflicts with the Salt Lake County and Wasatch Front Regional Council (WFRC). Planning recommendations should apply to the highway and other transportation decisions. Among them are: provide transportation choices, preserve open space, and improve the air we breathe by reducing auto emissions. Also, reducing the use of travelers using private vehicles by only 30% does not support WFRC's primary goal of reducing VMTs.

We propose an alternative that emphasizes bus mass transportation by 2050. By this significant decrease in personal vehicle use, mobility and reliability will improve over the two proposed bus draft alternatives; And because buses are inherently safer than autos, more bus passengers can equate to greater safety.

In Summary:

- In 2050, 75% of people travelling up Little Cottonwood Canyon are on bus transit.
- In 10 years 25% will travel by bus, after 20 years 50%.
- The number of cars parking in the canyon will be limited to 1150 at any time.
- Tolling is used to incentivize mass transportation use.
- Promote Trax extensions to the two transportation hubs.
- Improve feeder bus service to the hubs across the valley.
- Express bus transit from FrontRunner and Trax stations to the hubs with priority over autos..
- Substantially decrease VMT

³ See Division of Air Quality 2019 Annual Report.

<https://documents.deq.utah.gov/air-quality/planning/air-quality-policy/DAQ-2020-001226.pdf>

- Subsidize transit ticket costs.
- Ensure trailhead bus service
- Improve air quality by reducing VMT
- Hubs are designed for primarily valley bus to mountain bus transfers.
- Eventually private vehicle parking at hubs will also be limited.
- The north hub can be used to convert transportation up Big Cottonwood Canyon to bus mass transportation.
- The Alta Canyon road does not need to be widened.
- Wasatch Boulevard will require significantly less widening.
- Welcoming hubs and bus terminals at the ski resorts.

I. Bus Traffic Can Safely Handle the People Per Hour Rate Requirement

The special buses used for canyon travel are limited to 42 people. Regular buses cannot be used for canyon transportation, which means a feeder system using regular buses across the valley requires transportation hubs to move people to the special buses. Peak usage is estimated at 3257 people per hour for both bus alternatives. The 75% use of buses will require 60 buses per hour: 36 per hour from the north hub and 24 per hour from the south hub. For the traffic on Wasatch Boulevard south this means a bus every 100 seconds. 90 buses are estimated to be needed for this service. In addition, bus passengers are 10 times safer than auto passengers. Additional traffic lanes are not needed for the LCCR. The substantial reduction in overall vehicle use means the current roadway will be adequate.

Avalanche sheds will be necessary for public safety, mobility, and reliability.

II. The Substantial Reduction in Personal Vehicles Traveling Up-canyon Will Require Enhanced Valley Feeder Busses

Vehicle traffic should be minimized to the traffic hub as well as on Wasatch Boulevard. This can be done incrementally by adding local feeder bus service to the valley and express buses to Trax and Frontrunner stations. The personal vehicle reduction should be 25% in the first ten years, 50% reduction by 20 years and 75% reduction by 2050. As tolling reduces personal vehicle flow up the canyon, parking fees at the hub can incrementally increase to incentivize drivers to take the bus. Transit fare subsidies will help this transition.

Additionally, limiting parking capacity in the canyon to 1000 vehicles, with exceptions for landowners, service, and safety vehicles, can serve to incentivize bus use. With exceptions considered, it may be necessary to implement measures that require drivers to reserve a parking space before entering the canyon -- on a given day. The 75% reduction in people per hour at peak times in private vehicles results in 814 people per hour versus 2249 people per hour in private vehicles for the proposed 30% reduction. Valley floor parking will happen in smaller local lots associated with the feeder bus system routes. This substantial reduction in private vehicle use will

reduce the need to expand Wasatch Boulevard in Cottonwood Heights. The 2050 UTA transit map depicts a light rail line from South Jordan FrontRunner and Trax station to and up Little Cottonwood Canyon. Instead, two lines need to connect to the two hubs. The replacement of personal vehicle traffic by mass transportation will also reduce VMT and improve air quality.

III. Enhanced Bus Service Means Trailheads Can Be Serviced

Several busses an hour can be dedicated to servicing trailheads as well as the resorts. No additional parking spaces will be needed and the trailhead parking lots will be modified for convenient bus ingress and egress as well as rest facilities and trash receptacles.

IV. The North Traffic Hub Can Eventually Be Used for Big Cottonwood Canyon Traffic

The north traffic hub will be designed for the number of parking spaces called for in the two bus alternatives. Over time, with parking fees, tolling in Little Cottonwood canyon, and increase in bus capability across the valley it can be used to convert Big Cottonwood Canyon traffic to mass transportation. The hub will have to be designed so it can eventually be used for bus to bus transfer by 2050.

V. Skiers Need Welcoming And Well Thought Out Terminals

The transportation hubs in the valley have to be convenient and easy to use. Instead of commuter traffic, passengers will have ski equipment and clothing. They will have small children. At the terminals at the ski areas passengers should be welcomed to a warm environment. They will need lockers, rest rooms, places to eat lunches that they brought. These terminals can be placed in the existing parking lots since car spaces will be greatly reduced. There are currently 4600 designated parking spaces in and around the ski areas. A 75% reduction means only 1150 are needed.

Conclusion

We are grateful for the opportunity to comment on the Draft Alternatives for the Little Cottonwood Canyon Environmental Impact Statement. Please don't hesitate to reach out with any question about our comments or to discuss any matters we've raised.

Sincerely,
Will McCarvill,

Chair, Executive Committee, Utah Sierra Club

Re: Comments for the Little Cottonwood Canyon EIS Draft Alternatives Development and Screening Report, dated June 8, 2020

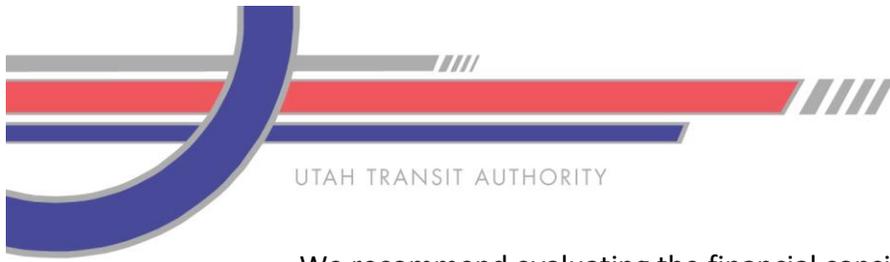

Dear Mr. Van Jura:

Thank you for the work that UDOT has already done to address the complex issues facing Little Cottonwood Canyon. As a cooperating agency, UTA appreciates the opportunity to comment on the alternatives being proposed under the Little Cottonwood Canyon Environmental Impact Statement (EIS). Our comments are intended to highlight many of the operational considerations that must be addressed to operate transit service within the corridor in a safe, effective, and financially feasible manner.

Key considerations UTA suggests being evaluated in the Report include:

- Life-cycle cost. For a more comprehensive evaluation of long-term public investment, we recommend that life-cycle cost analysis to include operations, maintenance, and state of good repair requirements be considered in the comparison of alternatives.
- Reliability of transit. The reliability of transit service is the key to meeting the mobility objective of the project. This is especially important when use of the canyon increases during bad winter conditions. We recommend more robust infrastructure to support the safety, connectivity, and reliability of public transit.
- Continue considering a reasonable range of alternatives. UTA supports transportation solutions that are consistent with the regional planning set forth in the RTP and believes the rail alternative should be further evaluated. In addition, an alternative that includes both transit hubs should be considered. With this in mind, UTA understands the importance of continued coordination with WFRC.
- Operational and maintenance considerations. Providing a large experienced workforce to support an expanded seasonal transit service can be challenging.

UTAH TRANSIT AUTHORITY

669 West 200 South

Salt Lake City, UT 84101

We recommend evaluating the financial considerations necessary to sustain that workforce. In addition, maintenance facilities and costs should be appropriately considered, including for a rail option. Existing rail maintenance facilities could accommodate a canyon rail system with a smaller supplemental facility.

UTA appreciates the opportunity to collaborate as a cooperating agency with UDOT and its other partner agencies on the preparation of the technical analyses and evaluation set forth in the draft report. UTA provides integrated mobility solutions to service life's connections, improve public health, and enhance quality of life. The key considerations summarized from UTA's detailed, technical comments (attached) are prepared in consideration of this agency's mission. This is a complex transportation corridor for which several innovative solutions are being evaluated. As such, important considerations have been identified, which UTA believes can be addressed through our continued collaborative approach specific to this corridor that also could advance a systems approach to a regional transportation network. UTA commends UDOT for its leadership in undertaking this study of improving transportation in the corridor.

Enclosed are our comments, none of which are intended to promote or discount any alternative—more analysis awaits during the process to allow for comprehensive and informed decision-making. If you have any questions regarding these comments, please contact Autumn Hu, NEPA Project Administrator at 801-741-8858 or ahu@rideuta.com.

We look forward to continuing to work with UDOT on transit solutions for the transportation issues in the canyon.

Sincerely,

Manjeet Ranu

Manjeet Ranu, AICP
Director of Capital Projects

**UTA Comments for
Little Cottonwood Canyon Environmental Impact Statement
Draft Alternatives Development and Screening Report, dated June 8, 2020**

July 10, 2020

Enhanced Bus with Road Widening

1. **Shoulder Lane** – In the proposed Enhanced Bus alternative, the buses will operate in the shoulder during peak periods on Wasatch Blvd to take advantage of the transit signal priority, and also in the shoulder all the way to Alta. The 10-foot shoulder lane is not wide enough for a bus to safely operate. Our ski buses are approximately 10.5 feet wide (including side mirrors) and would need a minimum 12-foot wide lane to safely operate. Also, snow tends to accumulate on the shoulder from plowing which makes the shoulder unusable over time. It would improve safety and reliability to widen the shoulders beyond 12 feet.
2. **Reversible Lane** – It appears that the reversible median lane was considered for general traffic conditions, but a reversible bus-only lane was not specifically considered. Safety requirements for a reversible bus lane may be different from the requirements for a reversible general traffic lane since users of the lane would get specific training. The dedicated bus lane could be in the median or to one side of the road. A system, such as barriers, would prevent general traffic from merging into the bus lane. Having a dedicated, barrier-protected, bus lane would allow the buses to move faster than cars though Little Cottonwood Canyon during peak periods and provide dedicated summertime bicycle facility.
3. **Dedicated Lane on Urban Roads** – A main reason for delay in ski bus service is the congestion experienced on Wasatch Blvd and 9400 South when traveling to get to the mouth of Little Cottonwood Canyon. Transit signal priority is most effective if buses are traveling in a dedicated lane. Considering the amount of bus traffic being proposed from each mobility hub (i.e. average 5-minute headway for the enhanced bus alternatives), and buses traveling in both directions, there could potentially be a bus at an intersection about every one or two minutes. While the alternative is designed for buses to travel with free-flowing vehicles, that is unlikely to happen on busy days and bad weather conditions. To better realize the goals of the transit service, it would be preferred for buses to operate in a median dedicated lane instead of on the shoulder where they would be slowed down by right turning vehicles. This condition should be in place from each hub.
4. **Turning Lane** – For high frequency bus service, it is important to have turning lanes long enough so that vehicles and buses wanting to make the turn do not block the buses that need to go straight. For example, there could potentially be multiple buses in the turning lane at the mouth of LCC.

Bus Maintenance Facility

5. **Bus Maintenance Facility** – For the enhanced bus service, potential locations that can accommodate the maintenance and storage facility should be identified as part of this study. A location near the mouth of the canyons would be preferred to decrease time and resources required to deploy the buses.

Gondola

6. **Decrease in Ridership** - Without the 9400 S mobility hub, skiers coming from the southeast may drive rather than take transit. This reduced potential in transit ridership would correspondingly increase vehicle traffic in the canyon and should be considered in traffic modeling, including travel speed and travel time in the canyon for the 70%+ people expected to be driving.
7. **Two Transit Hubs** – The alternatives with only one transit hub were evaluated. The EIS should also evaluate an alternative that includes both transit hubs, one at the gravel pit area and one at the 9400 S Highland Dr. park-and-ride lot. This could allow a reduced size of parking garage at the Gravel Pit Hub and continue to attract passengers from the southeast.
8. **Transit Incentive** – The inconvenience of using three modes of transportation for a trip (car-bus-gondola) could be unappealing when the alternative is a single mode trip in one’s personal vehicle; unless, disincentives are placed on private vehicles travelling up the canyons or stronger transit incentives are provided.
9. **Bus Type** - Larger 60-ft articulated buses are not recommended because they do not handle well in snowy conditions. To get 1050 riders/hr to the gondola base, twenty-five 40-ft buses (42 riders per bus) per hour would be required which translates to a 2.4-minute headway from the gravel pit. The dedicated bus fleet would depend on the estimated bus cycle travel time from the transit hub to the gondola base and should include the standard 20% spare ratio. The bus cycle time to determine the bus fleet should include dwell time and layover time.
10. **Limitation of Bus Service** – The capacity of the gondola is much higher than bus, so the combined system (gondola and bus) will be limited by the capacity and reliability of the bus service. It is unlikely that the bus capacity will be able to match that of the gondola capacity and demand, especially during canyon road closures when more people switch mode to transit. Buses could be operated in platoons to increase capacity if a larger bus fleet is planned.
11. **Dedicated Bus Lane** – For the gondola alternative, a dedicated bus lane between the transit hub and the gondola base is recommended. To get 1050 people/hr to the gondola base, a 2.4-minute headway would be required. UTA currently operates the UVX line in Provo and Orem at a 6-minute headway, the highest frequency in our system, in a corridor with some dedicated lanes. Bus signal priority on Wasatch Blvd. may not be sufficient to operate this high-frequency bus service reliably during peak periods. Adding a dedicated transit lane from the transit hub to

the gondola base would improve reliability of the bus service. Buses could be operated in platoons in the dedicated lane to increase capacity.

Rail

- 12. Rail Alternatives** – The existing rail alternative should be further evaluated. Rail is a mode that can provide the capacity and reliability to meet the transit needs for the canyon. In addition, it can provide a direct connection to our local and regional transit system, taking a systems approach; thereby reducing vehicle congestion in and around the project area. To reduce the environmental footprint and costs, portions of the rail alignment could be designed with single-tracks. UTA currently uses light rail vehicles that are outfitted with two power trucks each. Light rail manufacturers produce similar vehicles that utilize three power trucks that could potentially provide the adhesion force required for the steep slope in this canyon. This type of light rail system should be reviewed as a distinct alternative to cog rail, or a variation on the cog rail alternative. The capital cost of rail is initially high, but the long-term operational costs may be lower than bus. A life-cycle analysis should be evaluated to provide a more equivalent comparison with other alternatives. Moreover, the ability to more effectively integrate with the existing and planned regional transit system may demonstrate greater efficacy to a rail alternative than is currently evident. Further analysis would help support future decision-making on this potential, major investment.

UTA is currently working on the Future of Light Rail Study to determine a regional travel fleet strategy to help UTA prioritize our resources. The fleet strategy may include change in vehicle type and modification to maintenance facilities. The canyon rail system would have to be accommodated without impact to the long-term strategy. Please also see equity concern under comment 17.

- 13. Maintenance Facility** – UTA’s existing light rail maintenance facilities can be used to service a canyon rail system but may require an additional minor repair maintenance facility to free up capacity at the Midvale and the Jordan River rail service centers. If a rail alternative will be further evaluated, UTA will coordinate with UDOT to refine details and estimate costs.

Transit Hub

- 14. Capacity of Road Network** – The location of the transit hub should consider the capacity of the road network to handle all the traffic that the hub will generate, in addition to other uses in the development. The roadway capacity should be evaluated to determine if the road network could deliver people in their cars to the parking lot at the same rate as the bus service, keeping in mind that some of the capacity would be needed for non-canyon or non-transit users or for people using bus service other than that going to BCC or LCC. It could be that the site roadway infrastructure becomes the new bottleneck, generating new congestion on the streets leading to and away from the mobility hub, and not be able to deliver the number of cars/people that

we are forecasting for the bus service. Similarly, dedicated bus only lanes would assist in efficient bus movement into/out of the hub.

15. **Parking Structure** – Parking areas for transit riders should be designed to accommodate additional people using transit during canyon closure days under the gondola option, and other local bus routes that use the hub as a park and ride lot for non-canyon travel.

Cost of Alternatives

16. **Long-term Costs** – The long-term costs to maintain the service should be clarified. The O&M costs are required annually to sustain the service. In addition, different modes would have different equipment replacement cycle which would require additional capital investment. UTA buses generally need to be replaced every 14 years and there is a required mid-life overhaul to replace the engine and transmission which currently costs about \$50,000 per bus. Including these costs with annual operation and maintenance costs in a life-cycle analysis would be helpful in comparing alternatives for long-term investments.

Operation

17. **Workforce** – For UTA to operate a seasonal enhanced bus service, it would be comparatively more expensive than regular bus service due to our union contract requirements. It would be more economical as a year-round service. UTA's union contract requires guaranteed minimum hours for bus operators. To provide our current ski-bus service to LCC and BCC, UTA's Salt Lake Business Unit overstaffs by 25 operators in the off-season (April to December). These ski-bus operators are integrated to the overall bus operator network to accommodate operators needing time off for training, those choosing to take summer vacations, and natural attrition. For the proposed enhanced bus service for LCC (a 4 route system, each with 10 minute service), we estimate that it may require more than 100 operators, and a seasonal labor force this large would be difficult to integrate into the overall bus operations during the off-season. With seasonal service, the labor costs would need to be adjusted to keep the operators on staff year-round and to include training new operators due to natural attrition. UTA will coordinate with UDOT to estimate these costs.
18. **Operating Funding Source** – Operation of different alternatives would potentially be funded differently, due to the operating characteristics. UTA would need a dedicated funding source for the enhanced bus service in the canyon. As a public transit agency, UTA considers equity and the distribution of our resources across our service area. UTA must balance how it allocates its operating budget to serve the communities within our service area based on demand and need. Importantly, UTA is bound by Civil Rights Act Title VI as a recipient of federal funds.

Report

19. Table 2-1, Five-Lane Alternative – Please add description of what is included north of Bengal Blvd.
20. Table 2-7, Impacts to Natural Environment – Road widths being compared are 95 ft vs. 107 ft, a 12-ft difference, so why is area of impact the same? Please include an explanation in the discussion.
21. Table 2-8, Bus-only Alternative – only buses allowed in Little Cottonwood Canyon – Who are the nonresidents who are allowed vehicle access? Please provide clarification.
22. Table 2-8 - Aerial Transit from the Salt Lake Valley Alternative – Please clarify that an aerial system that does not include parking at the base would require bus service from a transit hub to the base of the aerial system.
23. Figure 2-8 – Suggest including street names.
24. Table 2-9 – Suggest changing heading to: Cost of alternative (in 2019 dollars) to be consistent with previous table.
25. P-42, Section 2.2.2.1, Bus-only Alternatives, first paragraph – Suggest changing text to: “This would equal about 75 buses per hour using a bus type similar to UTA’s current buses, which have a standing capacity of about 42 people.” We don't want anyone to misunderstand that UTA already has a ski-bus fleet to run 75 buses/hr.
26. P-43, Regional Shuttle Bus System Alternative, paragraph 1 - Please clarify that regional shuttle system with direct service to the resorts is screened out due to the cost of operating this large shuttle network. Operating such a network typically involves a tradeoff where breadth of coverage generally reduces frequency within that coverage, due to cost. In addition, this system would bring more vehicles into LCC as compared to a feeder system which would use buses, with higher capacity than shuttles, in LCC.
27. P-43, Regional Shuttle Bus System Alternative, paragraph 3 – Please clarify that the travel time discussion is regarding the bus/shuttle not the rider, since travel time for the rider would increase due to transfer. Suggest changing text to: “Transit service from a mobility hub near Little Cottonwood Canyon to the ski resorts would reduce the distance of travel for bus/shuttle as compared to a regional bus route starting near Salt Lake City, for example. Such transit service would therefore reduce the travel time for the bus, which would result in a more reliable service.”
28. P-43, Regional Shuttle Bus System Alternative, paragraph 3, last sentence – Suggest changing text to: “For analysis in the EIS, it was assumed that a regional shuttle bus system was assumed to provide the same service levels as the operating as a transit feeder network will complement the Enhanced Bus Service Alternative, but does not provide service to the final destinations, so it is not evaluated in the EIS as a separate alternative.”

29. Table 2-12, Alternative 3B – Please consider the capacity of buses to provide transport from the gravel pit to the gondola base at the mouth of LLC during peak times. Headway will be closer to 2.5 min and additional roadway improvements may be required to improve reliability of bus service.
30. P- 56, Cog Rail Alternatives Comparison, paragraph 5 – Wrong alternative referenced; suggest changing text to: “With Cog Rail ~~Alternative 2~~ Alternative 3, personal vehicles would travel past more residential areas to access the parking structure at the 9400 South and Highland Drive mobility hub.”
31. Table 2-15 Natural Environment – Alternative A4 does have impacts to the natural environment. The text in table for Alternative A4 should be “Not Evaluated” instead of “Not Applicable”.
32. Table 2-15 Cost of alternative - Showing two reference years in the row heading is confusing. Suggest changing heading to “Cost of alternative (in 2019 dollars)” to be consistent with previous tables.
33. Table 2-17, Tree Farm off Wasatch Blvd – Spelling error: “The lot includes steep ~~train~~ terrain that may make construction difficult.”
34. Table 2-18, Total People in the Peak Hour – First number should use comma instead of period to represent a thousand.
35. P 67 – Please check the projected number of people that will enter LCC in 2050 and use that number consistently. The document refers to 3,200, 3,250 and 3,260.
36. P 68 paragraph 5, last sentence – Since the intersections at 9400 S/Wasatch Blvd and Wasatch Blvd/North Little Cottonwood Rd are used as criteria to screening alternatives-based vehicle backup, they should be added to Figure 2-14.
37. Table 2-21, Meet Peak-Hour Person Demand – Second number should use comma instead of period to represent a thousand.
38. Table 2-21, Substantially Reduce Vehicle Backups at S.R. 209/S.R. 210 Intersection – Should include the unit in the heading (feet).
39. Table 2-22 and Table 2-23 – The costs shown in Table 2-23 include snow sheds. Need to clarify in text and/or in Table 2-22 which alternatives include snow sheds.
40. Table 2-23 Gondola Alternative – This alternative includes the road improvements on Wasatch Blvd, therefore should include the impacts shown in Table 2-7, in particular the wetland and floodplain impacts should be equal to or greater than 0.65 acre and 3.74 acres, respectively.
41. Table 2-23, Cost of alternative – Reference year in row heading (2020) is inconsistent with footer (2019). Recommend removing reference year in footer and change heading to: “Cost of alternative (in 2019 dollars)” to be consistent with previous tables.
42. Table 2-13, footer d – This is the first time snow shed is mentioned. The text in the discussion should clarify that bus and cog rail alternatives would require snow sheds.

43. Table 3-5, Cost of alternative – Showing 2 reference years in heading is confusing. Recommend changing heading format to: “Cost of alternative (in 2019 dollars)” to be consistent with previous tables. Is cost based on 2020 or 2019?
44. Table 3-10 Cost of alternative – Showing 2 reference years in heading is confusing. Recommend changing heading to: “Cost of alternative (in 2019 dollars)” to be consistent with previous tables.

Appendix D – Enhanced Bus Concept

45. TOC – List of tables is not sequential
46. Page 1, last paragraph, first sentence – Suggest deleting the word “be”, changing to: “Summer transit is not considered in this report.”
47. Table 3 – The cost per revenue hour of \$112.63 is the cost from the NTD UTA 2018 Report. This cost should be changed to \$116.01, the 2019 cost and the value used for calculation in the appendix.
48. Page 14-16 – Table is continuous from previous page and should be Table 4 (not Table 5).
49. Table 4 and fleet calculation in appendix – Due to the extended time required to load and unload a bus full of passengers with ski gear at the transit hub and at the resort, the dwell time at these stations can be a significant part of the bus cycle and important in determining the number of buses required to provide the service. A 10-minute dwell time should be added to determine the bus fleet required and the associated capital costs. Since the dwell time can be about 10% of the bus cycle, this can increase the capital costs for buses and maintenance facility by about 10%.

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121

The Cottonwood Canyons are one of the best assets along the Wasatch Front that contribute to our quality of life. In order to protect this treasured area, both environmentally and recreationally, we must plan for its future use in a sustainable way. The best generational choice to accomplish this is through the development of a gondola up Little Cottonwood Canyon.

A long-term transportation solution to move people up and down the canyon cannot rely solely on road options. More bus service is a short-sighted way to put a band-aid on a worsening wound. Widening the road for a dedicated bus lane doesn't address dangerous road conditions that close the road all too often in the winter. Building snow sheds only protects so much of the road from avalanches and require extensive earthwork to build a concrete tunnel eyesore. The bus ride experience itself is certainly not ideal with standing room only, snow gear in arms, and a winding road.

The gondola is a safer, faster, and more reliable transportation system regardless of canyon weather conditions. When a car accident, avalanche, or other natural disaster closes the only road in and out of the canyon, a gondola remains open as a secondary access point. Compared to the carbon-based alternatives, the gondola is the most environmentally-friendly for the air and watershed. Instead of increasing the vehicle count in the canyon, the gondola removes cars and buses from the road by putting people in the air. A gondola's lifespan is three times the life span of a bus. The gondola is also the only option that has the opportunity to share capital and maintenance costs through public-private partnerships. It enhances the canyon experience with a new activity that everyone, including the disabled, can enjoy.

Now, with the option of moving the gondola base station away from the mouth of the canyon to the La Caille station model, even more concerns are taken care of. The La Caille location realigns the gondola route to stay out of protected forest areas. Drop off, bus turnaround, and parking traffic is moved to an area that has enough space to handle it. Additional parking at the site also enhances planned mobility hub parking options which is pivotal to long-term planning.

Solving transportation issues while also preserving the value of Little Cottonwood Canyon has been a puzzle we've been looking at for decades. With the Gondola plus La Caille Base Station, we now have all the pieces to make the most progressive regional transportation system for the canyon in the most sustainable and efficient way possible. Please include the gondola plus La Caille model to study further as a forward-looking solution for the canyon.

Sincerely,

Derek Miller

Save Our Canyons' Little Cottonwood Canyon EIS - Alternatives Comments

To whom it may concern;

Save Our Canyons is a member driven non-profit organization based in Salt Lake. We are responding to UDOT's invitation to submit comments on the present alternatives-identification phase of the Little Cottonwood Canyon (LCC) EIS, published in accord with its obligations under the National Environmental Policy Act, 42 U.S.C 2500 et seq. While we recognize that the present NEPA process has advanced to the identification of specific potential alternative transportation improvements for LCC, unavoidably, some of our comments regarding the specific alternatives relate to a fundamental defect in the process that has led to the proposal of the present set of alternatives.

For nearly 50 years, we've worked to protect the wildness and beauty of the Wasatch. Our members and the communities we represent are not only frequent visitors to the Wasatch, we have land owners, businesses, scientists, engineers, students and consultants and lawyers in our ranks. Our members and their health and livelihoods, rely on the water that comes from these canyons. We have been patrons of resorts in the area, but also have regard for the ecology and are advocating for a more sustainable future in the Wasatch. As proposed, UDOT's alternatives directly threaten the Wasatch, our water supply, equitable access, and lay a foundation for further economic exploitation of this vital natural resource. We provide these comments in hope that UDOT will drastically alter its course of the EIS, who's purpose, screening criteria and now alternatives fail the Wasatch, and the community of life which it supports.

So that these comments can be better understood, we will begin by describing what the aforementioned defect is.

Need for comprehensive regional planning

Salt Lake City, together with the many contiguous Wasatch Front communities, has become a large metropolitan area, and it is very quickly becoming a much larger one. Anyone who has traveled to a number of large cities recognizes that one thing shared by those that people most enjoying visiting and living in is an appealing, efficient, and integrated transportation system. The process UDOT is conducting for LCC is not part of the planning of such a system. It is a fragment, disconnected from existing polices, strategies, and broader plans. It is another example of a haphazard pattern of one-off, shortsighted, narrowly focused transportation fixes to recurring localized urgencies—urgencies that occur largely because of the lack of a broader plan, or worse, failure to act upon plans that have been tirelessly worked upon by local communities and

governments (Mountain Accord, Salt Lake County Canyons Transportation Plan, Salt Lake City Watershed Plan, USFS 2003 revised plan, Salt Lake County Canyons General Plan, 1989 Wasatch Canyons Master Plan, etc). The problems with Wasatch Front transportation, especially for the canyons, are interrelated; any plan that is not a comprehensive response to the needs identified through a thorough understanding of these interrelationships is doomed to be largely wasteful and ineffective. That is, wasteful to the taxpayer and ineffective as a transportation system.

While we acknowledge the existence of Regional Transportation Plan which is continually updated by Wasatch Front Regional Council, the specific resource management plans that acutely deal with this unique landscape (like those mentioned in the paragraph above), have not been incorporated into the RTP, which operates at a much coarser scale than the other numerous plans that consider the fate of these canyons. Furthermore, these RTP anticipates the accommodation of growth, ignoring the importance of these watershed canyons. The focal point of this EIS is not an area planned to accommodate additional significant residential or commercial growth. To the contrary, numerous plans, ordinances and strategies point to the objective of significantly curtailing residential and commercial growth and development in order to meet the paramount legal obligations of providing, first and foremost, high quality, low cost, drinking water to the population, and two, to protect and preserve the high quality recreational opportunities that exist throughout these canyons. This process doesn't just ignore these priorities, the agency has outright rejected consideration of these, with prejudice toward increased tourism and economic development goals.

It cannot be overstated how critical the protection of the canyons of the Wasatch Front are to our regional quality of life, economy, and public health. Preserving the character of these canyons to maintain quality of life is another necessary dimension of comprehensive transportation planning. The goal of such planning should not be to efficiently pack as many people as possible into the canyons; it must also recognize that, at the same time people need access to the canyons for quality of life, it is an overabundance of people, and the development they bring and attract, that, left unchecked, will degrade the experience of being in these canyons. Transportation planning therefore must include a determination of the scope and intensity of human uses that can occur in the canyons without substantially harming their character and diminishing their contribution to a high quality of life, affordable pure drinking quality water, or other economically oriented ecosystem services. The alternative to such planning is the path we are on — a path toward an eventual equilibrium in which the impetus to continue improving access into the canyons levels off because the canyons have become places that are less attractive to people. Understanding what level of human use LCC can bear (call it carrying capacity, visitor analysis, or other) should have been a starting point for this project. Without this understanding, UDOT is blindly advancing the canyon toward achievement of this tragic equilibrium.

Amenity Migration

One of the drivers of issues in the region is amenity migration. Amenity migration is most simply defined as growth or relocation of people (seasonally or permanently) driven by the desire to nearer an amenity. In our case locally, this amenity is Utah's iconic public lands, and specifically to this project, the amenity is the Wasatch Mountains. While, it appears that UDOT believes the amenity of note is skiing, particularly resort skiing, as that is what it has erroneously focused its

Figure 7a: Central Wasatch Recreation Activity Overview: Number of Respondents and Frequency of Visitation (N = 318)

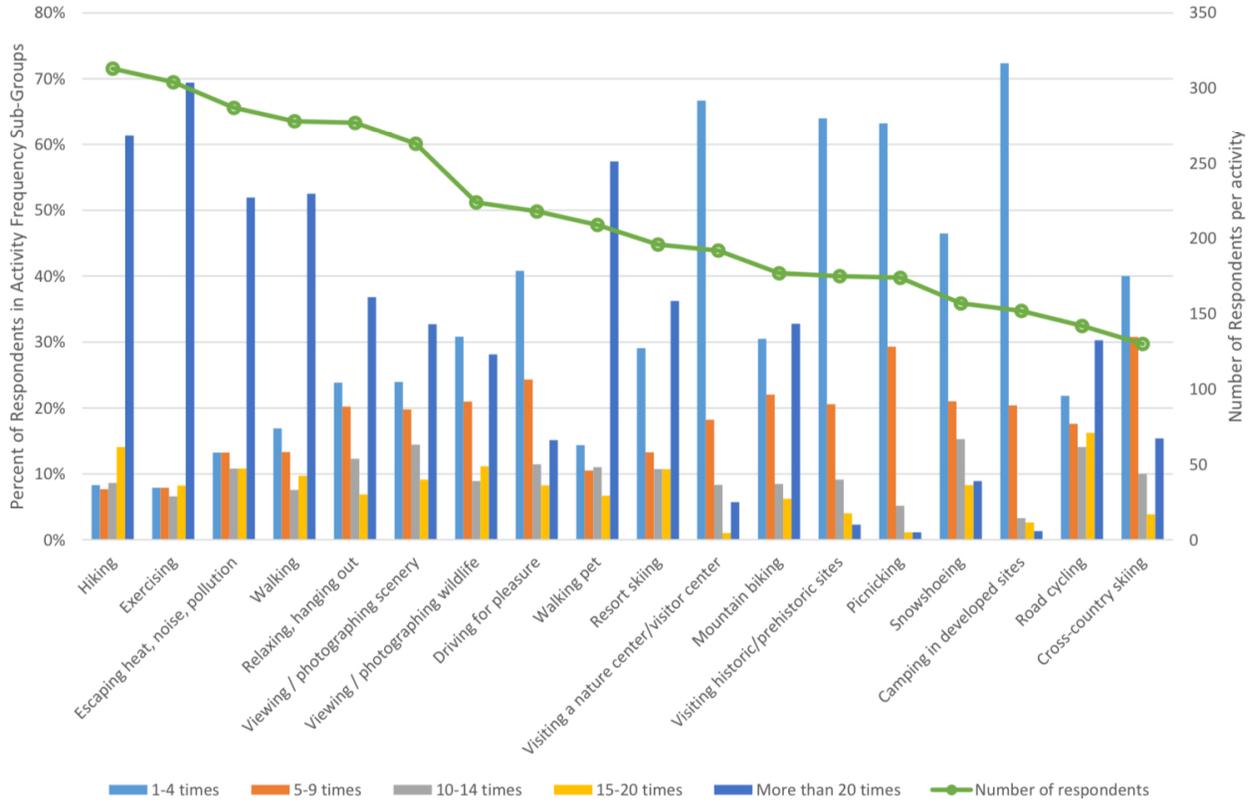

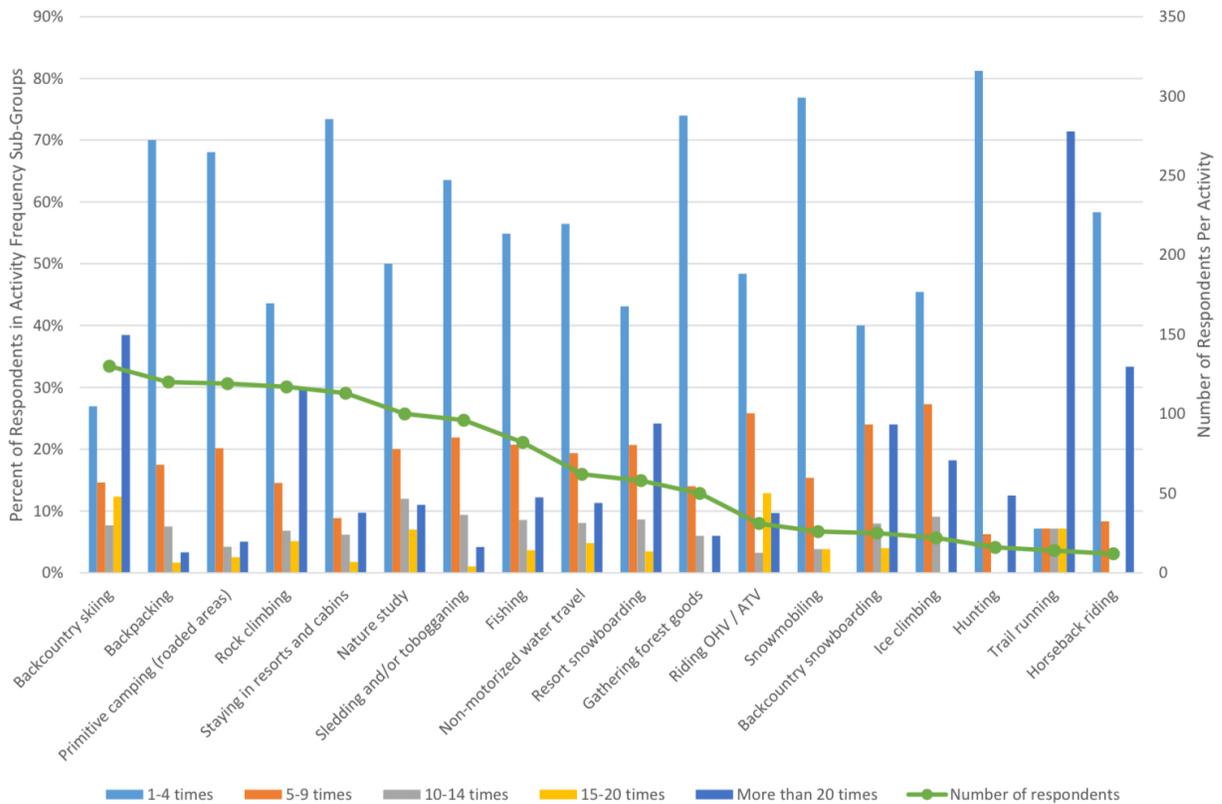

Figure 7b: Central Wasatch Recreation Activity Overview: Number of Respondents and Frequency of Visitation (N = 318)

EIS on. However, comprehensive analysis done on the region suggest that 70% of visitation to these environments are to dispersed recreation sites.

The above charts, taken from a 2015 Utah State recreation survey of the Central Wasatch (Burr, Lamborn), help to give a sample of the amenities visitors to the region are seeking. More comprehensive and seasonal analysis can be found in the quarterly reports on the project site: <https://extension.usu.edu/iort/research/cw-visitor-use-study>

Amenity migration is one of several factors compounding issues in our canyons. That said, how we grow, and how we move people around - *to* and *within* these canyons - is of critical importance as these environments are geographically restricted, have critical ecosystem functionality, and cannot accommodate infinite growth, and certainly cannot accommodate more cars. This is reenforced in numerous plans by the USFS, Salt Lake County and Salt Lake City, where they have all called for no more parking in these canyons, as strategy UDOT has been derelict in curtailing by failing to enforce road side parking prohibitions.

Providing transit service, accompanied by visitor management strategies to adhere to capacities, is one way to ensure we better accommodate visitation and usage, but not allowing those visitors to use a car (or at very least not a car with empty seats in conjunction with improved transit) to get to destinations could reduce the impact wild lands in the Wasatch.

We are not suggesting you stop amenity migration, rather do more to understand your role in managing, partnering with others who are responsible for managing visitation, and understanding the impact this trend has on the amenity of relevance: the Wasatch Mountains and their critical watersheds.

Economic Development and “Purpose and Need”

For over 30 years, local communities have demanded improved mass transit into our canyons, yielding a car-less experience in these vital watershed canyons. Removing cars improves both the natural and human environments, by ensuring more natural areas aren't converted into places that need to host cars (ie. Parking lots), thereby degrading water quality. While the air quality impacts of private vehicles are secondary or even a tertiary benefit of reducing car, reducing vehicle miles traveled in the region, given our non-attainment status as identified by the EPA, would certainly be a benefit. These sentiments have been captured most recently, in comments to this very EIS, by the Central Wasatch Commission who's board represents jurisdictions that are impacted by decisions in this EIS, in the Mountain Accord and its supporting documents, as well as in numerous land and resource management plans. Not one of those plans has called for accommodation of more visitation and vehicular traffic - which is an outcome of this process. In fact, many of these plans have called for innovative strategies to aid in the significant reduction of vehicles, parking, infrastructure in these areas. While this project states it will help UDOT meet its goals for SR 210 (which we question whether it actually will), it comes at great expense to legal obligations of other land and water managers, alienates non-resort users from benefitting from transit access, and acutely threatens the wild and scenic attributes of an iconic a glacially carved canyon for the benefit of private resorts. While the benefits of these alternatives are significantly lacking, one thing is clear, stewardship and management of these canyons is not a value UDOT holds for the region. Further, they show little if any care for the obligations, goals

and resources of other governments. The values driving this process are economic development as stated in the legislation that authorized funding for this process.

There has been much concern about the underlying purpose of this project being solely for economic development. When the process started, it was attempting to look at the canyon and as the Alternatives Report clearly states, the purpose is to “substantially improve transportation related safety, reliability, and mobility on SR 210 from Fort Union Blvd through the Town of Alta, for all users on SR 210.” The Wasatch has four-seasons of many different uses, and to benefit all users on SR 210, which is the main access point for all users, UDOT must look at all seasons. However, as the process has progressed, UDOT has arbitrarily winnowed the broader and connected scopes to look only at winter months, and more, only looking at the top of the canyon, alienating “all users” in deference to economic development opportunities for two businesses in the canyons, notably, Snowbird and Alta ski areas.

In 2017, the Utah Legislature passed SB 277, which was eventually signed by Gov. Herbert. This bill stated,

“... proceeds from the issuance of bonds shall be provided to the Department of Transportation to pay all or part of the costs of the following state highway construction or reconstruction projects:

(b) \$100,000,000 to be used by the Department of Transportation for transportation improvements as prioritized by the Transportation Commission for projects that:

- (i) have a **significant economic development impact** associated with recreation and tourism within the state; and
- (ii) address significant needs for congestion mitigation.”

While, prioritizing only one area of the economic contributions to the area, being resort-based visitation and recreation, UDOT has completely ignored several other economic factors. If you are going to incorporate economic indicators in your decision making process, you should not pick and choose, rather be comprehensive in your analysis. Most notably excluded, quality of life considerations for the many uses in the Wasatch Mountains, impacts to water quality via induced visitation that will be passed on to downstream users to clean up, and the impacts to non-resort based recreation that comprises the majority of visitation to these areas. Not only is UDOT ignoring these impacts, they go a step further and advocate for inducing demand being a benefit of one alternative.

At a June 16, 2020 meeting with our organization and UDOT representatives, it was reported that “one benefit of the gondola would be that it could serve as a tourist attraction and generate additional revenue.” This was again stated at the public meeting hosted by UDOT at approximately 7:18pm on June 23, 2020. It is highly inappropriate for the agency tasked with objective analysis pursuant to the National Environmental Policy Act (NEPA) to advocate for benefits unrelated to its chosen purpose and need. It is unrelated to the purpose and need, unrelated to the selected screening criteria, and demonstrates that UDOT is not an objective arbiter in the NEPA process for which it has been granted authority to conduct on behalf of the broader public.

Several sites of importance to our water drinking and recreating communities will be immediately and negatively impacted by these alternatives and their associated infrastructure.

Recreation spending on backcountry skiing, hunting and fishing, climbing/bouldering, hiking, mountaineering and other nature based activities are not only, not a consideration, but will be displaced. Further, every alternative forwarded to date, will result in the condemnation of property, and not for public benefit, but for the benefit of two private resorts.

As mentioned earlier, in 2015, Save Our Canyons in partnership with the USFS, Salt Lake City and Utah State University conducted a survey of visitors to the Wasatch Mountains. In it we found that about 70% of visits are to dispersed sites (trailheads, crags, boulders, backcountry ski areas, picnicking, non-resort recreation), while only 30% are to the resorts. Local spending was estimated to generate \$385.87 Million locally. Gear based spending for individuals in the area is between \$600 and \$1,500 annually. Displacement of the activities by the alternatives could significantly affect this spending, damaging our local economy.

You can find a comprehensive list of the six relevant reports on the USU website: <https://extension.usu.edu/iort/research/cw-visitor-use-study>. We believe your project could glean critical information, not only pertaining to the economic importance, which is clearly of the state's highest consideration and primary interest, but to the values, uses and management strategies relevant to the project area.

Alternatives Commentary

UDOT has determined that it will carry three alternatives forward to detailed analysis in a DEIS. For efficiency these can be characterized as 1) enhanced bus w/o road widening, 2) enhanced bus with road widening, and 3) gondola. In this section we will provide comments and ask questions about the various elements of the alternatives.

Our overarching concern is that evaluation of simply running more buses without associated infrastructure (lane/shoulder widening, snowsheds, and/or berms) should be included as an alternative. This shouldn't be considered solely as an option within the canyons, but also included on the approaches to these canyons, intersecting with existing or planned canyon transit routes. We believe the best transportation improvement to implement now, especially given that UDOT is proceeding in the absence of a comprehensive regional transportation plan, is one that would improve on the present while having a comparatively modest price tag, causing little environmental impact, and being the least prejudicial to future choices. The alternative that clearly best possesses these qualities, and that distinguishes it from the other bus alternative, is enhanced bus service, without any widening of LCC highway or unnecessary avalanche sheds (more on this later).

Giving people the opportunity to get to canyon destinations (resorts, trailheads, etc), without vehicles in the first place, could yield the single greatest benefit to the roadway, the watershed and the canyon in general. With improved transit service being the clear opportunity to address regional transportation issues, it begs the question - why is a highway entity (UDOT) conducting transit analysis, which could be done by a transit entity like the Federal Transit Agency (FTA) in partnership with UTA & UDOT. As raised in earlier comments on scoping, purpose and needs, and screening criteria (all of which are incorporated by reference) we question UDOT's authority

granted by the US DOT, which is specifically tied to roadway improvements, and explicitly states UDOT does not have authority to do transit analysis.

Simply put, running more buses is a modest solution that clearly can be made to achieve a significant improvement. Even if it were eventually to be seen as not fully adequate, there is considerable value in achieving an improvement even for just a portion of the present 30-year planning horizon. Costs will have been saved (even if only through deferral), and future LCC planning efforts will benefit from consideration of then existing circumstances—and maybe even of a true regional transportation plan.

Mobility Hubs

The most critical element shared by all alternatives is the reliance on “mobility hubs.” The obvious problem that these create, especially if they are fully utilized, is that they interrupt progress up the canyon, they are highly concentrated, intermediate nodes that are cumbersome and time consuming for travelers to negotiate, and they create their own congestion problems. If improvements in LCC were part of a sensible, comprehensive transportation plan, canyon visitors would migrate from many small, easily reached and negotiated nodes throughout the Salt Lake Valley.

There are also human factors that suggest that these two concentrated nodes will not function as planned. As travelers in personal vehicles approach these nodes, assuming they are willing to consider transferring to a bus (or bus plus gondola), they will frequently be put to a decision about what is optimal for them. Their uncertainty will be because they don’t know if they will find parking, and, even if some technology is in place to tell them parking is not full, they still don’t have a good idea of how long the transition will require, given the remaining uncertainties about the time needed to find an open stall, its distance from the bus pick up area, and whether they’re going to just miss a bus and have to wait the full interval to the next one. While skipping transit and continuing up the canyon brings the potential for its own delays, travelers know that, delays being equal, driving will be faster. In the absence of reliable information indicating one mode will delay their progress more than the other, they will tend to see the risk as equal. This will naturally tip the balance toward driving, generally the faster mode of transportation. In other words, what will go through travelers’ minds is, “I don’t know that one will delay me more than the other, so I’m going to choose the mode that’s generally faster and requiring significantly less transfers.”

Of course, the bigger the difference in inherent travel times between the two choices, the greater the inducement to resolve uncertainty in favor of driving. We would therefore expect this to be a very large factor, if the alternative to driving is a gondola, given that is projected to take a whopping 63 minutes.

Further compounding the ineffectiveness of the mobility hub, which again are the cornerstone of the alternatives is location and shared use by visitors to other canyons. The larger, and arguably the most critical hub resides adjacent the mouth of Big Cottonwood Canyon. This hub, would naturally be used by those organizing carpools, visiting resorts, destinations in other canyons. One could estimate that easily 50% of the spaces would be utilized by vehicles (and thereby visitors) not utilizing one of the modes (gondola or bus) being analyzed in the EIS, unless UDOT

is somehow planning to restrict this publicly funded garage for use by resort patrons going to Snowbird and Alta only. This would further reduce the effectiveness of getting people on transit as these hubs are necessary for any of the alternatives to be successful, since request to look at improving the frequency and volumes of transit access to the mouths of these canyons (Big Cottonwood and Little Cottonwood) have been repeatedly deemed out of scope.

Simply put, in the absence of a system that delivers people to the mobility hubs without cars, the alternatives' effectiveness have a fatal flaw, which is constrained by parking, which as proposed (or even as proposed by other gondola proposals), will force more vehicular traffic on the roadways, thereby failing to address the purpose and need of the EIS. This is in part, why we have suggested repeatedly throughout the process, to make transportation effective in these canyons, we need to do more to remove cars destined for these canyons, well before they reach the canyons. It is also, why the scope and focus on Wasatch Blvd and SR210 is a disservice to the region, and thereby this project for it fails to address the inter-related nature of the canyons, their visitors, and how people utilize the region.

Trailhead Parking Expansion

The 2003 USFS Revised Forest Plan clearly states:

“Protection of watershed conditions will be a primary factor in managing roads, trails and access. In the Tri-canyon area (Big and Little Cottonwood Canyons and Mill Creek) parking capacities of canyon parking lots (ski areas, summer use homes, developed and dispersed recreation sites) will be not exceed [year] 2000 levels unless modification is needed for watershed protection or to facilitate mass transit. Mass transit will be commonly used during winter, reducing crowding and increasing safety for users of the canyons. The Forest Service will work actively with other parties to explore options for reducing private vehicular use within these Canyons.”

UDOT has interpreted this to mean, apparently, that if they close down road side parking, that was happening prior to the year 2000, they can replace these stalls in formalized parking lots. Several issues exist with this logic and approach. As the paragraph from the Forest Plan states the reason and rationale for no more parking is because of watershed conditions. There is a direct impact on watershed from increasing impervious surfaces, thus the prohibition on parking is really about reducing the amount of impervious surfaces, alteration of hydrology, and introduction of pollutants to our water supply. Limiting parking is also a strategy to limit visitation in adherence to the infrastructure available at sites throughout the canyon. Bathrooms, for instance have a capacity. UDOT's failure and refusal to restrict parking on its roads has created unsanitary conditions, created threats to our water supply, created stressors on funding streams to other agencies, notably the USFS and Salt Lake City, who have had to allocate additional dollars to keep up with the overflowing visitation and unsafe condition UDOT has allowed to happen along its highways — in direct conflict with the Forest Plan. Attempting to accomplish your goals at the expense of other policies and strategies of protecting water quality is abominable and this EIS is not and should not be the forum for forcing a revision to the forest plan which arguably has higher importance and a focus on water quality. Transportation and parking should be a tool to meet other goals for this landscape, not a hostile initiative that comes at the expense of other strategies, which the state continually tries to undermine (through this and other efforts).

Further, the Forest Plan pertains only to the public lands managed and administered by the US Forest Service as disclosed in the plan. If roadside parking was such an issue for UDOT, it could have been addressed years ago at the discretion of UDOT by simply signing and enforcing closures to protect its infrastructure and increase safety - as noted in response to previous comments in the screening report. That said, if it couldn't take such measures, it would be because the roadway easements are not perfected, that is to say, still under the authority of the USFS. If this is the case, it would seem that this entire EIS is null and void as UDOT does not have the authority to conduct an EIS on USFS lands. This begs the question central to this entire process - who's authority does the land within UDOT's project area reside with? The USFS, UDOT, Salt Lake City, other? Is it a combination? The public deserves to understand and UDOT as the proponent, has an obligation to disclose this information to the public. It has come to our attention that commensurate with this EIS, UDOT is going through the process of perfecting some of its easements within the project area, which begs the question, if the easements are not perfected, why is the agency leading something for which it has no jurisdiction? We request clarification and transparency on these issues.

It is clear that strategies to deal with trailhead parking, capacity, access and amenities need to be revisited. This shortsighted EIS focused on the roadway, and only during the ski season, not the resource, is not an appropriate forum for this conversation. If the jurisdictions of relevance disagree, reasoning and rationale for doing an end-run on the Forest Plan need to be furnished to the public. This EIS is not a resource management planning effort, though it attempts to undertake actions that undo strategies that have been working, with the caveat that the weaknesses of the strategy lie solely with the discretion of UDOT (allowing roadside parking and overwhelming planned trailhead capacities).

Snowsheds & Berms

Included in both enhanced bus alternatives is construction of avalanche shelters, so apparently UDOT sees them as essential for any surface transportation solution. However, even a slightly careful parsing of the data UDOT presents related to avalanches cast doubt on this judgment. In particular, the data setting forth days with avalanche-related closures and hours of closure do not very well reflect the fact that the vast majority of those closure periods are for planned closures, very largely occurring at hours of the day when there is relatively little demand for the highway. What a more careful look at the data reveals is that shelters' actual efficacy, in terms of providing additional hours the highway is open to serve significant demand, is quite low. This means, given the cost of these structures, that, over the planning time horizon, the additional high-value hours the highway is open will each cost tens of thousands of dollars.

The data presented in the EIS suggests that the benefit of the avalanche sheds takes us from an average of 10 days of closure, to between 4 and 6 days of closure. This is a massive impact on the geologic magnificence, hydrology, water quality, wildlife, the glacial carving of these canyon, to name a few, for a minuscule benefit. While we understand the resorts are concerned about the economic impact of avalanches to their businesses, this condition was in existence and part of the reality of operating in these environments (not to mention the very nature of their businesses). The impact to the canyon far outweighs and benefit, and it might be a more fiscally responsible

Avalanche Mitigation

Trailhead and Roadside Parking

Travel Demand Management

Avalanche Mitigation Alternatives

Canyon Closures AHI Alternatives Screeni Level 1 Screening

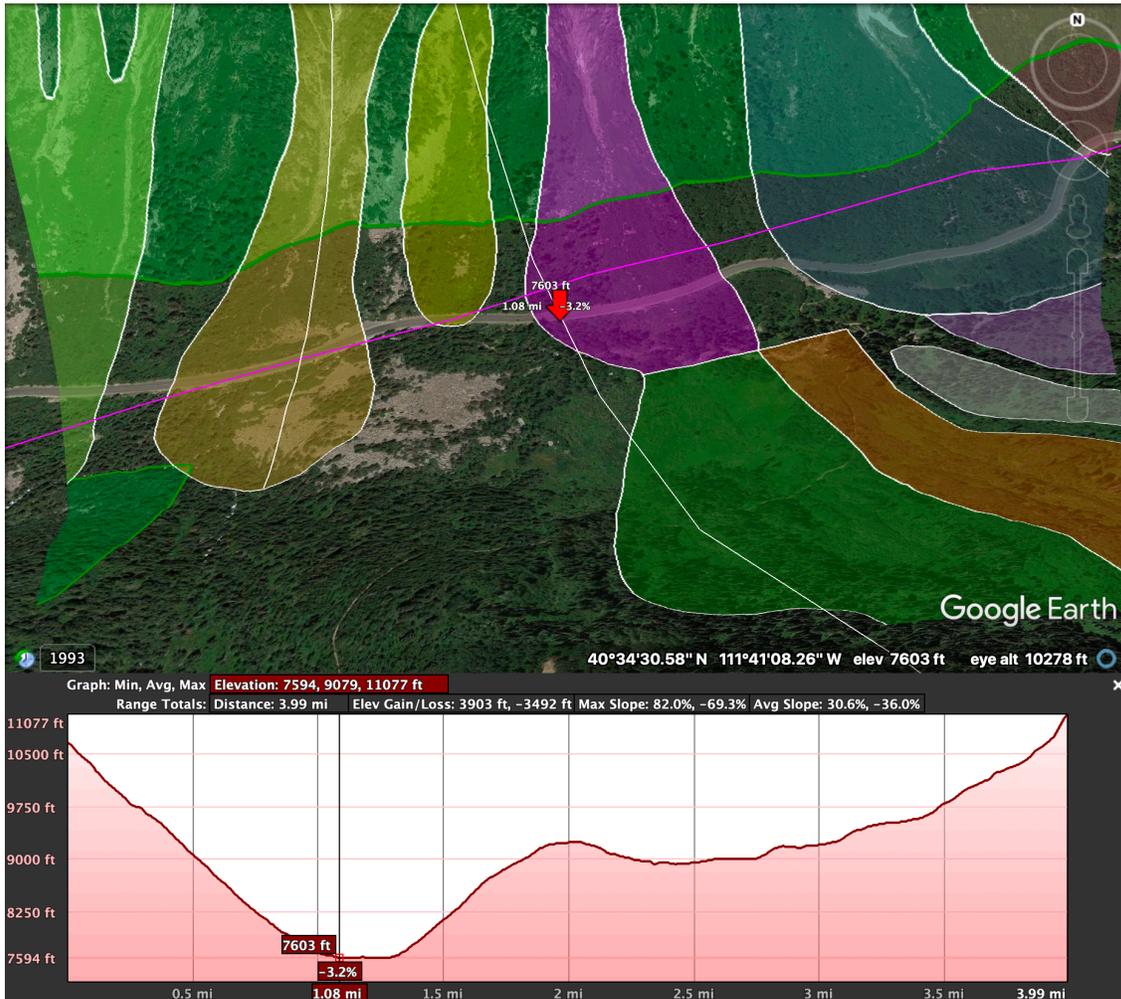

Level 1 Screening Results Table

Concept	Traffic (vehicles/day)	AHI	Average Days of Closures	Average Hours of Closures	Estimated Cost (2018 dollars)
Current avalanche mitigation strategies – 2018 traffic volumes	8,200	90	10.4	56.3	Not applicable
Current avalanche mitigation strategies – 2050 traffic volumes	11,300	96	10.5 to 21	56 to 108+	<\$50 million
Snow shed with 2050 traffic volumes	11,300	59	4 to 6	2 to 11	\$70–\$90 million
Gondola with 2050 traffic volumes	1,000+	37	10.5 to 21	56 to 108+	\$312–\$343 million

option to compensate them (or patrons) for inability to access these areas due to too much snow, rather than destroy a canyon to get a few more days of skiing.

Further, these snowsheds will need to be massive in order to propel the avalanches across the highway. The location of the roadway is near the foot/fan of these avalanche paths. A compounding factor is that the glacial “U” shaped nature of Little Cottonwood Canyon, means the areas in the canyon where you are looking to place the avalanche sheds, flatten out as they approach the stream. According to Mears and Wilbur, avalanche sheds require calculation of “design avalanche velocity, impact pressure and flowing height be calculated in advance.” A cross-section of the canyon (below), helps to demonstrate this, with the arrow located on the roadway. It seems based on our research and experience dealing with avalanches, this type of mitigation is most appropriate where the avalanche has a high velocity, but because of the terrain and the canyon steepness, the avalanches have began to lose velocity, as noted by the fan shape that occurs near the roadway.

Our concern here is that the structure will need to be massive in order to ensure the fate that hit the snowshed on Red Mountain Pass in Colorado, where an avalanche filled the snowshed and took weeks to excavate, could be a more frequent occurrence here if the shape of the canyon isn’t significantly altered. Because of the location of the shed in the depositional state of the avalanche, it will also require frequent maintenance to ensure it is effect in keeping snow moving, rather than creating a massive snow bridge. You can see most sheds exist much higher in the velocity zone of the avalanche, not the fan. Some information on the Red Mountain Pass avalanche shed failure can be viewed here: <https://durangoherald.com/articles/267167>

While the 56 hours of closure might sound significant, it is important to temper this with an understanding of when these hours coincide with visitation. Many closures take place overnight when the canyon sees little, if any, traffic. To better understand the cost benefit analysis, we should be better informed as to how the closures intersect with the 30th busiest hour — which is the focal point of this EIS.

SR 210 Additional Lane/Shoulder widening

Widening the roadway is merely a proposal to increase vehicular capacity. As we’ve mentioned, and will mention, all of the alternatives will most likely induce more cars. The demand for these places, far outpaces the capacity of the canyon, or the amenities to serve the visitors. At this point, UDOT should realize that additional lanes don’t solve traffic problems, they just add more cars into the problem, further degrading air quality.

If we were to have a project, that proposed legitimate transportation alternatives that reduced the number of vehicles by 50% and doubled vehicular occupancy, we’d not only make headway on solving canyon visitation issues, but would improve upon environmental conditions and meet UDOTs safety goals. Sadly, UDOT believes these types of alternatives are out of scope and have ruled out legitimate transit solutions. We can change behaviors surrounding canyon access, rather

than changing the nature of these canyons, if only UDOT would listen and engage with entities who want to help you meet your goals in a less intensive and invasive manner.

Gondola

The problems with the gondola, and the data supporting it, are many.

Its most obvious problem is fundamental, as a form of transportation — it takes too long to get where it's going. By itself, this creates a large imbalance in the most basic element of the motivational system driving canyon visitors' choices of transportation. Accordingly, it would require development of a variety of strong, perhaps even rather draconian, motivational offsets to drive people to use it instead of driving private vehicles. But the time required for travel is not the only off-putting aspect of the gondola; it also requires an additional transfer between two modes of transport. This requires some effort on the part of travelers, and also serves as kind of a psychological burden to them distinct from the additional time and effort this transfer adds to the journey.

Numerous transit studies, that one wouldn't expect a highway building company to trouble itself with understanding, identify the Achilles heel of transit systems are the number of transfers/mode shifts a system introduces. This proposal forces three: car to bus, bus to gondola, gondola to destination. Not only is this a huge disincentive to use, but it also by design, eliminates the likelihood that connecting modes of transit would be used to get to the mobility hub (or even the gondola base, were it an option) as the acceptable number of transfers is exhausted by the complicated system. With a system that by UDOT's own admission (not to mention the desires of the Utah Legislature and Governor) being built primarily for tourists and economic development, patrons will be forced to not only move themselves and their gear, but assist the young and the elderly in moving themselves and their gear making transfers even more arduous.

A basic goal of all the forms of transportation UDOT has assessed is reducing private vehicle use. The data supporting the reduction achieved by constructing a gondola is either in error or grossly misleading. Table 3-4 in the Alternative Screening Report claims that, with the gondola, vehicle use will be "1,000+" per day at year 2050, down from 8,200 at year 2018 and 11,300 at year 2050 with no gondola. The only way the numbers can support this reduction is by attributing projected maximum occupancy of the gondola, or something very close to it, for 24 hours per day! If this calculation fairly considered reality — that there are peak travel hours throughout the day (these peaks supported by UDOT's own data) — the result would obviously be that many times that number of vehicles would take the highway every day. When asked in our June 16, 2020 meeting with UDOT if the gondola capacity would ever increase beyond the approximate 1,000 people per hour (30 cabins) the agency responded they would not ever anticipate needing more capacity for the gondola. The peak travel hours are between approximately 8am and 11am (east bound), and in the afternoon between 2:30pm and 5:30pm. In each of these three hour windows, the gondola would transport approximately 3,000 people and the roadway would need to hold the remaining 15,000 - 19,000 people, according to UDOT's forecasted demand of 22,000. Massive roadway failures would still exist in the gondola scenario.

As the figure above in the snowshed section shows, road closures will increase in the gondola scenario from the 10.4 days we would expect to potentially 21 days. As pointed out in the prior

paragraph, the roadway will still play a critical role in transporting at least 15,000 people. In what world is this proposal an improvement to conditions? It boggles the mind that this was allowed through what appears to be a politically motivated screen, that is riddled with holes and defies any and all logic.

Visual impacts of the gondola would be incredibly destructive to the canyon. One of the most stunning and significant features of Little Cottonwood Canyon is that it is a unique, glacially carved canyon. The gondola would be a blight on the landscape and the unique geologic character of the canyon which is appreciated by local communities and various recreationists. The visual impact to the beneficiaries of the gondola (Snowbird and Alta) are far less than to the other users and communities who see no benefit, but are going to have to bear the burdens of the system from environmental, visual, noise, monetary, and physical displacement standpoints.

What more is that the towers, load/unloading and angle stations for the gondola clearly go outside the defined project area of the roadway and undisclosed roadway easements. This should not only trigger more USFS involvement, but possibly other entities who have legal obligations for values higher than roadway travel (ie. watershed, wildlife, resources management). Numerous comments to expand the scope beyond the roadway were rejected by UDOT, as such they should be held to the same standard to only propose alternatives that reside within the project area they defined.

Even more distressing than the apparent disingenuous data supporting gondola construction is that there clearly appears to be, in effect, an undisclosed element of the purpose and need for the LCC project that UDOT considered completely outside of the NEPA process. In a video conference hosted by UDOT that I attended, UDOT stated that a factor UDOT viewed as favorable to the gondola but not mentioned in the Screening Report is that, in addition to providing needed transportation, the gondola would also serve as a tourist attraction. The precise words conveyed clearly to me that the UDOT representative speaking meant that the gondola's caché for tourism was a factor separate from its role in addressing existing transportation problems, it was not brought up in any context that suggested that the gondola's novelty would be reasonably relevant to the goals spelled out for the project. While it was disappointing to learn that UDOT had introduced a previously unidentified factor in its decision making, it also makes sense that there would be some unstated factor in favor of the gondola, because its liabilities are so substantial that it is otherwise something of a mystery how it survived to advance to detailed consideration in the DEIS.

Many others participated in that same video meeting and heard this statement and understood it just as I did. It is also my understanding that this was hardly the only occasion on which UDOT has acknowledged that it viewed the gondola's attraction to tourists as an additional favorable attribute.

Be clear: there are no "extra" or informal factors that play any role in the identification of alternatives in a NEPA process; they all must be disclosed and subjected to scrutiny within the NEPA process. What occurred in UDOT's selection of alternatives for LCC represents a corruption of this process, and it cannot easily be explained away and it will not be easily cured.

Climate Analysis

Numerous studies for this region suggest the Wasatch will become hotter and dryer as human caused climate change wreaks havoc on our already arid region. Less precipitation will fall as snow, and more of it will fall as rain. We are already experiencing this as we see rain falling at the base of ski areas during the winter months. Despite this well documented trend, UDOT seems to conclude in its avalanche closure forecast that if we do nothing, avalanche closures will increase beyond today's average, rather than decreasing as the climate trends suggest.

Canyon closures and the policies surrounding them, are not driven by climate, rather operational decisions by UDOT. The climate memo included as part of this EIS makes no conclusive nexus between climate and storms, and therefore the assumption that canyon closures will increase is inconclusive, suggesting the assumption of increasing the average days of closure is a hollow attempt to justify alternatives, in the absence of sound science. Given the research on drying, desertification of our region, and the fact that larger storms are known to be a function of lake effect (from lakes that are shrinking), one would conclude, avalanche closures would perhaps trend toward a 50% reduction with no mitigation, rather than the stated 200% increase in closures.

Given the important ecosystem services that these canyons provide, and the compounding pressures of climate change on water resources. A more thorough understanding of the impacts climate will have on this region must be contemplated as these dynamic conditions may result in significant changes not only to the environments, but to the roadway and UDOT's activities within the planning horizon. Note the recent landslide events taking place in the summer due to the over saturation of soils from major precipitation events as well, caused in part due to the instabilities caused by cut/fill slopes, which your project seek to expand. Climate change poses numerous and nuanced vulnerabilities and threats to these watersheds.

Reasonably Foreseeable Cumulative Impacts Analysis

There are a number of factors associated with this EIS that must be analyzed. A rudimentary NEPA example is that of a FS improving a road for a timber sale. Simply analyzing the roadway, without also understanding the impacts of the timber sale would be a failure to consider cumulative impacts associated with the roadway improvements. For this project, UDOT is proposing to improve the roadway for the purposes of inducing visitation to arguably one of the state's most precious watersheds. Both federal land managers and local watershed managers tasked with stewarding this resources acknowledge that increased visitation and the associated amenities needed to mitigate impacts to the watershed are the #1 threats to this area. As such, it would be an error to not assess the impact on additional visitation on our watersheds that would result from the alternatives. In order to do this, UDOT must first understand the thresholds for this canyon, and potentially for other canyons. This should be done in concert with the resource managers who are inevitably going to have to manage the herds UDOT and the ski industry induce to these watersheds.

Additionally, as it pertains to the gondola proposal, UDOT must look at the impacts of a full interconnect as it is embarking on building a phase in realizing "Utah's Interconnected Ski Industry" as laid out in SCR 10 - Concurrent Resolution Supporting Utah's Interconnected Ski and Snowboard Industry. This has an effective date of 3/16/2012. It is within this resolution that

the state “urges meaningful and balanced public involvement, in any associated planning and decision making processes regarding resort interconnections’ and supports a comprehensive set of solutions to transportation problems in the Wasatch Mountains, including short and long term alternatives.” The President of the Senate, and same person who co-sponsored the bill authorizing funding for this process (SB277), Sen. Wayne Niederhauser, was the sponsor of this bill. The State of Utah, being the primary instigator of the Little Cottonwood EIS, who also demonstrated its motives to be an interconnected ski industry with SCR10, means that the driver and reasonably foreseeable outcome from this EIS is to construct phase one of this vision and therefore the impacts of the entire interconnect should be evaluated as part of this EIS. This motivation has been hidden from public view and needs to be brought into the process so that they can better understand the impacts to their watershed, public lands, and recreational pursuits, all of which are at the core of the quality of life we enjoy.

New information on the project site

Throughout the comment period, new and refined information has been showing up on the project site. It has made it very difficult to respond to the volumes of information, let alone having new information popping up during a comment period. Further, some people have commented and may not have seen this information resulting in some of those comments being inadvertently incomplete. For example, new interactive GIS maps, information about gondola towers, stations, etc were released after the comment period started. People wouldn’t know this information was there as it wasn’t in the first week of the 4-week comment period.

Additionally, numerous reports of people not being able to submit comments, or having their comments rejected, were reported to our organization. This should warrant an extension and republication of the comment period. Public comment is at the heart of an EIS and new information and inadequate communication forms appear to be two ways that UDOT has hindered public involvement.

Conclusion

A fair analysis of a running more buses in these canyons without the addition of lanes, berms and avalanche sheds with an emphasis on increased carpooling strategies and regional transit connectivity is requested. Such a system would not only meet UDOT’s goals, but would be more harmonious with the goals of other agencies and governments in the region. We recognize that analyzing transit solutions is a limitation for a highway agency and it should do more to bring transit expertise into the project. It appears to be an agency choice (or political mandate), grounded in analysis that is riddled with holes, that has lead to a more hostile approach that will be damaging to the multiple values and interests in these canyons. Good projects are grounded in good partnerships, and good partnerships beget good decisions. Those partnerships be it with us or other governments, as you are seeing in comments, are token, at best.

More, we are dismayed that the many regulatory and enforcement options available to UDOT to better manage the roadway, that could have a direct benefit to the purpose and need, have not even been attempted to be pursued. Rather, building additional infrastructure, altering hydrology and impacting the environment is the start and end point of the agency. It should be noted that

pursuit of the regulatory options would have de minimus impact on the environmental conditions, and should be prioritized, thoroughly vetted, and explored.

We have attempted to be thorough and exhaustive, but as you are learning, this landscape is important and complicated. We wish UDOT would do more to demonstrate care and be a partner in solving the root of the problems, rather than aiding the two commercial enterprises in the canyons at the expense of the numerous other values in the Wasatch. We will continue to engage, but if you have questions about some of the information we've provided, we are always available to help clarify and explain. Just because other mountainous regions have employed certain strategies, does not mean they are appropriate in these canyons. The Wasatch is simply not as vast as other areas, be it the Alps or the Rocky Mountains or the Sierra. Quite the contrary, they are incredibly compact, and provide critical resources to a huge population. Sage stewardship and management to realize a shared vision should drive this process, not economic development and enrichment of private companies at the expense of the public trust, which includes but is not limited to the lands, waters, and tax dollars, being leveraged by this process.

Sincerely,

Carl Fisher

1 **CONCURRENT RESOLUTION SUPPORTING UTAH'S**
2 **INTERCONNECTED SKI AND SNOWBOARD INDUSTRY**

3 2012 GENERAL SESSION

4 STATE OF UTAH

5 **Chief Sponsor: Wayne L. Niederhauser**

6 House Sponsor: Ryan D. Wilcox

8 **LONG TITLE**

9 **General Description:**

10 This concurrent resolution of the Legislature and the Governor expresses support for
11 interconnection of the seven Salt Lake County and Summit County ski resorts.

12 **Highlighted Provisions:**

13 This resolution:

14 ▶ expresses support for low-impact interconnection of the seven resorts in Salt Lake
15 County and Summit County to enhance the ski and snowboard resort industry's
16 contribution to Utah's economy, jobs, and tax base;

17 ▶ urges interconnection of the Salt Lake County and Summit County ski resorts using
18 best environmental practices;

19 ▶ supports thorough consideration of multiple uses in the Wasatch Mountains in the
20 evaluation of resort interconnections;

21 ▶ urges meaningful and balanced public involvement in any associated planning and
22 decision-making processes regarding resort interconnections; and

23 ▶ supports a comprehensive set of solutions to transportation problems in the Wasatch
24 Mountains, including short term and long term alternatives, potential year-round
25 utilization and support of Utah's vibrant human-powered outdoor recreation.

26 **Special Clauses:**

27 None

28
29 *Be it resolved by the Legislature of the state of Utah, the Governor concurring therein:*

30 WHEREAS, tourism is one of Utah's major "export industries" that sells services or
31 products to destination visitors and brings money into the state to support our local economy
32 and provide jobs for current and future Utahns;

33 WHEREAS, over 20 million people visited the state of Utah in 2010, spending over
34 \$6.5 billion, or 5.5% of Utah's gross domestic product, contributing over \$840 million in state
35 and local taxes, and sustaining as much as 10% of the jobs in the state;

36 WHEREAS, the ski and snowboard industry is a major contributor to Utah's tourism
37 industry, contributing over \$1.2 billion to the state's economy as a result of over 4 million skier
38 days, and growth in the ski and snowboard industry will bring additional spending, revenue,
39 and jobs to the state;

40 WHEREAS, tourists who ski or snowboard in Utah spend money on lift tickets,
41 equipment rentals, hotels, restaurants, car rentals, and other matters, and this money circulates
42 through the economy, supporting over 20,000 local jobs;

43 WHEREAS, the seven ski resorts in Summit County and Salt Lake County are all
44 located in close proximity to one another, offering the opportunity to connect these resorts, an
45 opportunity that leading competing winter tourism states do not have;

46 WHEREAS, connecting the ski resorts in Summit County and Salt Lake County will
47 create a skiing experience unavailable anywhere else in North America and reposition Utah's
48 ski and snowboard experience to be even more competitive and attractive relative to other
49 states, leading to increased tourist visitation and spending, which will in turn lead to an
50 increase in revenue and jobs;

51 WHEREAS, it is recognized that Big and Little Cottonwood Canyons are critical
52 watersheds from which more than 500,000 Utah residents, businesses, and visitors throughout
53 Salt Lake County receive their drinking water, and that best management practices would be
54 required in any potential resort connections;

55 WHEREAS, the balance of multiple uses in the Wasatch Mountains, including
56 developed recreation, such as skiing and picnicking, and dispersed recreation, such as hiking,
57 mountain biking, and back country skiing, are highly valued by residents, visitors, and

58 businesses in Utah and contribute significantly to the state's economy and quality of life;

59 WHEREAS, the roads to ski areas in Summit County and Salt Lake County are
60 congested during certain times of the year, and studies should be conducted by numerous
61 federal, state, local, and private sector entities to comprehensively evaluate alternatives to solve
62 transportation problems;

63 WHEREAS, connecting the ski resorts in Summit County and Salt Lake County will
64 improve access to the ski resorts and allow the unique opportunity of skiing at multiple resorts
65 in a single day;

66 WHEREAS, connecting the ski resorts in Summit County and Salt Lake County is an
67 issue of state concern because the connection will cross county boundaries, have a
68 tremendously positive impact on the state economy, and may contribute positively to state
69 roadways and airsheds;

70 WHEREAS, connecting ski resorts will allow the winter sports industry to grow while
71 making the most efficient and sustainable use of ski terrain, roads, facilities, and parking lots;

72 WHEREAS, connecting the ski resorts in Summit County and Salt Lake County may
73 require review and approval of permits by Summit County, Salt Lake County, Salt Lake City,
74 Park City, the town of Alta, and the United States Forest Service;

75 WHEREAS, the public will be engaged in meaningful and balanced ways in any
76 potential decision-making processes regarding resort interconnections, and these processes will
77 be open and transparent;

78 WHEREAS, many skiers drive from Summit County to ski in the Cottonwood
79 Canyons, or from one Cottonwood Canyon resort to ski in Summit County or at another
80 Cottonwood Canyon resort, contributing to congestion on canyon roads;

81 WHEREAS, connecting the ski resorts in Summit County and Salt Lake County will
82 decrease traffic on congested canyon roads and lead to cleaner air and water by reducing
83 automobile-related pollution, and provide emergency evacuation options for Big and Little
84 Cottonwood canyons;

85 WHEREAS, the 1988 Governor's Task Force on Interconnect concluded that

86 interconnecting the Wasatch ski resorts "would provide a substantial boost to Utah's ski
87 industry and have a positive influence on the state's economy"; and

88 WHEREAS, the Wasatch Mountains Inter-Resort Transportation Study, completed by
89 Mountainland Association of Governments in 1990, found that connecting the Wasatch resorts
90 "hold[s] the promise of substantial public benefits in the form of reductions in automobile
91 traffic on congested canyon roadways, watershed and environmental pollution abatement,
92 increased slow-season occupancy of existing facilities, and the potential for future economic
93 expansion":

94 NOW, THEREFORE, BE IT RESOLVED that the Legislature of the state of Utah, the
95 Governor concurring therein, support connecting the seven ski resorts in Summit County and
96 Salt Lake County with an inter-resort transportation system based on sound research and
97 balanced public input, and careful evaluation of its impact on transportation, the economy, job
98 creation, the environment, multiple uses, and visitor experience.

99 BE IT FURTHER RESOLVED that the Legislature and Governor encourage Summit
100 County, Salt Lake County, Salt Lake City, Park City, the town of Alta, and the United States
101 Forest Service to fairly consider the benefits of connecting the various resorts and
102 expeditiously approve a low-impact inter-resort transportation system based on appropriate
103 analysis and balanced public input.

104 BE IT FURTHER RESOLVED that a copy of this resolution be sent to the Summit
105 County Council, the Summit County Manager, the mayor of Park City, the Park City Council,
106 the Salt Lake County Council, the town of Alta, the Mayor of Salt Lake County, the Salt Lake
107 City Council, the Mayor of Salt Lake City, the Chief of the National Forest Service, the
108 Uinta-Wasatch-Cache National Forest Supervisor, the Speaker of the United States House of
109 Representatives, the Majority Leader of the United States Senate, and all members of the Utah
110 Congressional Delegation.

Re: Salt Lake County Mayor's Administration Comments
Draft Alternatives Development and Screening Report
Little Cottonwood Canyon Environmental Impact Statement
S.R.210 – Wasatch Boulevard to Alta
June 8, 2020

Dear UDOT Project Team:

The following letter provides comments from the Salt Lake County Mayor's Office to the Utah Department of Transportation (UDOT) Draft Alternatives Development and Screening Report, Little Cottonwood Canyon Environmental Impact Statement (EIS) for the Little Cottonwood Canyon (S.R. 210) - Wasatch Boulevard to Alta dated June 8, 2020 (Report). On behalf of Salt Lake County (a Participating Agency), we remain grateful for the work that UDOT and its partners have performed to date on the EIS process and we look forward to continuing to participate in this critically important endeavor.

At present, my team and I are electing to refrain from promoting one proposed transportation alternative over another. Rather, we intend to wait for the additional alternative evaluation and refined engineering that will be set forth in the draft EIS (expected to be released in Spring 2021). We understand that the National Environmental Policy Act (NEPA) process provides for a detailed analysis of the environmental, social, and economic impacts of the proposed transportation alternatives, and we look forward to the opportunity to consider that more refined analysis.

By way of background, please note that, on June 9th, 2020, the Salt Lake County Council adopted a new Wasatch Canyons General Plan (WCGP). The WCGP was the culmination of a 3-year effort to update the prior general plan pursuant to an extensive public engagement process. The WCGP includes vision statements, goals, strategies, and policies for Little Cottonwood Canyon (LCC) and other nearby canyons. The elements in the WCGP include housing, land-use, transportation, environment, recreation, and the economy. Relevant information from the WCGP will be mentioned throughout this response (and a link to the document can be found below).

Please note that the issues outlined below are not prioritized in any particular order and represent the comments of my office and not necessarily the Salt Lake County Council.

Issue #1: Social Equity / Access

We recommend that an evaluation of social equity - as it relates to transportation issues - be conducted to ensure that LCC remains accessible to a broad swath of our community regardless of economic status or zip code. The assets of LCC that are publicly owned and managed by the USDA Forest Service should be accessible to all users of S.R. 210. Transportation expenses typically amount to the second largest cost of a household. As a result, methods to mitigate inequity should be considered when selecting a transportation alternative and considering tactics such as tolling. A few methods to consider include transit subsidies and seasonal or variable tolling (including variable rates and/or locating "toll booth" locations further up the canyon).

Issue #2: Transportation Environmental Impacts

The WCGP addresses various issues related to environmental management in the canyons. These issues include water and air quality, wildlife preservation, native plant protection, and preserving open space. We request that the draft EIS include a detailed analysis regarding how the proposed alternatives might affect these types of environmental issues. Air quality is of particular concern to the residents of Salt Lake County. We respectfully request that UDOT consider non-emitting sources of transportation.

For example, should a bus option ultimately be selected, we encourage a consideration of electrification of the bus system, coupled with the necessary infrastructure. Savings on fuel and maintenance will help mitigate much of the cost associated with the integration of EBuses. On average, the fuel efficiency of electric fleets is estimated to be 16.5 miles per gallon equivalent compared with 3.8 miles per gallon for a diesel fleet, and the fuel per mile cost of electric buses is estimated to be \$0.28 compared with \$0.59 for diesel. Similarly, maintenance costs for electric buses are estimated to be \$0.55 per mile compared with \$1.53 for a diesel fleet. The purchase cost of natural gas-powered buses starts at around \$450,000, while an electric version starts at around \$700,000. However, “lifetime” estimates suggest that an electric bus can save roughly \$400,000 in fuel expenses and roughly \$125,000 in averted maintenance costs, more than making up for the higher upfront cost. In addition, these costs are estimated in today’s prices. It is anticipated that costs for EBuses will fall even further in the future (when the buses would actually be purchased), thus leading to additional potential savings.

Concerns over EBuses ability to operate in challenging winter-time conditions can be mitigated. Utah’s own Park City has been successfully operating EBuses in these conditions for the last several years. In addition, EBus companies have tested the viability of a LCC route, with no apparent major issues presented.

Additionally, EBus infrastructure can be used to support electric vehicle use, especially if partnering agencies utilize smart grid management practices. Doing so will not only lead to electrical cost savings, it will also prevent the release of hundreds of pounds of particulate matter locally and thousands of pounds of CO₂ from entering our airshed every year.

For all three proposed alternatives, we recommend consideration be given to utilizing power from renewable energy sources. Both the bus and gondola alternatives will require large amounts of electricity to operate. Renewable energy is on average the cheapest source of energy available. Current rates for solar are between \$32-42 per kW for solar and \$28-\$54 for wind. That is compared to \$66-\$152 for coal and \$44-\$68 for natural gas.

Stormwater runoff is another area of concern. Any significant road widening project poses a potential increased danger of contamination to waterways in LCC. We recommend that UDOT take this risk into consideration and work with appropriate parties to prevent waterway pollution created from any new roadway infrastructure. For a more detailed assessment on this subject, please see Salt Lake City’s comprehensive comments on the Report regarding the LCC watershed.

As part of the next phase of this process, we recommend consideration be given to construction related issues, particularly with regard to the emissions profile of vehicles and equipment. Older and lower tier engines should be reduced and ultimately eliminated, and steps should be taken incentivize potential contractors and subcontractors to ensure that their equipment meets the EPA standards for Tier 4 engines.

Regardless of which alternative is ultimately recommended, we request that priority be given to mitigating landscape degradation, addressing visual impacts (e.g., on account of project footprint) and keeping environmental and land impacts to a minimum.

Issue #3: Year-Round Availability

We also request consideration be given to the year-round use of the contemplated transportation options. LCC offers recreational opportunities in all seasons and we request that such year-round accommodation be considered in the refined analysis. We are particularly concerned about the viability of a bus system on a partial year basis. A system based on buses running for only one out of four seasons may pose logistical challenges for a transportation agency on account of the need to provide buses, drivers, and equipment for only a portion of the year.

Although we prefer consideration of a year-round option, as a possible alternative option, we request consideration of operations during “high demand” periods such as Oktoberfest and the Wasatch Wildflower Festival.

Year-round service options would have the added benefit of potentially reducing the impact of cars in LCC. In addition, we support the expansion, improvement, and enhanced maintenance of the trails system in LCC, all of which could increase the advantages of year-round options. As noted below, the WCGP supports year-round transit.

Issue #4: Visitor Management

We support the proposed research efforts between the University of Utah’s Outdoor Recreation, Education, and Tourism Laboratory and the Central Wasatch Commission to complete a comprehensive evaluation of the recreational uses of LCC. The results of this study will help to inform visitor management and the potential impacts that increased visitation might have on trails, viewing sites, geological features, and the natural landscape. We request further analysis on the concept of visitor capacity and how it might positively influence the visitor experience in LCC, as well as decrease human impacts to the natural environment and potential conflicts with wildlife.

As noted below, the WCGP supports the concept of a visitor management study, and we recommend that UDOT consider recommendations and limitations that might be set forth in any such study.

Issue #5: Mobility Hub

All three alternatives focus on the successful implementation of the mobility hub concept. We request further study on the mobility hubs. We are particularly concerned with the potential impacts on the communities in which the hubs will be located.

Issue #6: Compatibility with Wasatch Canyons General Plan (adopted by Salt Lake County in June 2020)

We believe that the WCGP should play an important part in the ongoing analysis of the proposed alternatives and should be evaluated for compliance and intent throughout the process. See the following links to the WCGP [summary](#) and [adopted plan](#) for your reference. In particular, we direct your attention to specific relevant provisions in the WCGP:

- **Environmental Vision:** “Serve as stewards to support healthy forests, connected ecosystems, habitats, and waterways for current and future generations. Promote programs that improve watersheds, air quality, vegetation, wildlife ecosystems, and scenic quality.” (pg. 31). Related “Guiding Principles” include:
 - “Water: Protect, maintain, and improve watershed health, water supply, and water quality.
 - Air: Protect and improve air quality for protection of public health, environmental health, and scenic visibility.” (pg. 31).
- **Transportation Vision:** “Support and prioritize projects for transit, bicycles, pedestrians, and improve mobility, air quality, safety, while connecting to the regional transportation system.” Related “Guiding Principles” include:
 - “Choice: Create convenient, safe, timely, sustainable, and efficient options for transportation by a variety of modes that satisfy multiple needs. Character: Promote context appropriate transportation modes and projects that are appropriate for each canyon’s unique context.”
 - “Accessibility: Provide well-maintained and accessible transportation infrastructure including roads, parking facilities, pathways, and walkways. Transit Stops: Create canyon transit routes to key destinations with ADA compliant transit stops that include restroom facilities, and bus pullouts for user comfort and aesthetics.” (pg. 33).
- **Economic Vision:** “Sustain the Wasatch Canyons as a world-class recreation destination that provides significant economic benefit to the region. Enable businesses to continue providing goods and services without compromising the environment.” Related “Guiding Principles” include:
 - “Tourism: Recognize that tourism is a fundamental component of the Utah economy and is dependent on healthy and abundant natural and scenic resources.
 - Stewardship: Encourage businesses to be environmental stewards through practices and educational outreach to customers and visitors.” (pg. 31).
- **Visitor Management Study:**
 - “County to consider the usage of visitor studies through collaboration and support of partner agencies, which may include Forest Service, SLCPU, UDOT, UTA, CWC, Town of Brighton, and Town of Alta. Visitor study assessments shall involve the public and support by partner agencies with jurisdictional authority.” (pg. 133).
- **Year-Round Transportation:**
 - The WCGP supports an “enhanced year-round transit service to and within the Wasatch Canyon.” (pg. 129).
- **Development of the canyon related guiding principles:**
 - “System: Protect and steward open lands and natural resources (air, water, wildlife, fisheries, climate, trail systems, wetlands, dark skies, soundscape, soils, open space, and native vegetation).
 - Open Space: Promote the acquisition of natural and undeveloped lands for conservation.
 - Water: Protect, maintain, and improve watershed health, water supply, and water quality.
 - Air: Protect and improve air quality for protection of public health, environmental health, and scenic visibility.
 - Native Species: Maintain healthy populations of native species and support early detection and rapid response to eliminate invasive species and noxious weeds.
 - Wildlife: Preserve sensitive habitats and migration areas for wildlife.” (pg. 31).

- **All Canyon Policies:** “SLCo supports mixed-use mobility centers, which should be located outside the canyons, but within short distances. Mobility centers uses should include transit, parking, daily services and be near or mixed in with residential dwellings and businesses.
 - The County supports rideshare parking, bus stops and electrical vehicle charging at key nodes.
 - The County supports increased transit frequency at key locations throughout the Canyons.
 - The County supports year-round transit service within the Cottonwood Canyons and to Park City.
 - The County supports carpooling programs.
 - The County supports roadway design that increases mobility.
 - The County supports integration of active transportation planning in the canyons.
 - The County supports the appropriate use of Best Management Practices (BMPs) when addressing stormwater impacts to the watershed and water quality.” (pg. 123).
- **All Canyon Strategies:**
 - “The County will assist in developing parking structures for the purpose of Canyon transit and carpooling.
 - The County will ensure that new and enhanced transit facilities and operations are designed to avoid degradation of watershed health and water quality.” (pg. 129).
- **Little Cottonwood Canyon Policies:**
 - “The County supports an eastbound or uphill bicycle lane and a westbound or downhill shared use lane. Active transportation planning should include proper pavement markings and signage to meet needs of both people biking and driving. The westbound lane of travel should be wide enough to accommodate bicyclists passing each other where appropriate.” (pg. 129).

Again, we appreciate the efforts that UDOT and its partners devoted to the compilation of the Report. We look forward to continuing the conversation on these important issues, particularly upon receipt of additional information and specific data on impacts.

Sincerely,

Jenny Wilson, Mayor
Salt Lake County

Friends of Alta

PO Box 8126
Alta, UT 84092

Kyle Maynard, Executive Director
(801) 742-9719

www.friendsofalta.org

UDOT EIS Team,

Friends of Alta is Alta's only 501(c)(3) land trust and environmental nonprofit. Since 1982, we have devoted ourselves to the mission of protecting the **environment and watershed** of Alta and the Albion Basin in Little Cottonwood Canyon (LCC). Below are our thoughts, concerns, and suggestions pertaining to the Little Cottonwood Canyon EIS' *Draft Alternatives Development and Screening Report (EIS)*.

OVERVIEW

Friends of Alta (FOA) has advocated for improved bus travel since the days of Mountain Accord (2013). Our belief is that the infrastructure already exists to improve bus travel, the technology exists within the city to accommodate regional transit systems, and the cost to implement is ultimately less than the gondola. Hence, FOA fully supports the Enhanced Bus Option with the Peak Period Shoulder Lane (PPSL), along with associated projects. While we have environmental concerns regarding: the widening of the road; the introduction of snowsheds; and widening of trailhead parking lots which will need to be addressed in the next step of this process, we feel that this alternative has the potential to do the best job of using the existing infrastructure, being affordable, improving reliability, mobility, and safety without significantly burdening the environment, watershed, and viewshed that we all depend upon.

Below, FOA will specify our thoughts and concerns regarding the respective proposed alternatives. However, with all of these alternatives, we believe that the EIS is still flawed without a capacity study to determine how many people can safely be in LCC without creating irreparable damage to the environment and watershed. This capacity study must be conducted as part of the *indirect and cumulative impacts* in the EIS.

SCREENING CRITERIA

While we understand the rationale of the current Level 1 criteria of: mobility, reliability, and safety, we have significant worries about the tone and intention set behind projects in regard to the environment.

Unlike most road projects where the goal is to move as many people efficiently and safely as possible from point A to point B with the added benefit of economic development, these alternatives are intended to move then return people from the city to a vital and sensitive watershed.

The mission of Friends of Alta is to protect the environment of Alta, including watershed and wildlife habitat areas; to preserve Alta's unique character and heritage; and to encourage stewardship and sustainability of Alta's environment and community.

Their sole purpose in visiting this watershed and forest is to recreate and enjoy the natural beauty and landscape of this magnificent canyon. Similar to our partners, notably Salt Lake City Public Utilities, we feel that the impacts to the watershed and environs of LCC should have been a Level 1 Screening Criteria due to the importance of minimizing the impacts of transit and large crowds.

While the screening criteria has been settled, it is still important that UDOT address concerns surrounding the watershed. Specifically, we would like to know what differences there would be to the alternatives, if any, if watershed and environmental impacts had been used as a Level 1 screening criteria.

WIDENING OF WASATCH BLVD

Because the alternatives to widen Wasatch Blvd from Fort Union to the mouth of Little Cottonwood Canyon are in all three (3) transit alternatives, it is more efficient to discuss this separately.

The widening of the road is a substantial concern of our supporters and citizens from Cottonwood Heights because it substantially influences the ability for more visitors to access an already taxed ecosystem in the canyons, and creates a more hazardous environment for both drivers and pedestrians in neighborhoods along Wasatch Blvd. Of the two options, the Imbalanced Lane Alternative is preferred over the Five-Lane Alternative. North bound traffic is far less of an issue during any time of day, and any traffic benefits far outweighed by the community concern of wider, not pedestrian friendly, thoroughfares that serve only to increase traffic in this quiet community. Furthermore, the Five-Lane Alternative would require more construction and impermeable surface than the Imbalanced Lane Alternative. Therefore, Friends of Alta supports the Imbalanced Lane Alternative on Wasatch Blvd.

That said, we fear that without additional enforcement – prohibiting cars from lining up when S.R. 210 is closed and accommodating priority bus lanes – we will see only minimal improvement (regardless of any road improvements on Wasatch Blvd).

ENHANCED BUS TRAVEL WITH NO ROAD WIDENING

The Enhanced Bus Travel with no road widening in LCC largely looks to solve our traffic woes through 12 buses each from two (2) different mobility hubs – one at 9400 South and the other at the Gravel Pit next to Big Cottonwood Canyon. Buses would be required to travel along the widened Wasatch Blvd and ultimately into the same line of cars travelling up S.R. 210. This, is the fatal flaw of this alternative.

No one will disagree that we need more buses, but there is a greater need to get more passengers on buses. In all three alternatives, UDOT proposes that the majority of visitors to the canyon will still use personal vehicles, thus there will be a lack of “mandatory” of mass transit. Therefore, UDOT will rely upon incentives to get people out of their cars and onto mass transit.

Incentives are crucial to any of the projects to succeed. Hence, while more passengers can travel via bus, the fact they will be stuck in traffic just as they would in their car is the single biggest deterrent to mass transit that exists currently and in this transit alternative. Because of this flaw, we believe this proposed alternative would fail.

ENHANCED BUS TRAVEL WITH ROAD WIDENING

As stated in the “Overview” section, FOA supports the Enhanced Bus with PPSL Alternative. In our view, this alternative accomplishes the goal set out by UDOT while causing the least potential harm to the watershed and maintains the infrastructure to service the whole canyon, not just the ski resorts. We would like to know what the AHI level and number of road closure days would be without snowsheds. Snowsheds account for the cost difference between the Gondola and this alternative, in addition to snowsheds only saving us five (5) road closures days per season. It is necessary to provide details on a scenario entailing Enhanced Bus with PPSL but without snowsheds.

Additionally, FOA has environmental concerns regarding both the snowsheds and the widening of the shoulder and would like UDOT to include preliminary environmental impacts that accompany the amount of earth moving that would be necessary for each snowshed. While both are common practice elsewhere, LCC is anything but common and extra consideration should be given to how the snow shed and added shoulder lane would impact water runoff. Our goal is to protect the watershed and improve water collections in LCC. The watershed provides approx. 15% of Salt Lake City’s culinary drinking water and 30% of Sandy’s culinary drinking water. We suggest that UDOT capture the opportunity to provide much needed public works system improvements along highway 210, like storm drain systems and other water management collection improvements. While an Enhanced Bus system and roadway improvements are provided by UDOT along highway 210, we strongly recommend the thoughtful consideration and input from expert civil engineers to plan an adequate storm drain system. Providing a storm drain system should increase the safety and wellbeing of travelers along Highway 210, improved water collections for Salt Lake County residents and merits a much higher priority on UDOT’s planning of the enhanced roadway.

Other projects that are “tied” to this alternative involve trailhead parking; parking restrictions; and the construction of mobility hubs. The parking issues in the canyons are a continuing source of disagreement and revolve largely around the ski areas themselves in the winter. While roadside parking below snowbird can be considered a problem (and PPSLs there would not be a shoulder for cars to park on) the larger issue is roadside parking at Alta and Snowbird. The biggest issues to parking restrictions are: singling out the backcountry community who have nowhere else to park, and enforcement. Without more answers and solutions to these issues, it is hard to see how a roadside parking ban below Snowbird would be successful.

In regard to the mobility hubs, the Enhanced Bus Alternatives propose the construction of two mobility hubs. We feel this is a great option as it provides convenient (and thus attractive) parking options for mass transit for both those downtown and those in Draper/Sandy/Provo and should be considered for all alternatives.

GONDOLA

The gondola option offers the most novelty and potential to attract tourists. This is how the gondola option has been described by the UDOT team in every public meeting. However, “potential tourist attraction” cannot be considered as a benefit that separates it from the other projects based on the NEPA *Purpose and Need* parameters set earlier in this process. To consider “tourist attraction” or “theme park ride” as a benefit and factor worth consideration would be highly inappropriate by NEPA standards to say the least and must not be used when weighing whether the gondola alternative is superior to the bus alternatives. Based on statements made by the EIS Team in public meetings, it sounds like the gondola’s potential to be a “tourist attraction” is a factor that is being weighed in this analysis, and in fact is already biasing the public comments because these statements were made in public meetings soliciting public comments. This violates NEPA. If UDOT wishes to include this factor, it will need to return to the Purpose and Need phase.

The gondola alternative ultimately fails because the proposed alignment requires potential passengers to change modes of transportation three times [personal car to bus to gondola] and drivers would still be stuck in traffic getting to the gondola. UDOT, itself, has identified this number of mode changes to be a deterrent to mass transit use, which in this situation where UDOT is relying very heavily on incentivized ridership (*see above statement on incentives*), an added deterrent would negate any potential positive impact the gondola would have on the road. The McCandless Gondola Alignment which proposes the mobility hub and base station be located next to LaCaille Restaurant would solve this issue of too many transit modes, but it still encounters problems described below, notably the limited users who can ride the gondola, its exclusion of any viable use except to access ski areas, and increased risk to proposed 2,000/hr visitors on road due to 22 road closure days (signifying less avalanche mitigation), and significant impact to the viewshed.

A question must be raised here that applies to prior paragraphs as well – was the goal of 1000 passengers per hour a measure of feasibility or the actual plan on how to use the gondola? While there are mixed opinions about the gondola, all seem to agree that using the gondola as a “pressure release valve” for the road is foolhardy, especially at its great expense to taxpayers. All proposed mass transit options have the ability to greatly reduce the number of cars on the road and negate the need for more parking. The current proposed 2:1 passenger ration (cars to mass transit), we fear, will ultimately not lead to enough improvement. We will still see traffic, though it may move a little quicker, and we will still have fights over adding additional parking to an extremely sensitive and vital watershed.

Next, we would like the EIS Team to clarify its math for the 30th busiest day and how many passengers need to ride mass transit. In all alternatives, approximately 1,000 passengers will ride mass transit per hour and approximately 2,000 passengers will ride in cars up S.R 210, totally 3,000 people moving up the canyon per hour. However, on pg 84 of the Alternatives Refinement document, UDOT states that there will be 11,300 cars in the canyon at peak times if there is no action. This is approximately 20,340 visitors if we assume there are 1.8 passengers per car. Here is the disconnect. How will 3,000 persons per hour meet the need for 20,340 peak visitors? Even on the 30th busiest day, there would likely be more than 15,000 visitors in the canyon. Where we feel the math fails is in accounting for the fact that most visitors are traveling up the canyon in a four (4) hour window, not throughout the day. By the current math, only 3,000 visitors will arrive at ski areas by mass transit leaving the remaining 17,340 to arrive via S.R. 210 in a four (4) hour window. No amount of incentive travel or traffic management will mitigate this. Only restricted travel and forced mass transit can help. We ask that UDOT revisit the numbers and estimation and please correct where we have erred in this assessment.

Lastly, the gondola alternative does not include roadway improvements or snowsheds. The result of this is increasing the number of road closure days from approx. 10.5 to 21. While it is easy to say “well the gondola will function when the road is closed”, this completely ignores UDOT’s travel goals of having 2000 passengers per hour on the road, and it ignores the public use of the canyons – restricting access for hikers, backcountry skiers, and other non-ski area visitors, but catering to those who paid to access public, privately owned ski areas on Federal land. This seems to be an inappropriate system to access public lands, even if some of those lands are leased to privately owned ski companies. For the State and UDOT to be using taxpayer dollars for a transit system that so disproportionately favors two privately owned business appears to be a violation of the public trust and fiduciary duty. Specifically, the gondola makes it more difficult for all non-ski area visitors to visit LCC because there will have increased road closure days and limiting of cars in the canyon. This must be revised by (1) adding more gondola stops; (2) adding snowsheds to the gondola project; or (3) eliminating the gondola alternative all together.

In summary, FOA supports the Enhanced Bus with PPSL Alternative, but we have a couple of questions and concerns that UDOT should address in a new draft of the *Alternatives Development and Screening Report*:

- **Why does a gondola option not include snowsheds and two (2) mobility hubs?** With the proposed number of visitors travelling the road in the gondola option, snowsheds should be included. Two (2) mobility hubs would better accommodate the Draper/Sandy/Provo skiers.
- **What options would be eliminated if watershed health was considered in level 1 screening?** The LCC watershed contributes a significant portion of the cities culinary water. We must protect it, and, as a result, there must be a cumulative impact study on visitors to the greater watershed.

- **Is the 1000-person goal on mass transit a number used for feasibility or is that an amount we should expect to see use mass transit in practice?** FOA feels we should strive to reduce as many cars as possible on the road while not overwhelming the environment with visitors. Relying on incentives and traffic management may not be enough.
- **What enforcement plans does UDOT have to enforce roadside parking restrictions, and will UDOT consider restricting roadside parking at the ski areas, where the most volume of roadside parking exists?**
- **What is the AHI of LCC with no snowsheds if more than 1000 passengers ride mass transit and traffic congestion is significantly reduced?**

Thank you,

Kyle Maynard

Little Cottonwood Canyon EIS Public Comment

I support the gondola option with a base station at LaCaille as the best transportation solution for Little Cottonwood Canyon.

I like the idea of having multiple transportation options within the canyon.

Name: David Kevin Twitchell
Date: 6/28/20

Little Cottonwood Canyon EIS Public Comment

I support the gondola option with a base station at LaCaille as the best transportation solution for Little Cottonwood Canyon.

The traffic up with cottonwood Canyon is out of control. It would be nice to have other options available.

Name: Amy B. Nelson
Date: 6.28.20

Little Cottonwood Canyon EIS Public Comment

I support the gondola option with a base station at LaCaille as the best transportation solution for Little Cottonwood Canyon.

The gondola is a cost-effective way to tackle problems we've been trying to solve for years. Please choose the gondola!

Name: Zach Nelson
Date: 6/28/20

Little Cottonwood Canyon EIS Public Comment

I support the gondola option with a base station at LaCaille as the best transportation solution for Little Cottonwood Canyon.

Traffic is too bad as it is and the gondola will help while being environmental friendly option so the nature will not have to suffer our choice to entertain ourselves at the canyon.

***This 'appeal' regarding
Little Cottonwood Project
from
Dave Brough
D.A.V.E.
(Dual Mode Vehicular Endeavor)***

“(A) commenter provided a new concept to UDOT called the Dual-mode Advanced Vehicular Endeavor, or D.A.V.E. D.A.V.E. does not meet the logistical, technological, or economic requirements for a reasonable or practicable Little Cottonwood Canyon alternative.”

From Draft Alternatives Development and Screening Report P 53

The 'commenter' submits that every mention about DAVE and dual-mode is false and/or misleading.

The 'commenter' hereby appeals the decision to eliminate dual-mode DAVE from the list of alternatives for the Little Cottonwood Canyon Project.

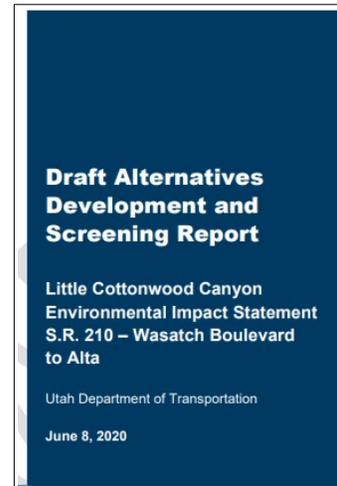

Commenter submits that UDOT knew or ought to have known that there were several examples of dual-mode in service and / or commercially available. Furthermore, the technology involved in dual-mode is easily and cheaply replicated.

It is submitted that the conduct and failure of UDOT to recommend dual-mode, a technology that is easily and cheaply enacted, constitutes a fraud upon the people.

Dave Brough
July 10, 2020
davebrough@gmail.com

This appeal is based upon the UDOT evaluation taken from the project website dated June 20/20 at p. 53 (site comments shown in italic-bold):

https://littlecottonwoodeis.udot.utah.gov/wp-content/uploads/2020/06/LCC-EIS-Alternative-Screening-Report-2020-05-21-Main_Body.pdf

Finally, a commenter provided a new concept to UDOT called the Dual-mode Advanced Vehicular Endeavor, or D.A.V.E. This system uses an ordinary automobile (or light truck) adapted with a mounting device so that it can drive on the street network and then be picked up by a fixed guideway and travel above ground. Based on an internet search and a review of transportation and transit resources, UDOT did not find any examples where a D.A.V.E. concept has been implemented. The idea of dual-mode vehicles (that can operate on either roads or fixed guideways) has been previously discussed among various transit agencies, but UDOT could not find any examples where either dual-mode transit vehicles or dual-mode personal automobiles have been installed operationally. UDOT determined that the D.A.V.E concept would require a technology that does not currently exist and is not commercially or institutionally available.

Additionally, the D.A.V.E. concept would require users to either purchase new vehicles that could be used on the D.A.V.E. guideway system or purchase equipment that would allow their personal vehicles to be used with the D.A.V.E. guideway system. Neither the new vehicles nor the modification equipment are commercially available. Even if it were available, the State of Utah could not require drivers to purchase the vehicles or equipment to use the D.A.V.E. system. Because a commercially available product is not available, designing a D.A.V.E. alternative for the S.R. 210 Project would require an extensive and costly research and development process. For these reasons, the D.A.V.E. concept does not meet the logistical, technological, or economic requirements for a reasonable or practicable Little Cottonwood Canyon alternative.

“D.A.V.E. ...uses an ordinary automobile (or light truck) adapted with a mounting device so that it can drive on the street network and then be picked up by a fixed guideway and travel above ground.

UDOT did not find any examples where a D.A.V.E. concept has been implemented.”

UDOT was remiss in its search. There are several of examples of dual-mode

At right is a dual-mode rail maintenance vehicle - an every-day sight along rail lines.

Elon Musk’s Boring Company uses a ‘kerb wheel’ similar to that as used on dual-mode buses, which have been in use in UK, Germany and elsewhere for years. In this configuration it is known as ‘guided’ bus.

https://en.wikipedia.org/wiki/Guided_bus

(Photo: Tom Cross/Teslarati)

Here it is in Adelaide, Australia (right).

In this video, note the high-speed transfer from road to guideway at 00:32

<https://www.youtube.com/watch?v=X89WSVjyBRw>

The kerb guide wheel of a guided bus in Mannheim, Germany

“UDOT could not find any examples where either dual-mode transit vehicles or dual-mode personal automobiles have been installed operationally.”

Per the above, clearly not so!

“UDOT determined that the D.A.V.E concept would require a technology that does not currently exist and is not commercially or institutionally available.”

And yet again, clearly not the case. The technology exists and is currently available.

“Additionally, the D.A.V.E. concept would require users to either purchase new vehicles that could be used on the D.A.V.E. guideway system or purchase equipment that would allow their personal vehicles to be used with the D.A.V.E. guideway system.

New vehicles not required.

As for cost (over and above the vehicle), Elon Musk recently claimed that “a set of guide wheels to steer self-driving vehicles would cost \$200 to \$300, and would convert any electric car into a “rail-guided train”.

As for the vehicles, even if new, the cost would pale compared to gondola (measured in the tens of millions) or bus.

The cost of guideway would run about \$2 million/mile. With portals, perhaps \$20 million for the 8-mile system.

Furthermore, all vehicles used in DAVE will have federal safety ratings. Transit buses (over 16,000 lbs) have no crash-worthiness standards (right is an example what happens when a conventional transit bus meets a conventional train (or cement truck).

“Neither the new vehicles nor the modification equipment are commercially available.
Again, not true. (Ask any railroad). Furthermore, it is easily manufactured.

“Even if it were available, the State of Utah could not require drivers to purchase the vehicles or equipment to use the D.A.V.E. system.

Because...?

Where is that ‘in law’? We suggest that it is not.

We also suggest that there would be incentives for individuals and companies to purchase such vehicles because they would attract customers (see SLC International scenario)

“Because a commercially available product is not available,
As above, commercially available product is available.

“...designing a D.A.V.E. alternative for the S.R. 210 Project would require an extensive and costly research and development process.

Hardly extensive of expensive. Besides it would make an ideal project for BYU,
https://www.heraldextra.com/news/local/education/college/byu/byu-professor-constructs-mini-town-to-test-self-driving-car/article_1be64be4-2731-5fc5-8acf-6397a18d9077.html

...or Utah State University...

**New Electrified Transportation Research Center Opens at
USU**

and others, for which grants (such as TIGER) are readily available.

“...the D.A.V.E. concept does not meet the logistical, technological, or economic requirements for a reasonable or practicable Little Cottonwood Canyon alternative.

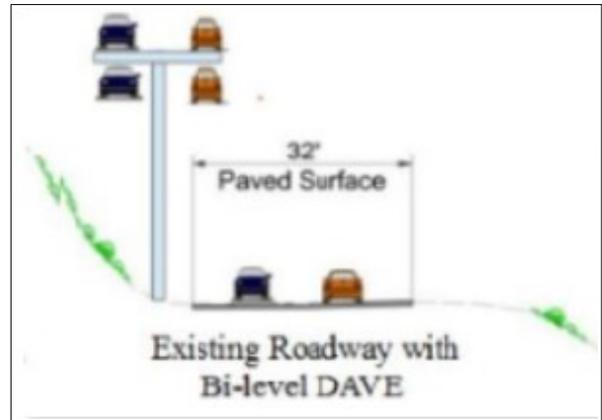

On the contrary, DAVE **does** meet the logistical, technological, or economic requirements for a reasonable or practicable Little Cottonwood Canyon alternative.

Enter COVID-19

COVID changes everything. Gondola and/or bus up Little Cottonwood Canyon is now DBD (Dead Before Departure). The future of transportation does not include bus, gondola, or any other form where people are placed in close proximity or where the concept does not provide for door-to-door mobility.

In short, the Little Cottonwood Project must be jump-started from ‘0’.

This 'over-under' guideway drawing (right) shows an 'ultimate' version of dual mode as suggested for Little Cottonwood Canyon.

About DAVE:

DAVE guideway costs about \$2 million per mile.

DAVE vehicles will travel at 60 - 80 mph on guideway, this resulting in the 8-mile trip to Alta taking but 8 minutes. Allowing for 2 minutes for deboarding and boarding, say 20 minutes or 3 trips per hour per vehicle from the portal at bottom of canyon.

Vehicles can either travel separately (at .5 second spacing) or in trains of a dozen or more.

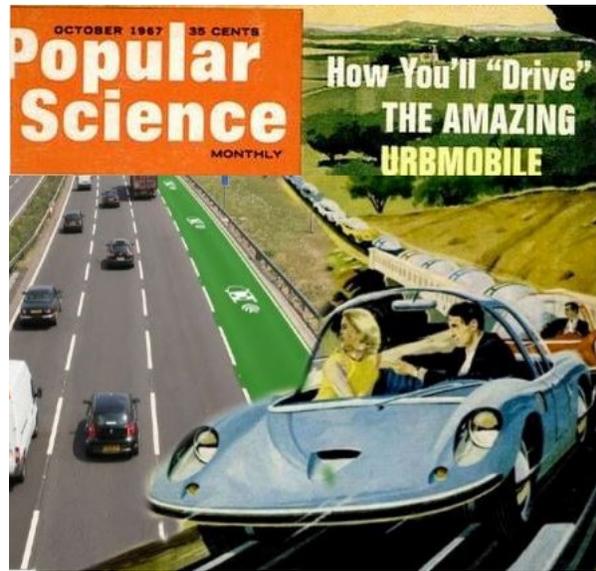

Maintenance by Pepboys-etc.

Dave Brough with rendering of DAVE
(Dual-mode Autonomous Vehicular Endeavor)
traversing Farmington Bay wetlands

This Popular Science article provides an excellent insight into a dual-mode concept called “Urbmobile”.

<https://books.google.com/books?id=1SoDAAAAMBAJ&pg=PA208&lpg=PA208&dq=the+amazing+urbmobile&source=bl&ots=pBEXgLETU6&sig=ACfU3U3ToPsrFIb8i6sm9-TQCQc49mHcxQ&hl=en&sa=X&ved=2ahUKEwiPyufc88PqAhXyJDQIHfkjAHQQ6AEwAnoECAgQAQ#v=onepage&q=the%20amazing%20urbmobile&f=false>

Example scenario. 4.5 million skiers fly into Salt Lake City International every year. They all have to then make their way to a destination resort. In this scenario, a DAVE'd Uber would pick customer up at the RideShare and transport them and bags straight to the resort's check-in at Alta.

Total distance: 32 miles (24 on conventional roads; 8 on DAVE)

Total time: 32 minutes

Satisfaction: Total

* Dual-Mode vehicles can travel both on conventional roads and on guideways and seamlessly switch between one and the other.

Gondola is

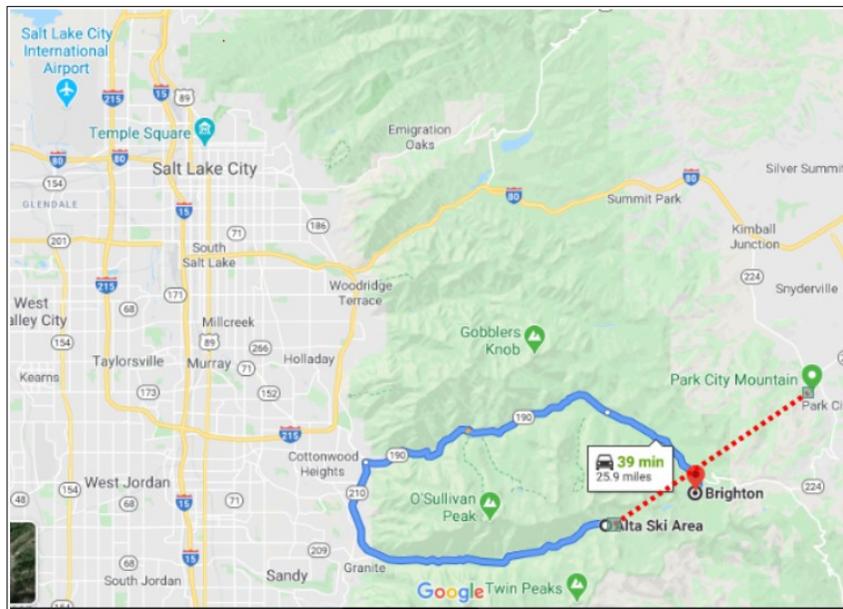

- too slow
- too expensive
- too crowded

Bus is

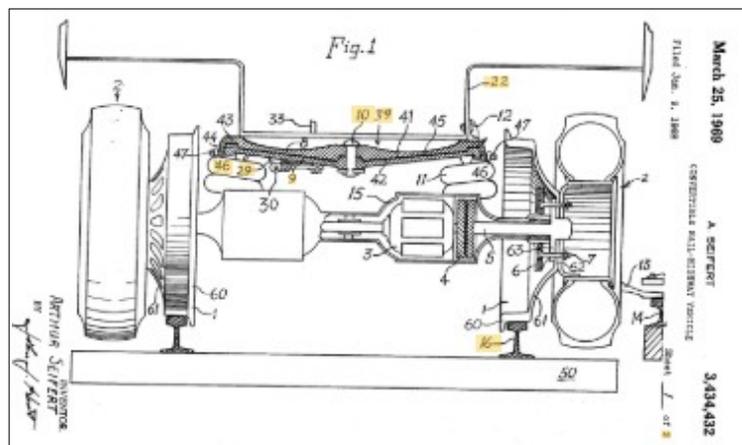

- too crowded
- too expensive
- environmentally distasteful

The ideal product should be

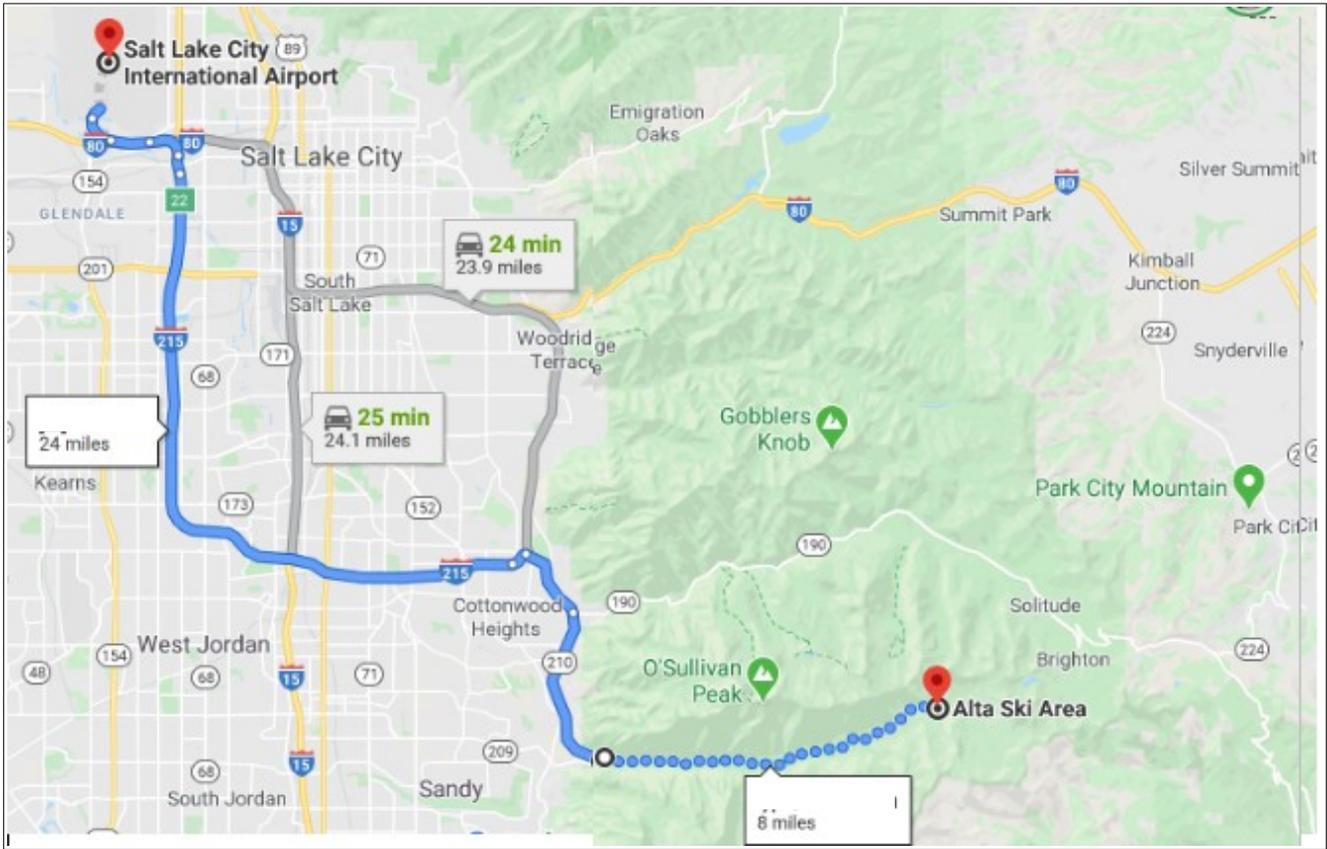

- inexpensive
- ultra-safe
- station-free
- schedule-free (24/7/365)
- easily maintained
- seamless (non-stop)
- connected to Brighton and Park City
- personal (no ride-sharing with strangers)
- privately O&O'd

**A 'complete' Dual-mode System
 Guideway up both Big Cottonwood and Little
 Cottonwood Canyons as well as cross-country link to
 Park City.
 All at a fraction of the cost of any of the three
 alternatives advanced to the 'final'**

FRODE JENSEN

PARK CITY UT 84060

July 10, 2020

Little Cottonwood Canyon EIS
c/o HDR
2825 E Cottonwood Parkway, Suite 200
Salt Lake City, UT 84121

Re: Little Cottonwood Canyon Environmental Impact Statement (EIS) dated June 8, 2020

Ladies and Gentlemen:

I reside in Park City and often travel on State Route (SR) 210. I also research and write about questions of transportation sustainability in Utah and am most interested in and deeply concerned about the development of long-range plans for the critically important Central Wasatch resort and recreation area and adjacent population areas which are sustainable and which are both economically sensible and enhance our quality of life.

I have reviewed the EIS assessing transportation needs for the SR 210 Project extending from the intersection of SR 210 with SR 190/Fort Union Boulevard in Cottonwood Heights to its terminus in the town of Alta.

I applaud and appreciate the huge amount of work that has gone into the report. Nevertheless, I am concerned that the report is insufficiently broad in scope and fails to adequately address the impending significant increases in traffic congestion leading to all our Central Wasatch resorts. In particular, I believe it gives insufficient consideration to possible alternative integrated transportation system solutions involving public transit, inter-resort connections and road tolling.

I have the following comments which I hope you will carefully consider. I admit that I have not been able to read the entire report and if some of the comments I make in this letter have already been covered in the report, I apologize in advance.

1. Total Cost

- a. Depending on the alternative chosen the project will cost, just to build, at least nearly \$300 million to as much as nearly \$400 million. And that's just to build it. Annual operating costs are estimated to run from \$6 to \$9 million a year.
- b. Before spending this substantial amount of taxpayer money, UDOT needs to assure interested persons and the public that they have developed a sustainable transportation plan that addresses projected travel throughout the Central Wasatch; that they have thought of everything and that all questions have been answered.
- c. In particular, the public needs to be assured that there aren't better, cheaper, more integrated, and more efficient ways to solve the various transportation problems presented by the currently existing and projected congestion issue on SR 210.

2. Scope of Project

- a. The defined scope of this assessment appears to be far too narrow. While there is no question that levels of traffic on SR 210 and the projected growth in those levels are not sustainable given current systems and policies, the solution must include consideration of all of the inter-related transportation planning needs in Greater Salt Lake City and the whole Central Wasatch recreational area.
- b. The report (p. 27) contemplates stunning population growth of over 1,000,000 residents in Salt Lake and Utah Counties in just the next thirty years. The Wasatch Front Regional Council (WFRC) estimates that, without proper forethought and planning, average auto travel times will grow approximately 71 percent by 2050 in the WFRC region. The population growth projection does not include growth in the counties north of Salt Lake or in Summit and Wasatch Counties on the Wasatch Back. Nor does it project increased visitor levels for the six existing Central Wasatch mountain resorts (Alta, Brighton, Deer Valley, Park City, Snowbird and Brighton).
- c. All six Central Wasatch mountain resorts are currently suffering from significant traffic congestion problems which will increase substantially in the future based on projected increases in population and tourism. A seventh resort, Mayflower, is in development.

- d. The base areas for all seven mountain resorts served by State Routes 189, 190, 210, 224 and 248 are very close together. They are all within 10 miles or less from each other on a straight line. They serve a large and overlapping population of residents and visitors. However, a person driving a car from the base of Deer Valley to the base of Alta would travel over 50 highway miles. During the winter, many people make all or a portion of that drive between and among all six resorts and Salt Lake City every day.
- e. No imagined solution to the congestion problem on SR 210 will be successful without addressing congestion on SR 190 as well as SR 210, as well as on the other routes providing access to the resorts: I-80 between Salt Lake City and Park City and SR 224 and 248 in Park City. In light of the development of the Mayflower resort north of Heber City, planners should also consider likely increased traffic and congestion on SR 189 between Park City and Heber City. For any solution to be effective it must be integrated and address congestion on all the affected highways.
- f. I would submit that the Transportation Governance Amendments passed by the Legislature in 2018 mandate that UDOT and the Transportation Commission consider all of the inter-related and multi-modal implications in any project of this size before moving forward.

3. Mode Options

- a. I applaud UDOT for proposing solutions to traffic congestion on SR 210 which will have the effect of reducing private automobile use on the highway between the base of Little Cottonwood Canyon and Alta resort.
- b. I am concerned, however, that the proposed roadway capacity expansion on Wasatch Boulevard between Fort Union Boulevard and the base of Little Cottonwood Canyon will simply lead to more private automobile use on Wasatch Boulevard and, ultimately, more (and not less) traffic congestion on this part of SR 210. I believe UDOT's arguments that the area is insufficiently densely populated to support improved mass transit will be a self-fulfilling prophecy until it is too late: when automobile traffic has choked Wasatch Boulevard. I recommend studying the use of a combination of road tolling and improved public transit now to avoid the need for and cost of extensive roadway capacity expansion.
- c. Regarding whether congestion on SR 210 between the base of Little Cottonwood Canyon and Alta resort is better addressed by building a bus or a gondola system, I strongly prefer a gondola system which I believe would be

aesthetically pleasing, more weather resilient and would reduce motor traffic on SR 210. Additional lanes on SR 210 will inevitably increase automobile volumes. A gondola would enhance the ambience of the travel experience for residents and visitors alike. Ideally, a gondola system would be a drawing card for visitors, improving not only sustainable transportation but also tourism. But I do also believe overall affordability (both in terms of construction cost and operating cost and in light of other possible alternatives) is a very important consideration.

4. Multi-modal Integration and Public Transit Improvement

- a. Neither the bus-related proposals nor the gondola proposal for SR 210 appears to be substantially integrated with other means of public transportation. All of the solutions assume that travelers will drive private automobiles to the base of the new system where a 2,100 space parking garage will be built. The proposal does not consider the inevitable increased congestion in the vicinity of the base of any new system. Why will the congestion at the base be any less than it is today driving up the canyon or in the resort parking lots?
- b. Planners should consider how to meaningfully and optimally connect the new system to the existing UTA public transportation system. For example, the existing Red and Blue Trax lines and the FrontRunner all stop at Murray Central Station, as do currently at least five UTA bus routes. Planners should consider a multi-modal and integrated system (light rail, monorail, bus and/or gondola) with a hub at at Murray Central Station connecting Murray Central (and/or another convenient TRAX station or stations), Wasatch Boulevard, both SR 190 and 210, and the four Cottonwood resorts, so that travelers from throughout the Wasatch Front can access the resorts (and travel between the resorts) by public transit without using an automobile.
- c. As part of the overall solution to traffic congestion problems, planners should also consider a multi-modal and integrated system (light rail or bus) connecting Salt Lake City and Park City. Ideally, this system would connect to existing TRAX and FrontRunner service and run between SLC airport and a transportation hub in Park City which connects by bus, gondola or monorail) to Park City and Deer Valley mountain resorts. Visitors to the Greater Salt Lake City area arriving at the airport should be strongly encouraged to use public transit and not private automobiles by use of a combination of road toll charges and improved public transit throughout the area.
- d. Instead of (or in addition to) a bus or gondola system on SR 210, planners should consider whether a bus or gondola system on SR 190 from the

intersection of Fort Union Boulevard and Wasatch Boulevard to Brighton/Solitude would be superior to a bus or gondola system on SR 210. Regardless of whether the bus or gondola system is built on SR 190 or SR 210 (or both), planners should consider connecting Brighton/Solitude to Alta/Snowbird by a road/tunnel bus or light rail system and/or gondola. An (environmentally sensitive) connection between Brighton/Solitude and Alta/Snowbird would certainly reduce automobile volumes on both SR 190 and SR 210.

5. Resort Interconnections

- a. A significant amount of existing traffic congestion on State Routes 189, 190, 210, 224 and 248 is generated by travel between and among Salt Lake City and the six resorts. If automobile travel between the existing resorts can be reduced by building multi-modal connections between the resorts, the overall cost to taxpayers of transportation infrastructure improvements can be reduced.
- b. The resorts have proposed a ski lift interconnect which they call OneWasatch to facilitate access to, and travel between, the six resorts.
- c. The OneWasatch interconnect can be easily accomplished (i) by connecting Park City resort and Deer Valley resort by gate where their properties abut, (ii) by connecting Park City resort and Brighton/Solitude by road/tunnel and/or gondola and (iii) by connecting Brighton/Solitude to Alta/Snowbird by road/tunnel and/or gondola. Proposals for all three interconnections have been made repeatedly in the past and are very feasible.
- d. Many skiers and other resort users currently travel daily between Greater Salt Lake City, Park City, Heber City and the resorts by automobile. Completing the OneWasatch interconnect will take thousands of cars off the road during the ski season since skiers will be able to access all six resorts by simply travelling to the resort base nearest to them.
- e. While Park City resort and Brighton/Solitude can easily be connected by gondola or chairlift, planners should also consider connecting Park City resort and Brighton/Solitude by bus or light rail via a tunnel. A tunnel between Park City and Brighton/Solitude would allow visitors staying in Park City (whether skiing or not) to access the Brighton/Solitude resorts more easily and vice versa without using the highways.

- f. I urge UDOT to work with the resorts to make the OneWasatch interconnect a reality and an important part of an integrated multi-modal transportation plan for the Central Wasatch.

6. Roadway Tolling

- a. In 2018 the Utah legislature adopted an updated road tolling statute which permits the imposition of tolls on existing state highways. Road tolling can be a key to transportation sustainability because it uses economic incentives (as opposed to roadway capacity expansion) to mitigate congestion.
- b. Planners should consider electronic tolling on highly congested portions of State Routes 189, 190, 210, 224 and 248. These tolls can be varied in amount depending on the time of day and level of congestion. The EIS encourages the adoption of “[t]olling or other management strategies such as no single-occupant vehicles during peak periods” to further mitigate congestion. I support this option and would ask UDOT to engage in further study to see how tolling could be used not only to avoid or minimize roadway capacity expansion and to reduce congestion on state highways but also to pay for a large portion of the improvements to public transit suggested in this letter.

Thank you very much for the opportunity to have participated in the project approval process.

Sincerely,

Frode Jensen

RE: Salt Lake Climbers Alliance Comments to UDOT's Little Cottonwood Canyon Environmental Impact Statement Draft Alternatives Development and Screening Report

UDOT Planners:

The Salt Lake Climbers Alliance (SLCA) appreciates the opportunity to provide input to UDOT's Little Cottonwood Canyon Environmental Impact Statement Draft Alternatives Development and Screening Report. The SLCA provided comments during the scoping period on June 14th, 2019 and has had two site visits with UDOT planners to the LCC climbing resource.

About the SLCA

The Salt Lake Climbers Alliance is the local climbing advocacy 501(c)(3) non-profit in and around Salt Lake City, Utah. The mission of the Salt Lake Climbers Alliance is to serve as the unified voice of all climbers in the greater Wasatch region, engaging as an advocate to protect outdoor climbing access and as a steward to maintain sustainable climbing resources in the Wasatch and surrounding regions. SaltLakeClimbers.org

The SLCA supports the Alternative of Enhanced Bus and no additional roadside capacity, with caveats (#1-14 below), as this Alternative would have the least impact on the climbing resource with the information currently provided by UDOT.

Overall, any Alternative needs to carefully consider dispersed recreation, especially in the lower part of Little Cottonwood Canyon. The climbing areas in the lower portion of the canyon are heavily used throughout the year and the Alternatives will potentially negatively affect the user opportunities, user experience, and environment.

The SLCA has invested heavily into the recreation infrastructure in the canyon via hundreds of thousands of dollars in a sustainable trail system that spans both USFS and private land. The potential impact to this trail system needs to be analyzed. Further, there must be analysis of the

visual and auditory impacts to the climbing and bouldering resources that are in close proximity to the roadside. Finally, UDOT should analyze the loss of these resources due to road widening, road re-configurations, and/or gondola infrastructure.

SLCA recognizes that the removal of roadside parking along the highway increases safety and has responded by working to formalize trails and increase connectivity from centralized parking and access points such as the Little Cottonwood Canyon Park & Ride, Gate Buttress and the Grit Mill parking lots. However, during the winter months these parking lots are not available to climbers because they are full (skiers), closed, or unplowed. As such, roadside parking is utilized. UDOT must analyze how the elimination of roadside parking during the winter months will impact climber access.

In addition, the EIS must also include substantive analysis on the following:

1. Analysis of current and future dispersed recreation usage, transportation and parking needs in the whole of the canyon during all times of the year, spring, summer, fall, and winter. Dispersed recreation areas including, but not limited to the lower LCC Park & Ride, Grit Mill, Gate Buttress, Coalpit, Y-Couloirs, Tanners, Mt. Superior, and Hellgate.
2. Analysis of impacts contributing to anthropogenic climate change.
3. Analysis of public transit options for dispersed recreational users.
4. Analysis of metrics for how vehicles will be reduced in the canyons.
5. Analysis of how tolls will impact dispersed recreation and aid in maintenance and infrastructure of dispersed recreational resources. Dispersed recreational users travel at off-peaks hours.
6. Contain substantive details, including GIS referenceable points for road improvements, including widening, passing or third lane, realignments, or the installation of snowsheds which will have impacts on climbing resources.
7. Contain substantive details, including GIS referenceable points for the gondola, including base station, tower locations, tower heights, and terminus stations which will have impacts on climbing resources.
8. Contain substantive details on the transportation hub including plans for public transit connectivity to the hub from the Salt Lake City Airport, as well as along the Wasatch front and back.
9. Contain substantive details on the transportation hub Alternatives to the "Gravel Pit" location which is on private land, currently in use for the foreseeable future (5-7 years)

and may not be available afterwards. The transportation hub Alternative should include locations utilizing public land, namely part of the Old Mill Golf Course.

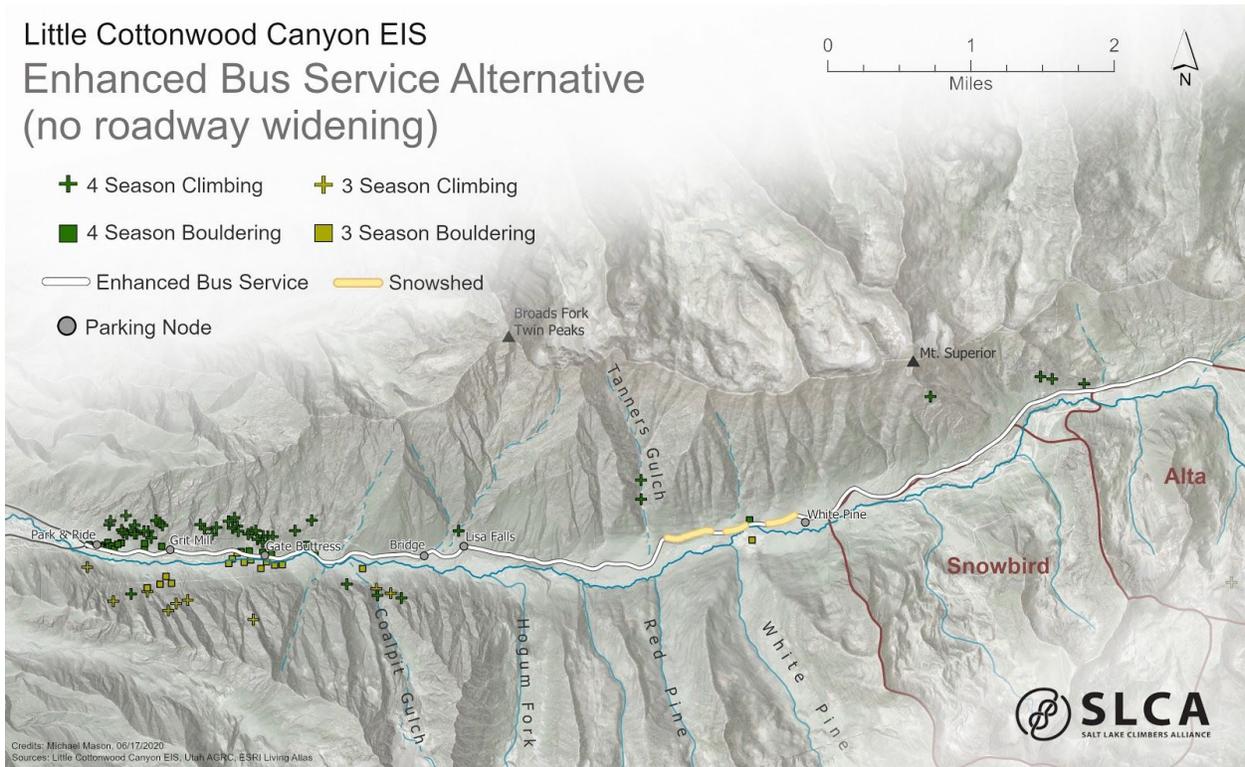

10. Contain details on utilization of transportation when multiple forms are required. That is, will people drive to a transportation hub, take a bus, then a final bus or gondola over just driving directly to the destination?
11. Contain capacity analysis for the additional parking at White Pine Trailhead. It is proposed to expand the parking at White Pine Trailhead to well above the recommendations without any analysis.
12. Contain details on the environmental impacts, including visual, auditory, wildlife habitat. As well impacts to the scenic byway designation.
13. Contain analysis that there will be continued traffic growth in the canyons. The ski resorts have a finite capacity and will not be able to expand.
14. Contain analysis to economic feasibility of a running gondola and how it would be operated such as via a private/public model.

Alternatives

Again, the SLCA supports the **Alternative of Enhanced Bus and no additional roadside capacity with the caveats above.**

The SLCA gathered input from the local climbing community in order to provide an inclusive climbers' perspective. To date over 90 comments have been received. These comments and concerns have been considered and summarized below. Ultimately, the SLCA continues to advocate for **year-round** dispersed recreation access to climbing resources with transit solutions that accommodate appropriately for traffic safety as well as current and future access to climbing resources. Growth trends in climbing as a sport are increasing as is the use of outdoor climbing resources in LCC. The SLCA overlaid main climbing areas on UDOT's Alternatives to better understand the breadth of the impacts to the climbing resource in the maps below.

1. Alternative Enhanced Bus - no additional roadside capacity

Pros

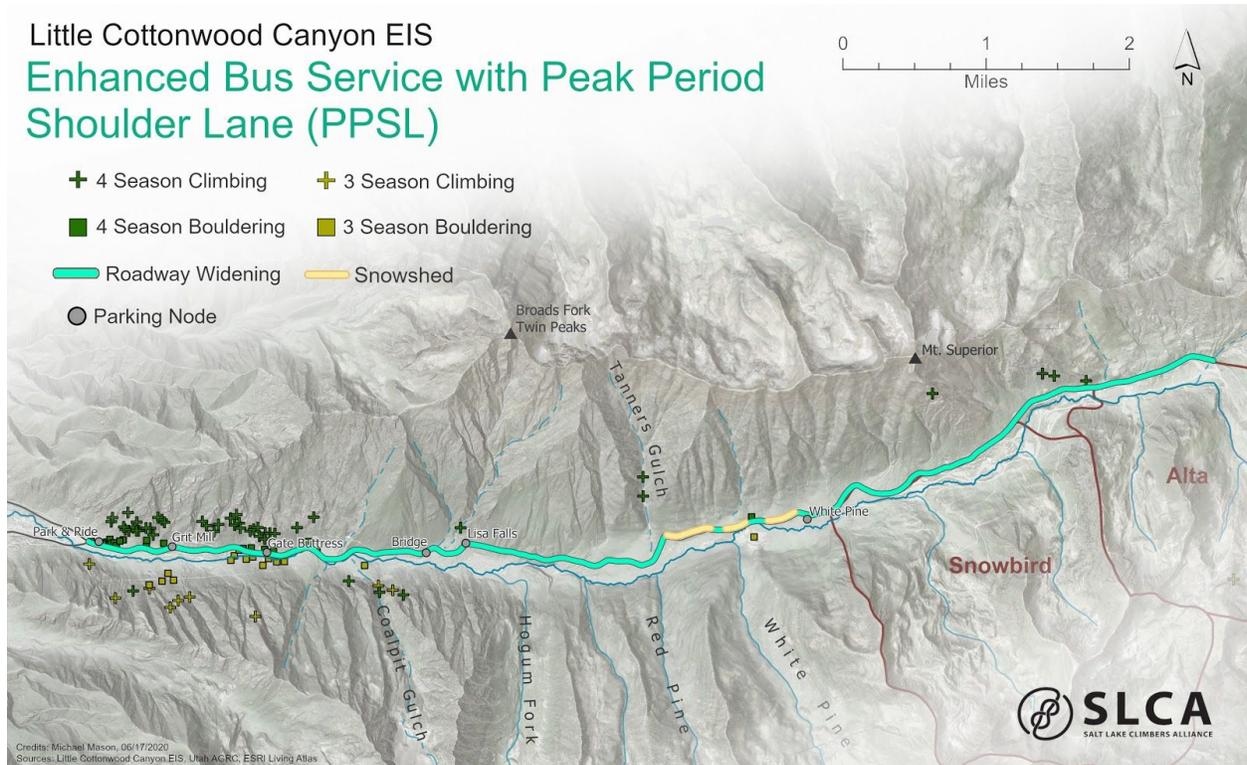

This Alternative would have the least impact on climbing areas, especially those that exist on the roadside or within proximity to gondola infrastructure. The other two Alternatives are ski resort centric and fail to acknowledge climbers and other dispersed users as a substantial user group. This Alternative would leave the viewshed open for the enjoyment of climbers and would also limit noise pollution. Enhanced busses would be a versatile asset that allows for a trial and error solution and would encourage more ridership and use of the public transportation resource. Additionally, this Alternative would require minimal environmental disruption to the canyon. Further, canyon transportation is needed during weekends which is when city transportation is reduced. As such, the buses that run on the weekends can be utilized during the weekdays; thus not be idle.

Cons

This Alternative currently lacks bus or shuttle capacity and pull outs to serve dispersed recreational users. Without capacity and pullouts people will not alter their habits and continue to use personal vehicles. There needs to be an analysis on the lack of vehicle capacity limitation or toll included in this Alternative as no one will be encouraged to take public transit. Electric busses or shuttles need to be vetted considering anthropomorphic climate change. Closing roadside parking during the winter months will negatively impact access as climbers access the

whole of the canyon year-round. The Alternative needs details on the proposed avalanche mitigation in the form of snow sheds which will have considerable impact on climbing access.

2. Alternative Enhanced Bus - with roadway widening for peak period (shoulder lane)

Given the potential impacts to the Gate Butress parking and roadside climbing resources, as well as the extent of the roadway widening, this Alternative must be fully defined and analyzed so as not to impact climbing resources and trails that the SLCA and the community have invested in substantially. Avoidance and/or mitigation of impacts to climbing resources from cut and fill and other construction activity within and outside the roadway widening must be analyzed. Overall there must be detailed analysis of the impacts of widening of the roadway on recreation in the canyon.

Pros

Adding an additional lane would allow the passing of slower traffic, and would open up more space for pedestrians and cyclists in the summer allowing more flexible use of the roadway. Having the bus only lane would incentivize skiers to take the bus and not drive in their own vehicles.

Cons

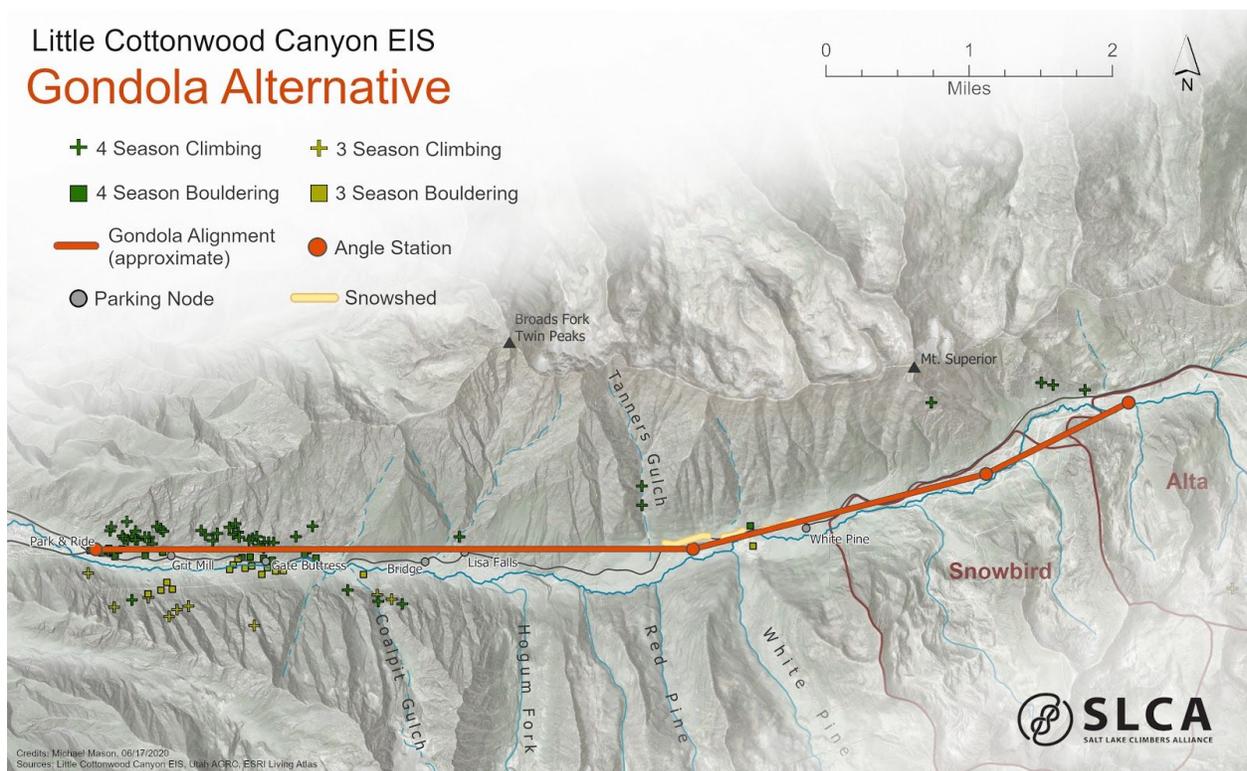

Some of the most popular climbing/bouldering areas such as the Secret Garden, Cabbage Patch, 5 Mile, the Hill and others are all within 30 feet of the roadway. Understanding their location in relation to any proposed changes to the roadway is critical to understanding any

impacts to these recreational resources. The EIS must have substantive details of roadway widening including estimated cut and fill as they relate to climbing resources.

There are high capital costs and a long construction time for any road improvements. This plan would also drastically compromise parking at climber trailheads. The statement from Appendix C, “The presence of the PPSL would not allow roadside parking on S.R. 210 at any time of year.” contradicts the attached Alternative that infers roadside parking would be allowed when beyond a quarter mile from developed trailhead parking. Adding a new lane would have a very significant environmental impact in the canyon. Again, electric busses or shuttles need to be vetted considering anthropomorphic climate change. The Alternative needs details on the proposed avalanche mitigation in the form of snow sheds which will have considerable impact on climbing access.

3. Alternative Gondola - with bus from mobility hub - no additional roadway capacity

This Alternative needs a detailed economic feasibility study of the gondola and its operation. The gondola Alternative also needs a detailed engineering study showing specific impacts to recreation in the lower part of the canyon. Including the lower LCC Park & Ride and impacts to the Alpenbock Loop and Gate Buttress trail networks. The Alternative needs substantive analysis of the visual and noise impacts as well as the impacts to the user experience by the gondola. Further, the Alternative needs substantive analysis of the impacts of the gondola to the Scenic Byway designation as defined by Utah Administrative Code section R926-13.

Pros

This Alternative would allow for continued travel into the canyons during road closures due to hazardous winter conditions. It would potentially reduce carbon emissions from vehicles.

Cons

The gondola is ski resort centric and would most likely only be utilized during the winter months as during the other months the ski resorts are either closed or have a greatly reduced visitation and traffic is not an issue. Thus, it would lack capacity, especially given parking would be very limited at the base station and people will not be inclined to take a bus from a transportation hub. During weekdays of the winter months, when traffic is light, people will not be motivated to use the gondola as it will require parking at a transportation hub, waiting 10-15 minutes for a bus, riding for 10-15 minutes, waiting 5 minutes for the gondola, riding for 40-45 minutes, etc. Whereas driving will be much faster and convenient. Because of these factors, the gondola needs a detailed economic feasibility study of its operation.

The gondola and its associated infrastructure will negatively impact the viewshed of the canyon, especially for climbers on the north side of the lower canyon. The added noise will detract from the user experience. Additionally, it does not service dispersed recreation users, therefore offering no benefit to climbers. The gondola would require infrastructure that will be expansive and pose unknown errors, challenges, and problems. There would need to be infrastructure at the base of the canyon leading to impacts to the Wasatch Boulevard communities as well as limiting access to the Alpenbock Trail network. Towers need to be built where infrastructure does not currently exist and would likely be placed adjacent to or within close proximity to climbing resources that could potentially force them to be closed. Overall, the gondola would have a large and lasting impact on LCC without benefiting the majority of the users.

Pedestrian Safety

While pedestrian safety at Lisa Falls with a cross walk and signal is addressed, it is not addressed throughout the canyon. For instance at the Gate Buttriss parking lot across the road to the pipe that the public uses to access the Little Cottonwood Trail. Pedestrian safety needs to be considered at the mouth of the canyon where during the winter months climbers cross the road from the Park and Ride lot to access the “Scruffy Band” for ice climbing.

Gate Buttriss Parking

The Gate Buttriss parking lot is currently on land privately owned by The Church of Jesus Christ of Latter-day Saints and leased by the SLCA and the Access Fund. To that end, substantive conversations need to be had between these parties regarding future ownership and development.

The Gate Buttriss parking lot capacity in the document is significantly reduced compared to current use levels. At times there are 50 to 80 vehicles parked in the Gate Buttriss Lot and on both sides of the roadway. From April 1st to November 24th, 2019 over 14,500 individuals were

recorded on an infrared trail counter at the Gate Buttness trailhead, indicating the high level of use of this property for the general public's enjoyment. This number does not include all users who accessed the property during that time. Some were parked alongside the road and used side trails to access the climbing resource. Further, congestion is compounded in this area due to the parking at the large pull out adjacent to the pipe bridge to the east on the southside of the highway. Without overflow parking and/or a viable bus or shuttle option, recreation access would be severely limited if roadside parking is eliminated in this area under the current parking lot design.

Again, parking needs in this area must be fully analyzed. The proposed 21 sites and no roadside parking within a quarter mile of the Gate Buttness is not adequate for current use let alone for increased future use. There must be public transit options. Leaving the Gate Buttness lot unimproved allows for more parking than what is potentially proposed.

* * *

Overall, SLCA is very concerned that the draft EIS report does not adequately analyze the impacts of the Alternatives on dispersed recreation, especially in the lower portion of Little Cottonwood Canyon.

Ultimately, the SLCA continues to advocate for year-round dispersed recreation access to climbing resources with transit solutions that accommodate appropriately for traffic safety as well as current and future access to climbing resources. Growth trends in climbing as a sport are increasing as is the use of outdoor climbing resources in LCC. This use needs to be appropriately considered in UDOT's Alternatives. The SLCA is willing and able to answer any questions about our comments or provide additional information on climbing in the canyon.

Sincerely,

RE: Little Cottonwood Canyon Environmental Impact Statement
Comments regarding Draft Transportation Alternatives Report

Dear Mr. Van Jura,

Thank you for the opportunity to provide comments on the Little Cottonwood Canyon Environmental Impact Statement (the EIS) Draft Transportation Alternatives Report. The Town of Alta (the Town) provides municipal services, including police and public safety, to our residents and to hundreds of thousands of annual visitors to Alta in partnership with the Utah Department of Transportation (UDOT) and numerous other entities. State Route (SR) 210 is Alta's sole transportation corridor and route of access. The Town has participated diligently in every transportation planning initiative focused on Little Cottonwood Canyon (the Canyon) over the past several decades and we look forward to the next steps in the EIS process.

General Comments

As we have all learned more about during the earlier phases of the EIS, non-resort recreation system capacity in the Canyon is determined by the 2003 Wasatch-Cache National Forest Plan. Both UDOT and USFS stated previously that the transportation system contemplated in the EIS is intended to deliver passengers to Alta Ski Area and Snowbird, and since ski area capacity is not regulated by the Forest Plan, increases in transportation system capacity contemplated in the EIS will not violate Forest Plan provisions or otherwise impact natural resources outside of ski area permit boundaries. We find it unlikely that all passengers on a future transportation system in Little Cottonwood Canyon will remain within the ski area boundaries, and hence we question the assumption that ski area infrastructure will effectively mitigate environmental impacts from increased visitation to the Canyon.

The alternatives are focused narrowly on transporting ski area visitors, during ski season because, as we understand it, ski season ski area visitation, and the concentration of that visitation during

peak travel periods related to ski area opening and closing times, is the primary driver of congestion in the Canyon. However, we are concerned that this narrow focus will disadvantage other Canyon users and may impair future adaptation of the transportation system as trends in seasonal visitation shift. UDOT can mitigate these problems by doing the following:

- partner with local entities to ensure station-area infrastructure facilitates use of the transit system by canyon residents, dispersed recreation visitors, non-ski season visitors, and local business employees.
- prioritize multi-modal access and functionality at trailheads throughout the Canyon.
- rigorously evaluate the capability of each alternative to facilitate egress from and access to the Canyon in the event of an emergency, such as extreme avalanche hazard, wildfire, landslide, or earthquake, and ensure that all user groups, including dispersed recreation visitors, residents, and other persons present in the canyon for purposes other than skiing at Alta Ski Area or Snowbird, are considered in this evaluation.

Construction of a bus or gondola based transit station in Alta will fundamentally alter the shape and function of local transportation infrastructure, alter Alta's world-class mountain landscape, create substantial environmental impacts in the headwaters of Little Cottonwood Creek, and create significant new demand for municipal services, including water, sewer, fire protection, police and public safety, and other services. UDOT should engage the Town on all feasible steps of the planning process for an Alta transit station and assist the Town in providing municipal services to any new transit facility development.

The outcome of the process to perfect a UDOT easement for SR 210 through Alta may have profound impacts on traffic and parking regulations and their enforcement by the Alta Marshals Office, and on general access to destinations in Alta such as residential and recreation amenities in Albion Basin. We urge UDOT to work with the Town in determining the eastern terminus and the lateral boundaries of the easement as it passes through Alta.

Comments on Gondola Alternative

The gondola alternative assumes the gondola will operate when SR 210 is closed for avalanche control work, and due to that assumption, the alternative does not include snow sheds over SR 210 under key avalanche paths. The Town urges UDOT to consider the following issues in further evaluation of the gondola alternative:

- Firing military artillery over occupied ski lifts, open roads, or other contexts in which civilians may be exposed to artillery fragmentation, explosive-triggered avalanches, or other hazards is generally discouraged (or prohibited) where artillery is used for avalanche mitigation. UDOT Avalanche, the Town of Alta, and other local partners conduct avalanche mitigation with artillery over occupied structures in Alta only when all outdoor areas have been cleared and interlodge travel restrictions have been implemented by the Alta Marshals Office, per Town of Alta Ordinance 5-4-1¹. It is our understanding that while UDOT is implementing various remote avalanche control systems in the upper Canyon, there are no alternatives to military artillery being

¹ <https://codelibrary.amlegal.com/codes/altaut/latest/altaut/0-0-0-1634>

contemplated for the mid-Canyon avalanche paths, and its use will require closure of whatever transportation system exists in the future while that artillery is being fired.

- Even if a gondola is relatively safe to operate during elevated avalanche hazard, it is often very unsafe for the general public to move around freely in the Canyon during elevated avalanche hazard, and it is frequently necessary for the Alta Marshals Office and other partners to impose interlodge travel restrictions many hours before and after avalanche mitigation work is conducted. This requirement means either that passengers arriving in the Canyon on a gondola would need to shelter-in-place at gondola terminals until avalanche hazard has decreased, or that the gondola would need to remain clear of passengers during elevated hazard and ongoing avalanche mitigation work.
- The absence of snow sheds from the gondola alternative means that closures of the gondola, and of SR 210, may take place as frequently as they do today, and for durations consistent with those associated with present-day avalanche mitigation missions. If SR 210 is closed as frequently as it is today, and if a gondola cannot transport passengers due to artillery use, interlodge travel restrictions, and elevated avalanche hazard, the gondola alternative as it is currently designed may not improve mobility and reliability for visitors to LCC, or provide an option for emergency egress from the Canyon, as effectively as other alternatives.
- UDOT should consider incorporating snow sheds under key avalanche paths into the gondola alternative, or creating an additional alternative including both a gondola and snow sheds.

Do not hesitate to reach out to me or to Town of Alta staff if you would like to discuss our comments. We appreciate the engagement your team has provided us throughout the EIS process, and we look forward to the remainder of the project.

Sincerely,

Harris Sondak, Mayor

Public Comment
LCC EIS – Eric Kraan

Primary objective for S.R. 210: to substantially improve safety, reliability, and mobility on S.R. 210 from Fort Union Boulevard through the town of Alta for all users on S.R. 210.

Safety, Reliability, and Mobility does not have to be a Zero-Sum Game. Which is why I find it absolutely incomprehensible that UDOT continues to resist all calls to employ a slower Design Speed along the 2.2 miles of the urban segment of SR 210?

It should be noted that the “Five-lane” alternative is a misnomer. With shoulders wide enough to accommodate a bus it is in reality a 7 lane alternative. Actually the proposal would surpass in width the existing Wasatch configuration at the gravel pit, and as anyone familiar with that area, nobody drives at or below the speed limit at that location of Wasatch. Therefore, it is reproachable that UDOT was unable to refrain from piling on more lanes and more width and allow this alternative to reach stage 2. Perhaps this is as a result of their continued embrace of high speed – high capacity residential destroying designs.

The only other alternative is the “Imbalanced” proposal, which is not much better, it is still wider than what regional and local plans call for the area, and it would still allow car traffic to fly through a residential area generating levels of noise, pollution, and root a sense of danger to everyone that lives in the adjacent areas. It is not as if UDOT is unaware of what this road design would create, since they propose to roof the overhead views with pedestrian bridges because it would be too dangerous for people not inside a 4,000 pound capsule to navigate their monstrosities.

- a) Safety –historical safety data is presented, but UDOT fails to report that traffic reports show that in an average about half of

all users ingress or egress at one of the 13 points intersection from local streets and collectors that belong to the city of Cottonwood Heights, where residents rely heavily on this corridor to access daily life necessities. Perhaps that should indicate that while S.R. 210 is categorized as a Principal Arterial, its function of connecting major activity areas means that this area is a terminus and should be treated differently due to the fact that it must distribute most of the traffic at this point rather than carrying it forward to another destination. As I said, there are 13 access points of which 7 are not signalized. This means that about half the users of Wasatch will be exposed daily to the potential of cross traffic collisions at speeds in excess of 50 mph, a condition that threatens users to serious injury or death. Besides the speed factor, the extra lanes proposed by either one of the two alternatives would nearly double the conflict points at which these accidents could. This concern has been repeatedly communicated to UDOT for many years and increasingly throughout this EIS period. A report often cited by experts in the subject indicates that *“For a side impact with a delta-v of 30 mph, the risk of fatality is approximately 25%. For a delta-v of 40 mph, the risk of fatality is approximately 85%.”* The complete study can be found at this link:

https://nacto.org/docs/usdg/relationship_between_speed_risk_fatal_injury_pedestrians_and_car_occupants_richards.pdf

- b) Wildlife Safety- If a car travelling at 50 mph can impale a car passenger in a broadside collision; we know that the chances of wildlife that migrate along this area would find it more difficult to navigate successfully across. No reports are made available through the EIS about present conditions, migration patterns, and mitigation practices that could address this danger to animals as well as users of this road.
- c) Sound – Wasatch is a noisy street in its present condition and additional car traffic at high speeds will increase such noise

and reduce the quality of life of an established residential area, as well as impact natural habitat at the foothills between the two canyons. A study on noise from car traffic states “*that reducing vehicle speeds from 40 to 30 mph is as effective as removing one half the vehicles from the roadway.*” While no definitive studies have been conducted or cited within the EIS about Wasatch to establish the current levels of noise and potential future conditions at different design speeds, lane configuration, for either one of the current alternatives presented, UDOT should not be blind to the potential result of acting without information on this subject. As a resident of the adjacent land, I can assure you that reducing the noise by half would not only help mitigate human conditions, but would also help wildlife populations. For information regarding noise levels from car traffic at different speeds please click this link:

<https://nonoise.org/resource/trans/highway/spnoise.htm>

- d) Active Transportation- The current alternatives for Wasatch blvd and even for segments of S.R. 210 up the canyon fail to account for significant and key data about the type of users that currently use, and could in some future time become significant users of a reconstructed roadway. For example, EIS makes no mention of data readily available to UDOT through Strava Metro, which would point out that within the calendar year of 2018 there were 74,000 distinct cyclists that performed more than 1.2 million individual trips through Wasatch, making this one of the most utilized segments of roads utilized by the cycling population. Strava data does capture mainly highly confident cyclists. What is certainly missing in the EIS is the identification of users that currently use the roadway to traverse the dangerous road but do so for trips of less than 1 or 2 miles. Eliminating a significant number of short trips by local users could actually do more to reduce traffic congestion than any other alternative being currently proposed. Inducing more

active transportation trips across and along the corridor through high-quality and low speed designs could provide a greater ability for Wasatch to increase mobility, reliability, but more importantly SAFETY. Regretfully, there are not signs that UDOT has conducted any “Walkability” or “Bikeability” audit to determine the current conditions and explore the potential to increase these forms of mobility as a viable option to reduce congestion in Wasatch. Salt Lake County’s Health Department offers these services at no cost to municipalities within the county should the cost be an issue. I would also strongly suggest that the UDOT demonstrates that they are following current FHWA Bikeway Selection process before presenting any sort of bicycle infrastructure as part of their preliminary design. Consideration to the City of Cottonwood Heights Master Plan calls for a low stress bike facility of protected bike lanes for people to cross as well as to travel along the corridor. A condition that neither of the current alternatives fully implements.

- e) Adjacent Land Use- S.R 210 is categorized as a Principal Arterial, serving major activity centers and highest traffic volume levels. Serving, is perhaps the most important word that describes this roadway. Traffic studies show that about half the traffic of Wasatch departs or arrives inside the city limits of Cottonwood Heights. The single largest destination served by this roadway is the city of Cottonwood Heights. Therefore, it is concerning that the EIS fails to explicitly describe and recognize the growing density of housing, commercial, and recreation destinations along this 2.2 mile segment of Wasatch. As stated previously there are 13 intersecting roadways into Wasatch, a gas station, a hotel, restaurants, a park, fire station, there are plans for a dog park to be built in the near term alongside Wasatch. There are also residences facing Wasatch with driveways that back into Wasatch directly. So while UDOT

refuses to accept calls from the community this roadway serves to reduce the design speed of the roadway, it is in the best interests of the agency to recognize the environmental elements adjacent to the road that will be impacted by the speed, volume, and noise while trying to gain approval from the EPA. Perhaps even show sensitivity to the surrounding environment by adopting a low design speed.

- f) Air Quality- There is no mention that I can find in any of the reports regarding air quality impacts by either one of the alternatives presented, which is a significant concern for people that live within a valley that sees significant health adverse events due to winter inversions.

As for the Criterion Elements by which the EIS states it will proceed to select through their level 2 process:

- 1) Cost: Enhanced Bus service (No additional capacity). It is plain to see that the savings in implementing this alternative far outweighs the other two alternatives.
- 2) Consistency and compatibility with local and regional plans: Enhanced bus service (No additional capacity) – this plan again best meets goals already established by regional and local plans. It utilizes already established or planned mobility hubs, while it retains as best possible the integrity and widths of the roadway up the canyon. The very mention of a Gondola has already attracted speculators in what would result in a MAJOR change in local and regional plans – this late development alone should be reason enough for the EIS to disqualify the Gondola alternative.
- 3) Compatibility with permit requirements: Enhanced bus service (No Additional capacity) – there is no need to permit road expansion up the canyon, no need to use federal land to install

gondola posts, buses are already permitted up the canyon, etc.

- 4) Impacts to natural resources: Enhanced bus service (No Additional capacity) – There is less visual impact compared to the gondola, less potential for water runoff to vital watershed compared to wider roads up the canyon.
- 5) Impacts to build environment: Enhanced bus service (No Additional capacity) – By the numbers presented, the gondola would still impact the same amount of private properties but would require more community facilities to be created at a cost to tax payers as well as potentially been built at historical quarry site near the mouth of the canyon.

Wasatch Alternatives:

- 1) Cost: Imbalanced – numbers shown makes this decision obvious.
- 2) Consistency and compatibility with local and regional plans: Neither option meets this requirement - Local master plan shows a blvd with a median, 2 lanes used for traffic year round and 2 lanes for dedicated bus service and/or bike shoulders when bus service is not used in the summer. Meanwhile regional plans call for no more than a 5 lane configuration. The Imbalanced alternative is the closest to this plan although it adds an additional permanent southbound traffic lane making it 6 potential lanes rather than the maximum of 5 presented by local and regional plans. The 5 lane alternative which would use the space provided for bicycles as dedicated bus lanes really make it into a 7 lane configuration which diverts the furthest from both local and regional plans. Neither option is compatible or consistent with any plans and as such neither one scores well in this category.
- 3) Compatibility with permit requirements: N/A. I am not aware there are different requirements. Perhaps the EIS team can

explain better this issue within their documents and show if there is a significant deference. Obviously the current design does not meet any standard and changes have to be made, I only wish that UDOT would apply themselves to arrive at a better alternative than the ones we have at hand.

- 4) Impacts to natural resources: Imbalanced. In theory this would be the narrowest configuration. The impact to storm water drainage systems by the sheer amount of pavement that this road will create should be minimized. As stated above, there are no studies that show wildlife impact by road width and speed, there are no noise studies presented, there are no air quality studies, and there are no Walkability or Bikeability Audits that show impacts to other environmental concerns.
- 5) Impacts to build environment: Both would equally impact negatively the built environment. If overhead directional lights for reversible lanes were rejected because they would impact the built environment, then pedestrian bridges will do the same. Both would take a house and ran a neighbor away from our community, both fail to provide safe(r) access to local traffic to their local streets and would actually make it less safe. Both would divide rather than unite a community that is split by this road while it vacillates in trying to provide better mass transit options to the canyons, but by creating a design that forecasts at worse an LOS of C by 2050 through exceeding capacity called for by local plans for this corridor, UDOT is actually ensuring that people will be less likely to adopt alternative modes of transportation through ensuring that car travel will face negligible delays.

#6521

TriTrack Motors

Little Cottonwood EIS comment
defending "DUAL-MODE" technology
and US patents and Chinese patent

**TriTrack Motors designs, develops,
manufactures and sells high efficiency
fully electric vehicles.**

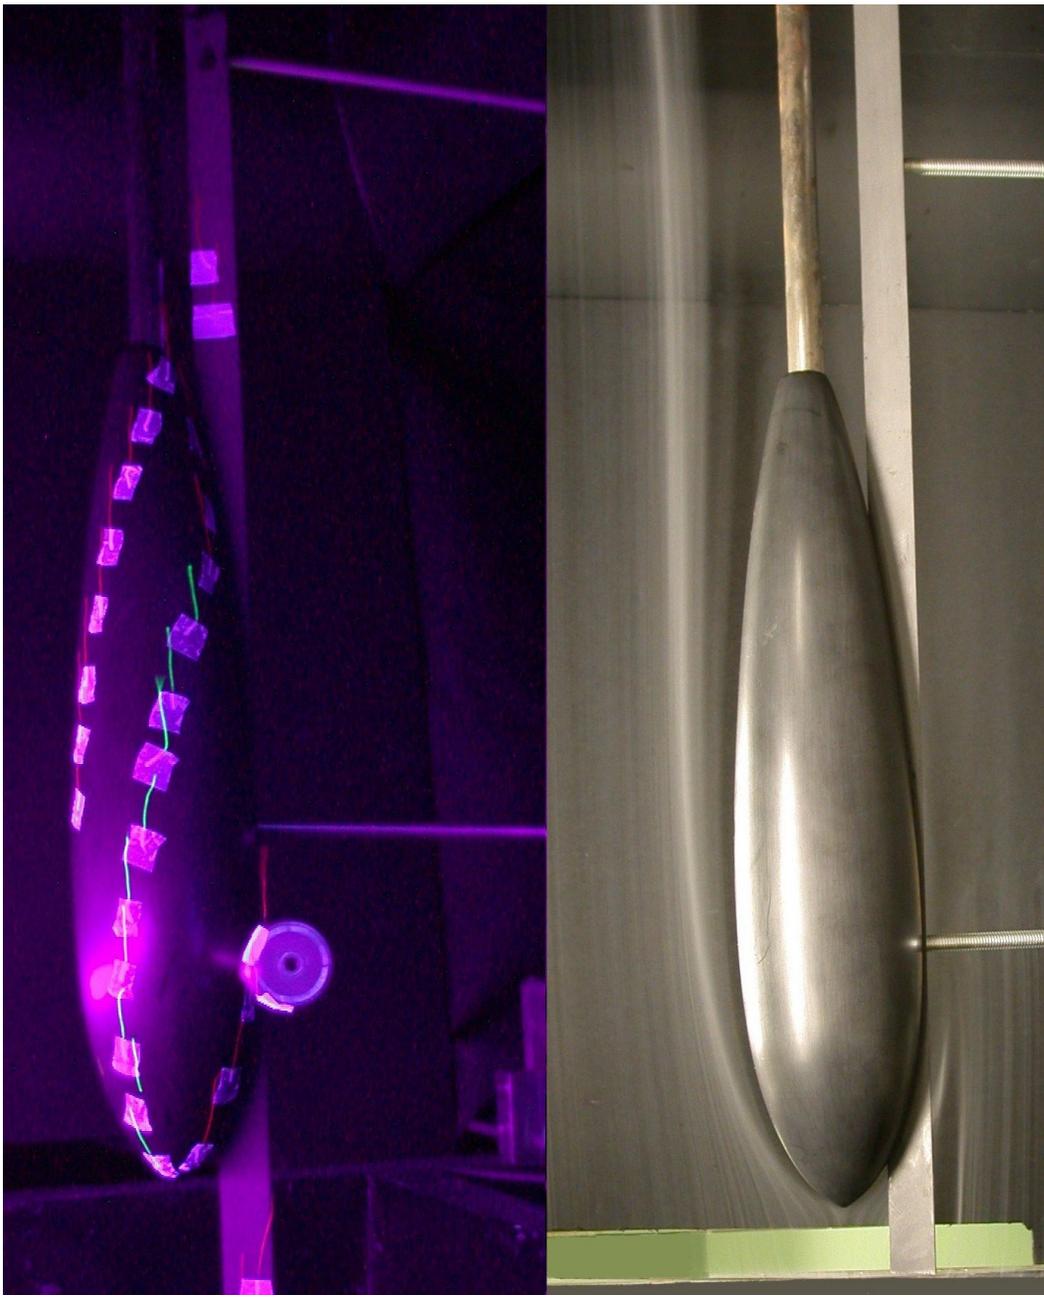

Competitive Bids

- The lowest qualified bidder must be given the public's construction contract by law. This shifts the task of eliminating a lower cost concept to be called unqualified so it cannot show up equally at the bidder's table. The employee of the state tasked with disqualifying concepts is not an elected official and has no requirement to have any advanced physics, aerodynamics or chemical engineering background. Without the educational tools how can that person disqualify a competitor? (D.A.V.E. specifically) This comment discussion is about the EIS and no one seems to talk about the number of trees that will be destroyed, cut back and fatally harmed in bulldozing thirteen mountain forest acres. The irony is that people are paying to come to Utah to see what is left of nature. As we pave more and more of the attraction it will be less and less appealing. Building bus lanes in particular means more underutilized pavement. Extruded (patented) guideway is a minimalist approach to rolling surfaces unlike roads that maximize tire rolling surface taking up forest that does not necessarily need to be destroyed. This route meanders like the cow trail it followed and elevated guideway affords the opportunity to make the travel straight. The beam is an equilateral triangle 14.5 inches on each side so at 17 feet or 23 feet elevation it is not very intrusive. We drill a 17 inch diameter hole every 60 feet for our contact with the forest floor. The vegetation under the guideway will be planted dwarf varieties of trees that will naturally stay away from the high speed vehicles. Upkeep of the land under the guideway is done from the guideway to make sure the dwarf trees stay healthy and push out other taller varieties. As stewards of the public purse it is important to consider dual mode cost fundamentals that are significantly lower than trying to plow in a spare bus lane in this stretch of God's creation.

TriTrack Motors

- TriTrack Motors is manufacturing another dual mode system along with D.A.V.E., Bladerunner, Urbmobile (Cornell Aeronautical Lab) and RUF built in Denmark in June 28th 2005
Copenhagen University College of Engineering. All endorsed by Dr. Jerry Schneider professor emeritus Washington University.

Wind Tunnel $Cd=0.07$

- Wind tunnel test measured Cd of 0.07 in the engineering building basement wind tunnel at The University of Texas Austin. Our large factory real estate closes this month on the 20th located on the intersection of 183A and FM 2243, SW corner. We have two prototype TriTrack bodies and machined parts for these two vehicles. The city of Leander Texas mayor is in favor of building a demo from our factory acreage to Austin Community Collage Campus then on to the Red Line Train Station for CapMetro. This 1.2-mile long demonstration will get up to full speed for endurance testing.

Advantages

- The advantage of TriTrack over DAVE and RUF is our aerodynamics and lower rolling friction. (rolling coefficient .004) Our guideway is smaller so less visual clutter up in the air. TriTrack made with aircraft composites is lighter than DAVE or RUF but when you calculate energy for vehicles at 180 mph weight is a minor factor. At the average big box transit speed of 17 mph a city transit bus uses 4,242 BTUs per served passenger mile. TriTrack with four seats full uses 123.76 BTUs per served passenger mile. No TriTrack vehicle leaves with the seats empty like a fixed route bus does mid day. The two guideways have a max capacity of 27,692 tourists per hour. The single occupancy vehicle demonized by the government is far better for air pollution than big box transit either diesel buses or diesel trains. The best trains use 2,516 BTUs per passenger mile, far more than a SOV TriTrack at 495 BTUs per single passenger with skis in the long private locked trunk. Of course the tourists flew in on an Airbus jetliner using 12,267 BTUs per passenger mile so their sensitivity to clean air is muted.

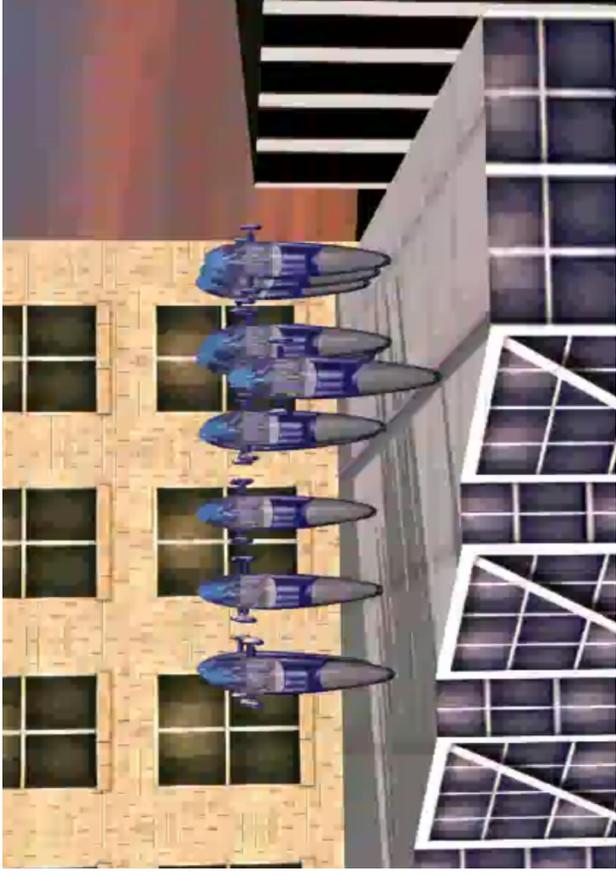

Visual Impact Over Nature

- People devastated God's creation a century ago in this valley building a crooked road on cut and fill unstable land. Cut and fill is easy for the first two lane widths but as the road is expanded ever wider the mountain base gets close and you have to cut into the rock of the mountain or fill into the creek below to add lane after lane and their associated safety guard rails. Adding a bus-only lane that only supplies 3,200 passengers per hour peak and none mid day is going to do a lot of eco damage to the forest because filling on the side of a mountain means 12 feet wide filled 50 feet up the slope side and a lot of shredded old-growth trees.

Diesel Bus Pollution

- Diesel pollution from 3,300 foot elevation change is going to be excessive. Buses already get pathetic fuel mileage but with a steep long incline the diesel engine produces excessive black smoke and soot (PM 2.5 PM 10 Nitrogen Oxides and 260 suspected human carcinogens) as they also get poor mileage. TriTrack is low enough energy that it can be powered by only the sun's radiation. Conventional electric cars on the road today use about four times more energy than a guideway vehicle so although it is possible to cover a large area with photovoltaic solar panels to power the current vehicles as self-driving it will take a very large solar area. About 22.38 pounds of CO2 are produced by burning each gallon of diesel fuel.

Parking

- Parking TriTrack is self-driving and they park on their tail. Each TriTrack takes up ground space of 4.5 feet by 5.5 feet or 25 square feet. Parking American sedans takes 303 square feet each so a packing density of 12X for TriTrack over usual slant in car parking. Campers and RVs need many times more space to maneuver and park.

Purpose Driven EIS

- TriTrack produces zero (actually zero) emissions being powered by the sun's radiation. Building more lanes of pavement directly produces billions of tons of pollution from fossil fuel firing the concrete clinker. In 2016 world cement production generated 2.42 billion tons of CO2. According to the cement expert, highways use 50% of Portland cement so road additions produce 1.21 billion tons of CO2 that are avoidable. Taking out trees by cut and fill lowers nature's ability to turn CO2 back into oxygen. For every tree chopped down in the national forest to make a bus lane, 2.5 tons CO2 is not absorbed annually. Killing an old growth tree to make way for gravel fill takes 50 years to grow back so each tree destroyed represents 125 tons of CO2 not able to be removed. Plowing down mature trees for 8.5 miles is such a shame for a bus idea so deeply flawed from understanding the customer demographic and the resort customer perspective.

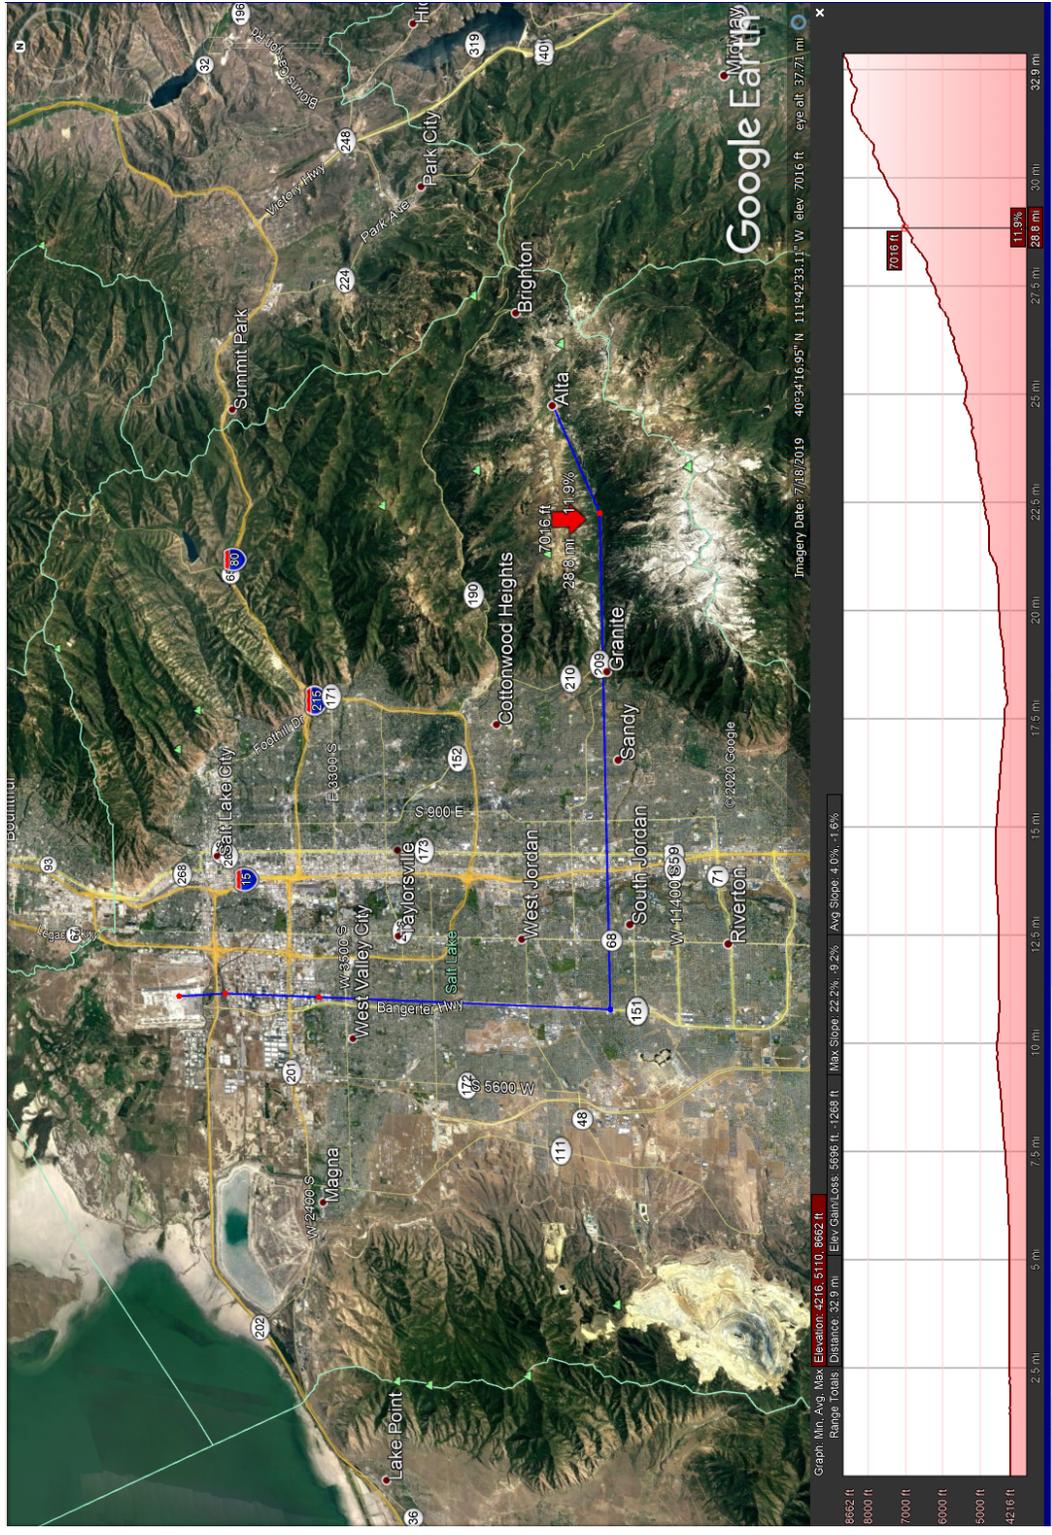

Potential Deaths and Risk

- Construction zone deaths are expected while this bus lane is added. In the US (2006) there were 1,010 fatalities associated with highway construction zones. The risk of years-long construction is too high for just adding one lane that no car is allowed to use or for a tolled restricted Lexus Lane.
- Travel freedom - Dual mode gives you complete access to everything in the state of Utah. If you take the bus you can only go to the limited bus stops.

Health Safety in the Recovery

- Bus, Gondola and COVID-19 -- These big box answers will spread COVID-19 at an unacceptable level decimating the ski industry. Private groupings with UV and chemical sterilization between uses are going to be required for COVID-19 and the future pandemics that we know will come from virus mutations. TriTrack for communal use will be wash-down ready and will provide a strong ultraviolet attack on the virus when the vehicle is empty between families. As a public safety DOT, it is important to consider the 555,000 confirmed deaths from this .12 micron diameter virus. Considering the spread the world has today of 12,500,000 confirmed cases it must be considered by not picking bus or any big box transit with family groupings coming in close contact with each other. Masks are only the minimum we should do to save so many potential \$72,000 each ICU stays.(average intensive care unit cost)

Phases

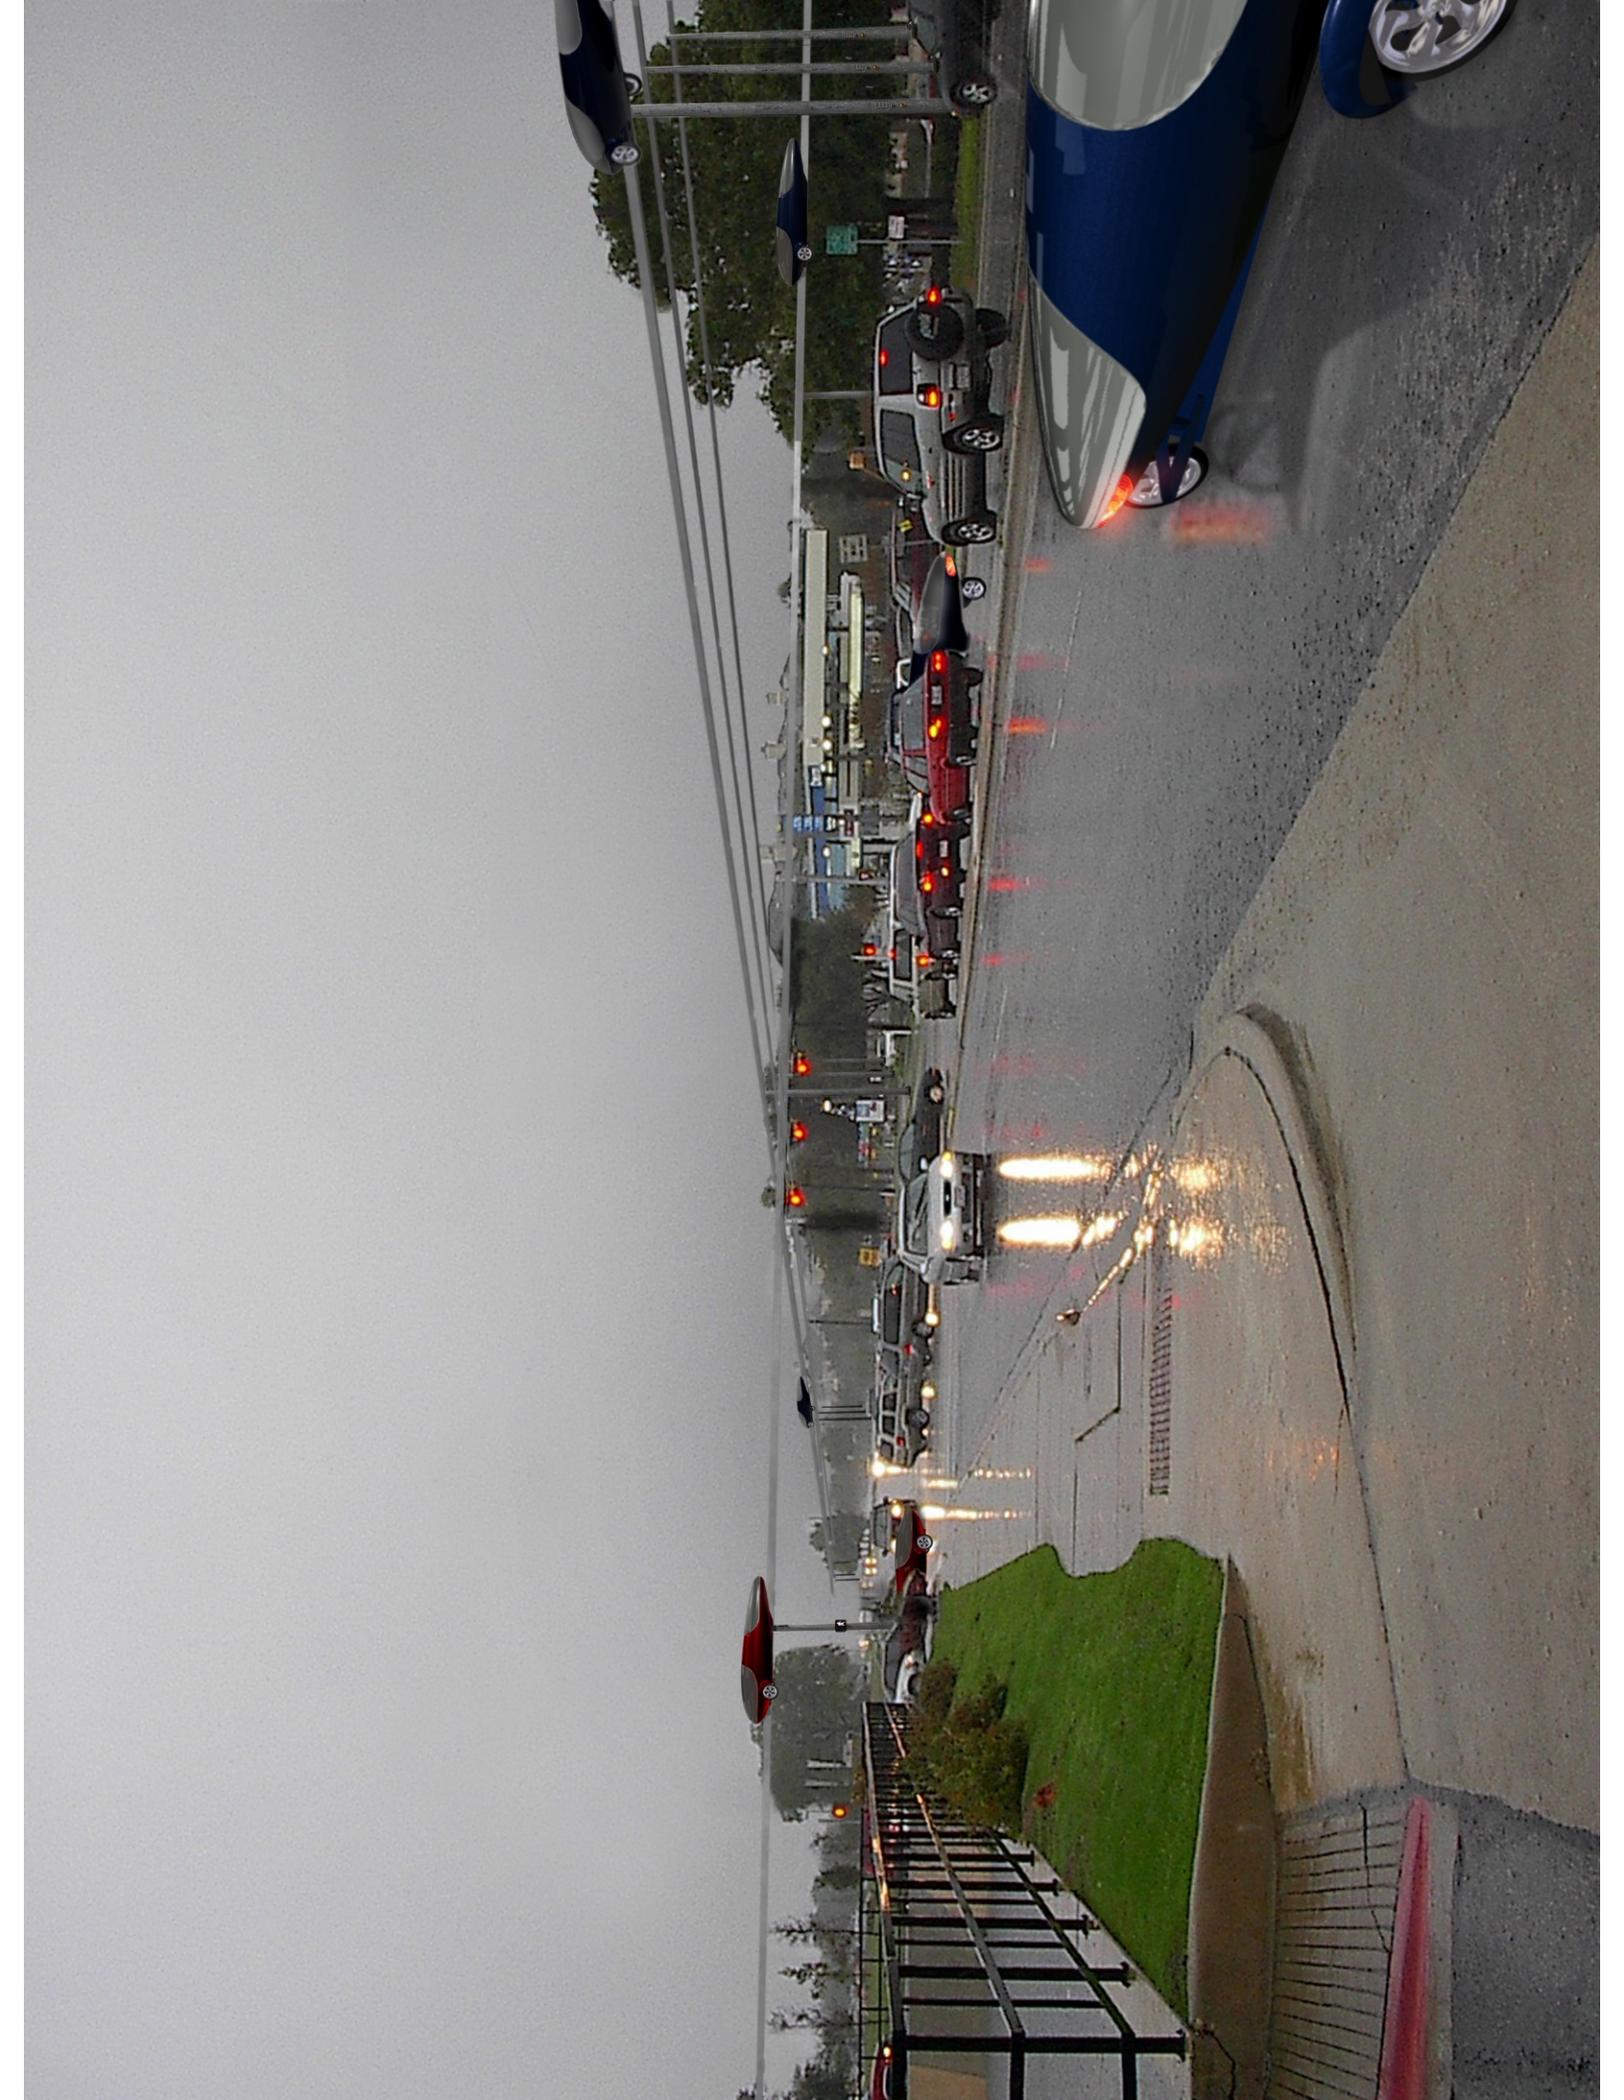

- Phase one is 8.5 route miles in the canyon with a pair of guideways.
- Phase two is adding a high speed connection to the baggage claim building of the airport.
- Phase three is adding a city grid across Salt Lake City allowing any taxpayer citizen to get to the slopes for a quick run down the mountainside after work.

Apologies

- My apologies for the quality of this presentation as I was informed 46 hours before the deadline of the very negative response to D.A.V.E.. Dave Brough is a friend of mine. In the bidding process TriTrack would be one more competing bid as well as D.A.V.E. if not disallowed by the internal processes within UDOT.

Rough Order of Magnitude (ROM)

- The ROM cost for machinery and tooling plus building TriTrack double guideway 8.5 miles long is \$9 million. Initial purchase of 200 vehicles \$3 million. These costs are higher because they are the first units and there is a lot of initial setup and tooling. The route to the airport for phase 2 is 25.3 route miles and ROM \$26 million if given permission to use aviation rights above existing roads (airport baggage claim inside the building, South down 3600W East on 9800S to the canyon guideway) and share electric utility right of way. Phase three, build guideway on every fourth major road in the city to form a rectilinear high speed grid. Entry points at each node per patent 6,923,124 This patent has been issued and "reduced to practice" (official legal designation per my attorney).

Little Cottonwood Canyon EIS Public Comment

I support the gondola option with a base station at LaCaille as the best transportation solution for Little Cottonwood Canyon.

The gondola seems like an effective
safer option to get up the canyon

I support the gondola option with a base station at LaCaille as the best transportation solution for Little Cottonwood Canyon.

The gondola year round would be a
great option! It is a long term solution
and would really help traffic. It would be
awesome to not have to drive a vehicle up
the canyon in the winter.
